The Supreme Command held in readiness, besides the above mentioned three divisions at Denain, other reserves behind the remaining army fronts, and reserved to itself the right of withdrawing forces from the front line when necessary.

On March 20 the attack divisions, protected by aircraft, were drawn up behind the position from which the assault was to be made. The deployment of the artillery and *minenwerfer* was complete and the munitions in readiness. Only the order to advance had still to come. But here the weather threatened to upset all plans, for the direction of the wind was such as would spoil the effect of the artillery's gas, and the fog would make the attack movement difficult for the infantry. By 12 at midday the weather conditions had so far improved, however, that it was decided to carry out the attack on March 21. On that day, accordingly, at 3:30 A.M., the gassing of the Allied batteries began. This was followed by a 3-hours' preliminary bombardment of the British positions by the German artillery and minenwerfer. At 9:40 A.M. the German infantry dashed forward to the attack. The mass of artillery then made a barrage, which, creeping gradually forward, was to pave a way for the infantry into the depths of the opposing trench system.

The attack itself turned out very differently at different points. In the XVII. Army, commanded by Otto von Below, the coöperation of infantry and artillery was not without its hitches. The barrage "ran away from the storming infantry," who only reached the opponent's first position and found itself in the evening before the strongly occupied second position. At Vaulx Vrancourt and to the N. of it, as also at Doignies, the British put up strong counter-attacks, to repel which several 2nd line German divisions had to be put in. The British defended themselves here with great stubbornness against the obvious danger of being shut off on the Cambrai bend.

The II. Army, commanded by von der Marwitz, pushed through to the line Gonzeaucourt–E. of Epéhy–Templeux le Guérard–Le Verguier. Their main battle raged around the high-perched village of Epéhy, which the XXIII. Reserve Corps failed to take in spite of heroic efforts. With this army only a small portion of the second line divisions needed to be brought up. There were no serious counter-attacks.

The greatest success was achieved by the XVIII. Army, commanded by von Hutier. Its right wing pushed through the second British position and took the Holnon Wood. The centre got through beyond Savy, Dallon, Fontaine les Clercs, and the left wing took Urvillers, Essigny le Grand and Beney, and forced the Oise crossing. The XVIII. Army also took the most booty.

On the whole a great initial success had been achieved. Everything depended upon whether it could be successfully developed.

The German Supreme Command was determined to order the continuation of the attack according to the results of the first day's fighting. It allotted the first reinforcements brought up to the XVIII. Army and the left wing of the II. Army, directing the XVIII. to ease the advance of the II. by pushing forward on Tertry. The II. Army was likewise to put its weight upon the left wing. On the second day the fighting was heavy, the chief burden falling on the infantry. A systematic preliminary bombardment was impracticable on account of the progress made on the first day, and it was a difficult matter to pull the batteries through the obstacles and shelled areas. The heaviest and most thankless task was once more allotted to the XVII. Army. Its infantry penetrated the second British positions time after time, only to be forced back just as often by strong counter-attacks assisted by tanks. Not until the afternoon did they succeed, with considerable losses, in taking Croiselles, Vaulx Vrancourt and Morchies, and entering Hermies. To do this they had to be assisted by large portions of the third line. In the evening the army found itself once more up against another strongly held British position on the line Béhagnies, Beugnâtre–Beugny.

The II. Army had also had more hard battles to win. It took Epéhy and pushed forward as far as Fins–Longavesnes-Marquaix–Coulaincourt, capturing considerable booty. It was not able to interfere with the British evacuation of the Cambrai bend, owing to the slow progress made by the XVII. Army.

The XVIII. Army made a good advance encountering only slight resistance. It stormed Feuquières and forced a crossing over the Crozat Canal between Jussy and Tergnier. For March 23 General Ludendorff ordered an attack by the XVII. Army in the direction of Bapaume, to supplement the success of the II. Army, and an advance on both sides of the Somme by the II. and XVIII. Armies.

This day at last brought the reward of their heavy labour. The XVII. Army met with sharp opposition even now from newly put in divisions, but was able to take Monchy, Driencourt, St. Leger, Beaumetz, Lebucquière and Havrincourt.

The II. Army encountered heavy resistance on the right wing only, and was able to reach the line Neuville–Etricourt–E. of Bouchavesnes–E. of Péronne–the Somme at Brie, with only slight opposition. The XVIII. Army took the Somme crossing at Béthencourt by fighting, stormed Ham and crossed the Crozat Canal. Its left wing corps (the IV. Reserve) repelled the counter-attacks of 3 French divisions that were being hurried up as reinforcements in a bloody battle.

For the next two days the scene remained unchanged. The XVII. and II. Armies advanced towards the Ancre, fighting violently, the II. being more and more hindered by the shelled area of the Somme battle. But gradually a new front arose on the Ancre in front of these armies, stretching southward to the Somme. In the region of Albert the British executed one counter-attack after another, though with heavy losses.

The centre and right wing of the II. Army had, by March 26, reached Thiépval, Beaumont-Hamel, Mametz, Cornoy, Albert and Braye sur Somme. Certain portions veering in from the N. opened a way of advance for the lagging left wing, which was thus able to come up with the rest of the army on March 27 on arriving at Ville sur Ancre–Sailly. Meanwhile the resistance was visibly growing, and it was possible to calculate the point at which it would be equal to the decreasing pressure of the attacking forces.

The XVII. Army had been steadily fighting its way forwards through village after village. In proportion as the opponent's fighting power waned new forces were put in. He seemed determined that there should be no question of rolling up or breaking through his front at Arras under any circumstances. In spite of this the army managed to take Bapaume on March 24, Béhzgnies, Sapignies, Grévillers and Irles on the 25th, and to reach Boiry, Becquerelle, Hamelincourt, Achiet le Grand and Achiet le Petit on the 26th. The attacking power of the army was now exhausted. On the 27th it did no more than capture the village of Ablainzeville and repel the counter-attacks of new British forces with powerful artillery.

The II. Army progressed in much the same way. The XVIII. Army maintained its almost unbroken advance throughout the days from March 23 to 27. By the evening of the 25th it had reached Nyencourt, Curchy, Nesle, Hattencourt–Beaulieu-Bussy, and on the 27th was in possession of Pierrepont, Montdidier, Boulogne la Grosse and Lassigny.

At this point the great battle came temporarily to a close. General Ludendorff had, on the evening of March 26, shaped his plans with the view of dividing the British and French by a gradual left-wheel advance of the II. and XVIII. Armies against the French. To this end the Somme at Amiens, and the Avre had to be reached, and the operation continued towards the S.W. The original plans had thus undergone a complete change in the course of its execution. It would now very soon be shown whether the tactical break-through could still be brought off in spite of the waning of the Germans' strength and the increase of the Allied resistance.

The course of events on March 27 did not come up to Ludendorff's arrogant expectations. It was impossible for the attacking force to know that in the direction of Amiens—the decisive point—the Allies had only very weak forces at their disposal on that day. In this case, as in every break-through, the difficulty of accurately estimating the exact effect presented itself. The difficulties of provisioning, too, made themselves increasingly felt in the shelled area of the Somme battlefield. The supply of munitions ceased, and the establishment of rearward communications had not kept pace with the advance of the attack. From certain signs it was evident that the German troops were not everywhere at their highest level of achievement and endurance. The losses, particularly those of the XVII. Army, exceeded what under the circumstances was the legitimate number.

Ludendorff therefore changed his intention once more on March 27. The XVII. Army was ordered to close down the attack. The XVIII. and the left wing of the II. were to renew their attack on the now isolated French on March 30 between the Somme and the Oise. This attack resulted in the filling out of the German line where it curved in S. of the Somme, and the taking of the localities Aubercourt, Démuin, Moreuil, Sauvillers, Hargicourt, Contigny, Anainvillers, and Rollot—the so-called bridgehead of the Avre. But while the break-through at Amiens failed, the Germans were able to repulse the violent, though disconnected, French counter-attacks in every case. By April 4 the right wing of the XVIII. Army had still been able to take the heights W. of Moreuil. The II. Army reached the western border of Hamel and pushed forward almost to Villers Bretonneux and Hangard. The battle then ceased.

Later repetitions of the attack in the direction of Amiens had no better results. An assault on April 24 by the II. Army in the neighbourhood of Villers Bretonneux, in which tanks were used, made good progress at first but could not hold the ground gained. The battle ended therefore without any clear decision. Certainly the Germans had achieved an initial success such as had been denied to the Entente during the preceding 3½ years of hard struggle in spite of the masses of men and material put in; they had more than made good the ground lost in 1916, and had captured—apart from enormous booty—90,000 prisoners and 1,200 guns. The British army was heavily shaken; 20 French divisions had been drawn into the battle; but the war had not been won, and neither the transition to a war of movement, nor the separation of the French and British had been achieved. In the course of the battle 90 German divisions—almost half of the western army—had suffered more or less heavy losses. New and great efforts would be required for the fulfilment of Ludendorff's great aim.

Battles of Arras and the Oise.—An attempt was next made to extend the front of the attack on both sides. To this end Rupprecht's group of armies had been preparing since March 22 to carry out the Mars N. attack at an early date, and had allotted to the XVII. Army three divisions standing behind the VI. Army in view of this. To replace them four divisions of the IV. Army were sent to the VI. The group of armies hoped at last to break the British lines by delivering two attacks on their front—this one and the Walkürenritt by the VI. Army—while the II. and XVIII. Armies profited by their early success on the British right wing. But this plan had for the moment to be pushed aside as the Supreme Command placed all the pressure on the left wing of the Michael operation. Not until March 25 did Ludendorff revert to the extension of the attack on the British. He settled that the Mars attack should take place between the Loretto height and the Scarpe on March 28, together with a secondary attack south of that stream. The Walkürenritt attack on the Loretto height was to follow closely.

For this attack 7 German divisions were placed N. of the Scarpe, under the general command of the I. Bavarian Reserve Corps, and 4 S. of it under the general command of the III.

Bavarian and IX. Reserve Corps. But no success was obtained, although the divisions were mainly fresh ones. The work of attacking was hampered by the indistinct nature of the country and the endless maze of trenches. The British opposed the attack with fresh forces, and, particularly by the skillful use of their machine-guns, impeded the advance of the attacking force. North of the Scarpe the 1st line divisions, after some insignificant successes at the start, met with strong British counter-attacks, which threw back the attackers for the most part to their starting positions. Only the two localities, Gravelle and Roeux, remained in German hands. The Command did not put in any reserves.

South of the stream the localities of Neuville and Ayette yielded to the bold assaults of the German divisions fighting in that quarter, but no decisive success was attained. The taking of several thousand prisoners, and heavy losses on the Allied side, were the only positive results of the Mars attack, which had failed for two reasons—it was obviously on too narrow a front and had not been launched as a surprise.

The Supreme Command now gave up the VI. Army attack on the Loretto height, and ordered the XVII. Army, including its right wing, to stand on the defensive.

The extension of the attack S. of the Oise had no such wide operative aims. It was designed in the first place to protect the projecting left flank of the XVIII. Army and the road running behind it through La Fère–Chauny–Nayn, which was indispensable for bringing up drafts. To ensure this the Ailette line, which cut off the reëntering angle between the XVIII. and VII. Armies, had to be won. The task was entrusted to the general commands of the VIII. Army Corps and the VIII. Reserve Corps under the leading of the 7th Higher Army Command. The attack was led from the N.E. in view of the difficult Oise crossing. The attacking force, on April 6, took the French—who were apparently in no great strength—obviously by surprise, and pushed through South Chauny and Amigny to Marizelle and Barisis railway station. On April 7, after a short preliminary bombardment, the attack was continued, and Pierremande and the Coucy Wood were reached with only slight opposition. On the 8th the VIII. Army Corps advanced to the Ailette, S. of Le Bac d'Arblincourt, and stormed Champs. The VIII. Reserve Corps captured Coucy le Château, and reached the road Coucy–Landricourt–Arizy at nightfall. Finally on the 9th the two corps won the Oise–Aisne Canal along the whole front.

In a 4-days' struggle the problem had been smoothly solved. The victors held 2,300 prisoners. The front had been considerably shortened, and the possibility of successful attacks even against French defenders had been established. (W. M.-Lo.)

III. The Battle of Amiens, Aug. 8–22 1918

At the beginning of the fourth week in July, the German offensive on the Marne and in Champagne, which had been intended by their Higher Command as decisive, had been brilliantly repulsed by an Allied counter-blow, which had not only thrown back the enemy over the Marne but was forcing him back to the Vesle. Gen. Foch was resolved to follow up the advantage thus gained and assume the offensive on all his front as soon as possible; but it was essential before so doing to clear the main railway lines running laterally behind his front, several of which were menaced or blocked by the enemy. The most important of these was the Paris–Amiens line, and it was therefore decided that the first measure should be the freeing of this railway by a joint Franco-British attack on a wide front E. of Amiens. This operation was discussed first at a council of the four Allied commanders-in-chief, held at Bombon, near Melun, on July 24 1918 and further in a conference between Gen. Foch and Sir D. Haig on the 26th, and was finally embodied in a directive issued by the Allied Generalissimo on the 28th. It was therein laid down that the offensive should be conducted by the IV. British and I. French Armies, under the command of Field-Marshal Haig; that covered by the Somme, it should be pushed as far as possible in the direction of Roye, and that the road from Amiens to that place should be the dividing line between the two armies. The date fixed, at first Aug. 10, was later advanced to Aug. 8.

Preparation for the British Attack.—An operation similar to that ordered had for some time been contemplated by the IV. Army, and preparations for it were therefore pressed on from July 26 onwards. At this date the army, under Gen. Rawlinson's command consisted of the Australian (Monash) and III. Corps (Butler), (8 infantry divisions and one cavalry division), on the front Albert–Villers-Bretonneux. By the date of the attack it had been reinforced by the Canadian Corps (Currie) (4 infantry divs., another Australian infantry div., and 2 cavalry divs.), while the artillery was brought up to a total of over 2,000 guns, the aircraft to 28 squadrons and the tanks to 456 machines, 96 being whippets. The difficulties of effecting the concentration of these masses of troops and material, while keeping it secret from the enemy, were successfully overcome by means of elaborate precautions surpassing even those taken by the Germans before their spring and summer offensives. The cavalry, whippet tanks and part of the artillery were moved into the IV. Army area by road, the remainder (far the larger proportion) of the troops and material, being brought up in the period Aug. 1–8 in some 300 special trains. It was regarded as of the utmost importance to keep secret the arrival of the Canadians; in order to deceive the enemy, the troops themselves were deceived; Canadian units were sent from Arras into the trenches in Flanders, and the corps was actually brought into line, only a few hours before the attack, relieving the right of the Australian Corps, which had by Aug. 1 taken over the front from the French as far as the Amiens–Roye road. The precautionary measures taken were entirely successful in their object of ensuring that no warning of the attack should reach the enemy.

The front of the IV. Army attack extended from the Ancre S. of Albert to the Amiens–Roye road, a frontage of some 13 m.; three successive objectives were assigned, at distances, respectively of about 2-2½, 3-5, and 6-8 m. from the original starting line, which would bring the army eventually on the line of the "Amiens outer defences," on the front Le Quesnel–Harbonnières–Morcourt. The country, open rolling downland, was favourable for the operations of all arms; the enemy's defences were not formidable. The hostile forces believed to be available to oppose the British, consisted of the LI., XI. and XIV. German Corps (seven divisions in first line and eight in support and reserve) belonging to Gen. v. der Marwitz's II. German Army.

By the morning of Aug. 8 all preparations for the battle had been successfully completed and the British forces were, all unsuspected by the enemy, about to enter on the first stage of their march to the Rhine.

The British Offensive on Aug. 8.—Punctually at 4:20 A.M. on the morning of Aug. 8 the British infantry and tanks, under cover of a powerful barrage, debouched to the assault. Thick ground-mist veiled their advance from the eyes of the Germans, who were completely surprised and in an instant overwhelmed with little resistance. The Canadian Corps sector extended from the Amiens–Roye road to the Amiens–Chaulnes railway; 156 tanks coöperated in the attack of this corps. Opposed to them was the 119th German Div., which was in process of being relieved by the 117th Division. The 3rd Canadian Div. on the right of the line, making light of the difficult task of debouching from a narrow bridgehead on the S. bank of the Luce river, set foot on the plateau between that stream and the Avre, captured Hangard and Démuin, and by noon had carried its front forward to the second objective, between Cayeux and Mezières. Thenceforward the 3rd Cavalry Div. took up the advance, followed by the 4th Canadian Div.; the cavalry, after taking Beaucourt, were held up by machine-gun fire, and though the infantry when they arrived succeeded in pushing forward, it was not found possible to reach Le Quesnel, the final objective, which at fall of night was still strongly held by the enemy. The centre and left Canadian Div., and the 1st and 2nd, attacked each on a front of one brigade, employing a separate brigade for each successive objective; the 1st Div. met with little serious opposition as far as the first objective, which it reached at 6:20 A.M. but the 2nd Div. only attained it an hour and a half later, having had heavy fighting at Marcelcave. At 8:20 A.M. the advance was resumed, and again the 1st Div. had the easier task, the German machine gunners putting up considerable resistance against the 2nd Division. Two brigades of the 1st Cavalry Div. now passed through to the front, and drove far into the hostile territory, capturing Caix, and attaining the final objective, in conjunction with the Canadian infantry, which moved behind them clearing up the ground already passed over by the cavalry. By 5:35 P.M. the Canadian Corps had, with the exception already noted on its extreme right, carried out its appointed task; it had penetrated the enemy's defences to a depth of over 8 m., capturing 12 villages, over 6,000 prisoners and 160 guns.

The Australian Corps advanced between the Amiens–Chaulnes railway and the Somme against the 41st, 13th and parts of the 108th and 43rd German Divs. The Australians had their 2nd and 3rd Divs. in first line and their 5th and 4th in support, the 1st Div. being in reserve N. of the Somme; 168 tanks were attached to the corps. The corps was drawn up by its commander in such a manner as to necessitate a double "leap frogging" of its divisions, while equalizing the exertions demanded of them and the distances to be traversed by them; and this complicated manœuvre was carried out with entire success. The 2nd and 3rd Divs., assisted effectively by the tanks, carried Warfusée and Cérisy, and then relinquished the attack to the 5th and 4th Divs. which pushed forward beyond Baronvillers and Morcourt, despite heavy flanking fire from the German artillery on the N. bank of the Somme. On the second objective being reached at 10:30 A.M. a brigade of the 1st Cavalry Div., with 16 whippet tanks, passed forward to Harbonnières, and an armoured car battalion raced forward down the Amiens–Brie road, scattering death and destruction far to the E. in the enemy's back areas. Behind them the Australians, throwing back their left to face the enemy on the N. bank of the Somme, pushed forward their centre and right to the final objective, just W. of the line Vauvillers–Proyart, where they found the cavalry held up. In the space of under six hours, between this opening of their attack at 6:20 A.M. and the attainment of the above line about midday, the Australian Corps had occupied seven villages, and taken over 8,000 prisoners, 173 guns and much other booty too numerous to mention.

On the N. of the Somme the operations of the III. Corps had not, however, met with the expected measure of success. It had been intended to advance with the 58th, 18th and 12th Divs. to a river from the line W. of Etinehem to W. of Morlancourt, thus securing the left flank of the main attack S. of the Somme; 34 tanks were detailed off to assist this attack. The programme of attack was disarranged by a partial advance of the enemy on Aug. 6 which forced back the 18th Div., and from the first moment difficulties were met with. Sailly Laurette was carried after stiff fighting by the 58th Div. and eventually the first objective was reached along the whole corps front. The further advance of the 58th Div. broke down against the resistance of the enemy holding the Chipilly spur and the 18th Div., which succeeded for a time in gaining ground farther to the N., were counter-attacked and forced to fall back. The enemy on the III. Corps front was not surprised, and fought well, and the attacking infantry were unable to find much support from the tanks, for which the ground was unsuitable in many places; 2,400 prisoners were taken by the III. Corps, together with 40 guns.

The results of what had undoubtedly been the most successful day's battle waged hitherto by the British army in the World War, and one of the finest British victories of all time, were the complete defeat of 11 German by 11 British divs., a gain of ground to an average depth of 6 to 7 m. on a front of 8, and the capture of close on 17,000 prisoners, 373 guns, several thousand machine-guns, and quantities of ammunition and stores. Most important of all, the battle revealed to the enemy Higher Command weaknesses hitherto unsuspected in their army, and destroyed the last hope of German victory. "It was," says Ludendorff, "the black day of the German army in the war. It was the worst experience I had to go through. It marked the decline of our fighting strength and destroyed our hopes of a strategic improvement. To continue would be a gamble. The war would have to be ended."

Operations of I. French Army around Montdidier (Aug. 8–11). The plan of Gen. Fayolle, commanding the French reserve group of armies, involved not only the participation of Gen. Debeney's I. French Army in the British operations N. of Montdidier but a subsequent extension of the attack to the S. of that town by the right wing of that army and eventually as far as the Oise by the French III. Army (Gen. Humbert). Gen. Foch sanctioned this scheme on Aug. 3, and it was decided that the attack S. of Montdidier should take place on the 9th and that of Humbert's army on the 10th.

The French I. Army at this time held a line from the British right flank near Domart to Castel on the Avre and thence along the W. bank of that stream to Courcelles, S.E. of Montdidier, whence the French III. Army continued the line to the Oise. Debeney had under his command the XXXV., X., IX. and XXXI. Corps (in line in that order from right to left) and the II. Cavalry Corps in reserve, in all 12 infantry and 3 cavalry divisions. In face of him stood the 2 left divisions of the German LI. Corps, of von der Marwitz's II. Army, as far as Moreuil, and 7 divisions in line with 2 in reserve, belonging to Von Hutier's XVIII. Army, from Moreuil southwards. The enemy on this front had recently withdrawn his line behind the Avre as a result of several small French operations on the W. bank and was therefore well on the alert.

Debeney's plan for the forthcoming operations consisted first of an advance by his two left corps in the angle between the Luce and the Avre in conjunction with the British right, followed by the passage of the Avre and the Trois Doms and a rapid advance to the plateau around Hangest on both sides of Montdidier by his centre and right, and the capture of that place. The whole army was then to push forward astride the Avre in the direction of Roye.

This programme was carried out without a hitch. The French bombardment commenced at 4:20 A.M. on the 8th, the hour of the British attack, and the infantry and tanks of the XXXI. Corps debouched between the Luce and Moreuil at 5:5 A.M. The German LI. Corps on this part of the front, was, contrary to expectation, taken unawares and put up little resistance; many prisoners were captured while engaged in cutting corn in the fields. Moreuil was taken and the way cleared for the IX. Corps farther S., which about 9 A.M. began to cross the Avre on foot-bridges thrown under cover of darkness early that morning. Here there was stiff fighting, and it was not till late in the day that the tanks were got across the river and cleared the way for the infantry, which at nightfall had reached the line Fresnoy–Plessier. Behind the IX. Corps, the X. was passing the Avre, and preparing for its S.E. advance on the morrow to encircle Montdidier from the N., while the XXXV. Corps was about to execute a similar manœuvre from the south.

The second stage of the operations commenced early next morning, the 9th. In order to secure the left of the X. Corps in its advance on Montdidier the XXXI. Corps attacked Hangest and occupied it about 11 A.M. The X. Corps, passing the Avre and the Trois Doms in its turn, took over the IX. Corps, and, assisted by the latter's artillery as well as its own, pushed forward to the E., meeting with considerable resistance, while the XXXV. Corps, debouching against Assainvillers at 4 P.M., took the enemy by surprise and advancing some 3 m., reached and cut the Montdidier–Roye road near Faverolles. The garrison of Montdidier, their retreat threatened from two sides, fell back hastily under cover of darkness by the road to Guerbigny, leaving behind a rearguard which fell into the hands of the French X. Corps on their entry into the town on the morning of the 10th.

Debeney, urged by Foch in a personal letter "to push forward towards Roye and there join hands with the French III. Army" (which was due to open its attack between Courcelles and the Oise on the 10th), decided, now his army was successfully reunited astride the Avre, to press his advantage in conjunction with the British on his left. The disaster to the German II. Army in the N. had rendered the position of the XVIII. Army, which was facing Debeney, so difficult that it had to throw back its right flank to W. of Roye—a movement which was carried out on the night of the 9th. By the evening of the 10th the I. Army following up the retiring enemy had reached the line Andechy–Bus, and on the next day a further slight advance was made on either wing of the enemy, Lechelle and Tilloloy being taken by the XXXI. and XXXV. Corps.

By now the German XVIII. Army, although its attention was distracted by the advance of the French III. Army against its centre and left, was reconstituting a solid line in the old French zone of 1916. Von Hutier, whose forces had been increased from 15 to 18 divisions by the 11th, established them in depth on two successive lines of trenches, with a strong belt of wire in front, all lines of approach being swept by direct and indirect machine-gun fire. A continuation of the rapid advance of the French I. Army was under these circumstances out of the question, and it was necessary to resort to slower and more thorough measures for overcoming the German resistance which was day by day hardening in proportion as further fresh reinforcements arrived.

Continuation of British Advance (Aug. 9–11).—It was decided by Gen. Rawlinson that the IV. Army should on the 9th continue its advance to the line Roye–Chaulnes–Bray–Dernancourt. The main attack was entrusted to the Canadian Corps which was to push S.E. to the line Roye–Hallu, while the Australian Corps was to secure its left between the latter place and Méricourt, and the III. Corps to advance to Etinehem and form a strong defensive flank on the N. bank of the Somme.

The Canadian attack, on the 9th, failed to attain all its objectives. Assisted by the 2nd Cavalry Div., it none the less effected a deep advance of some 4 to 6 m., secured eight more villages, and halted for the night on the line Arvillers–Rosières. To its left the Australians advanced their front between the Chaulnes railway and the Amiens–Brie road as far as Lihons hill, W. of Lihons village, and Framerville, after stubborn fighting. The III. Corps, reinforced by an American detachment, carried all its objectives for the day, clearing the Chipilly spur and taking Morlancourt. The German II. Army, still much disorganized, had been reinforced by six additional divisions from the XVIII. and IX. Armies, sent up by train and lorry and thrown straight into battle, often without their artillery, and its resistance had noticeably stiffened.

The British advance was continued on the 10th. The Canadians, now opposed by fresh troops from the XVIII. German Army, succeeded in attaining with its left the front assigned to it at Hallu and Fouquescourt but failed to get its right forward to Roye, the western suburbs of which were stoutly held. The Australian Corps which had now extended its left astride the Somme, in order to secure effective coördination of the operations on both its banks, had severe fighting on Lihons hill and was held up by determined German counter-attacks. Operations were undertaken on both banks N. of the Somme under cover of darkness, the plan being to encircle the hostile positions in the Etinehem and Méricourt bends by drawing a cordon across the bases of these bends. Etinehem and all its garrisons were easily taken, but the attack on Méricourt was broken up by hostile bombing planes and had to be completed on the 11th.

The IV. Army orders for this day's operations were that the Canadians and Australians should continue their advance to the line of the Somme and secure the crossings from Offoy (E. of Ham) to Bray. During the 10th and 11th, however, 8 more German divisions had come into line and delivered a series of vigorous counter-attacks which had the effect of putting a stop to any real British advance. The Canadian attacks were cancelled and the Corps had hard work to hold its ground. The Australians captured and held Lihons but could get no farther.

In fact, it was now clear that to push the offensive further would lead to disproportionate loss with little corresponding gain. The German II. Army had reformed its front, shattered on the 8th, with fresh troops drawn from the XVIII. and IX. Armies and from Prince Rupprecht's group in Flanders, and settled itself on the edge of the area devastated in the Somme battles of 1916, where a maze of old trenches, wire, and shell holes rendered defence easy and rapid advance impracticable. The British IV. Army had engaged all its 13 divisions, and its units were tired and in need of a breathing space. Gen. Rawlinson therefore decided on the 11th to allow his troops a few days' rest, while preparing for a renewal of the attack on the 15th. The units in the line were relieved and the tired infantry together with the cavalry were withdrawn into reserve.

French I. Army's Operations (Aug. 12–22).—On Debeney's front also during this period, minor activity took place, resulting in merely local advantages to the French. On the left of the I. Army, the line was drawn closer to Roye on the N.W. and W., while on the right the XXXV. Corps took Reuvraignes on the 20th. In this area, however, the German XVIII. Army had put into line no less than 10 divisions, while on the whole front between Roye and Lassigny a total of over 20 divisions were engaged between Aug. 9 and 22 against the French I. Army. Thanks to the employment of these strong forces, and to the increasing facilities for defence afforded by the shattered and intersected country into which the battle line had now been carried, the German XVIII. Army was enabled to maintain its ground to the W. and S. of Roye until the pressure of events elsewhere compelled its withdrawal in conformity with the armies on either flank at the end of August.

The operations of the French I. Army since Aug. 9 had resulted in the reconquest of an area of ground to a depth of 10–15 m. and the capture of some 12,000 prisoners and over 100 guns, besides much other material and stores.

British Operations (Aug. 12–22).—The IV. Army offensive planned for the 15th did not take place and only partial actions were carried out on its front during the period from the 12th to the 22nd. British attacks alternated with German counter-attacks with no great change resulting in the situation. Thus on the 12th the Australians took Proyart, while on the 15th the Canadians secured Damery and Parvillers. On the 17th Sir D. Haig decided that the next large-scale attack by the British should take place on the I. and III. Army fronts; the Canadian Corps left the IV. Army, the French taking over its sector as far as S. of Lihons and the remainder of the IV. Army line, which on Aug. 22 ran from Damery by Lihons and Proyart to Dernancourt, was left to the 12 divisions of the Australian and III. Corps. Facing them the German II. Army had available 26 divisions, of which, however, only 16 were in good fighting trim.

During the period from Aug. 8 to Aug. 22 the IV. Army had forced back the Germans to a depth of 12 m., had defeated or engaged with its own 13 divisions no less than 27 of the enemy's, had taken from him 23,000 prisoners and 400 guns and had killed and wounded more than an equivalent number of his men at a cost to itself of some 27,000 total casualties.

Offensive of French III. Army (Aug. 10–22).—In accordance with the scheme of Gen. Fayolle, already mentioned, the attack of the French III. Army was launched on the early morning of the 10th. The XXXIV. and XV. Corps (7 divs.), on a front of 14 m., from Courcelles to the Oise, were opposed by 7 German divisions in line and one in reserve, forming the centre and left of the German XVIII. Army. The objective of the French offensive was assigned as the line Lassigny–Noyon. The nature of the ground in front of Humbert's right, a tangled and broken mass of wooded hills, known as the "Petite Suisse," forbade any rapid advance in that quarter, and recourse was had therefore to an enveloping movement by the left (XXXIV.) Corps of the III. Army, which was directed to turn the highland by the north. At 4:20 A.M. on the 10th the attack commenced without artillery preparation; little resistance was met with at first, and before noon a penetration of some 3 to 4 m. had been effected, the infantry reaching the front Onvillers–Macqueglise. The advance was continued during the afternoon against the high ridge of Boulogne, while French aeroplanes carried out a bombing raid on Lassigny, and by nightfall the XXXIV. Corps was on the line Onvillers–Boulogne–La Neuville.

On the 11th the XV. Corps on the right of the army was put into the attack directly against the front of the "Petite Suisse," while the XXXIV. continued to progress to the N. of it. The resistance of the XVIII. German Army, reinforced by an extra division, stiffened appreciably during the day, and all along the line there was hard fighting. Hostile machine gunners ensconced in the broken country made the advance slow and painful; every foot of ground had to be fought for and the French could only advance step by step. After a week's fighting, the "Petite Suisse" still remained partly in German hands, while the French left wing was not yet in possession of Lassigny. The German XVIII. Army which, as already mentioned, had brought back its right flank to Roye on the evening of the 9th and was now also withdrawing its left along the Oise, fought stubbornly to secure time for the evacuation of its artillery and material Nevertheless the French III. Army made daily headway.

It was not, however, till the offensive by the French X. Army on the E. of the Oise threatened by its rapid progress to imperil the retreat of the Germans in the "Petite Suisse" that Humbert's troops could finally force them from their stronghold. On the morning of the 21st the German XVIII. Army fell back all along the line; the French infantry occupied Lassigny and cleared the wooded highland and by the 22nd had reached the line of the Divette, where they were halted to regroup and prepare for a renewed advance.

In the thirteen days' fighting Humbert's 7 divisions had driven from their strong vantage ground 8 enemy divisions and had taken from them 5,000 prisoners and 100 guns.

General Results of the Battle of Amiens.—The course and results of the fortnight's fighting between Aug. 8 and 22 may be summed up as follows:—The three Allied armies engaged (IV. British, I. and III. French), with 32 divisions, had attacked and defeated the II. and XVIII. German Armies, in all 42 divisions. Of these 42 divisions 30 were originally in line or reserve at the moment of the attacks, and 12 were put in from other parts of the front, being drawn from seven different German armies, belonging to three different army groups. The Allies advanced to a depth of between 6 and 14 m. on a front of 47, taking a total of 40,000 prisoners, 600 guns, thousands of machine-guns, quantities of ammunition, *matériel* and stores of all kinds. A wide breach had been made in the German front, susceptible, as events showed, of being rapidly widened to either flank by further Allied attacks. A shattering blow had been dealt to the *moral* of the German army and the German Higher Command, from the effects of which neither was destined to recover. The Battle of Amiens was the first page in the story of the Allied victory of 1918. (X.)

IV. Battle of Bapaume–Péronne, Aug. 21–Sept. 2

The first conception of the battle of Bapaume–Péronne was laid down in a directive from Marshal Foch to Field-Marshal Haig, written on Aug. 10—that is at the moment when the battle of Amiens had just been crowned with a brilliant success, and the enemy was retiring E. along the whole front from the Ancre to the Oise under the pressure of the British IV. and French I. and III. Armies. In this directive it was enjoined that "enterprises of the British III. Army in the general direction of Bapaume and Péronne should be prepared as soon as possible," while "the action of the British IV. Army should be pushed in the direction of Ham." Further instructions for the enlargement of the battle towards the N. to take place simultaneously with its extension to the S. by the advance of the X. French Army between the Oise and the Aisne (timed for Aug. 20), were sent to Haig on the 12 and it was finally decided that the advance of the III. Army should commence on the 21st and be followed by a general offensive on the front of that Army and the IV. Army two days later.

The general scheme of the operations between the Somme and the Scarpe was based, according to Lord Haig, on the following considerations:—

> "The enemy did not seem prepared to meet an attack in this direction and owing to the sucess of the IV. Army, he occupied a salient, the left flank of which was already threatened from the south. A further reason for my decision was that the ground N. of the Ancre river was not greatly damaged by shell fire and was suitable for the use of tanks. A successful attack between Albert and Arras in a S.E. direction would turn the line of the Somme S. of Péronne and gave every promise of producing far-reaching results. It would be a step forward towards the strategic objective St. Quentin–Cambrai. This attack moreover would be rendered easier by the fact that we now held the commanding plateau S. of Arras about Bucquoy and Ablainzeville, which in the days of the old Somme fighting had lain well behind the enemy's lines. In consequence we were here either astride of or to the E. of the intricate systems of trench lines which in 1916, we had no choice but to attack frontally, and enjoyed advantages of observation which at that date had been denied us. It was arranged that on the morning of Aug. 21 a limited attack should be launched N. of the Ancre to gain the general line of the Arras–Albert railway, on which it was correctly assumed that the enemy's main line of resistance was sited. The day of Aug. 22 would then be used to get troops and guns into position on this front and to bring forward the left of the IV. Army between the Somme and the Ancre. The principal attack would then be delivered on Aug. 23 by the III. Army and the divisions of the IV. Army N. of the Somme, the remainder of the IV. Army assisting by pushing forward S. of the river to cover the flank of the main operation. Thereafter if success attended our efforts, the whole of both armies were to press forward with the greatest vigour and exploit to the full any advantage we might have gained."

The line of the British IV. Army at the date of the opening of the new battle on Aug. 21 ran from Fransart by Chilly, Proyart and Dernancourt to Albert. The right of this line as far as the Bray–Corbie road was held by the Australian Corps (Monash) with five divisions (from the right, 4th Canadian, 4th Australian, 32nd, 5th Australian and 3rd Australian) in line and three (1st Canadian, 1st Australian and 2nd Australian) in reserve. To the left of this the III. Corps (47th, 12th and 18th Divs. in line and 58th in reserve) continued the line to the army boundary northward of Albert on a front running along the W. bank of the Ancre as far as Beaucourt and thence W. of Puisieux, Bucquoy and Moyenneville to the Cojeul. The III. Army held the line in order from the S. with the V. Corps (Shute) with the 38th and 21st Divs. in line and the 17th in reserve, from N. of Albert to Beaucourt; the IV. Corps (Harper) with the 42nd, New Zealand and 37th Div. in line and the 5th and 63rd in support, extending as far as opposite Ablainzeville; and the VI. Corps (Haldane) (2nd Guards, 56th and 52nd Divs. in front line, with the 3rd in rear), as far as the army boundary.

Facing these troops the German II. Army (v. Marwitz) held the front opposite the IV. British Army, from N. of Roye to N. of Albert. This army, after its battering on Aug. 8 and succeeding days, held its front with 16 divisions, retaining 7, mostly exhausted and reduced in numbers, in reserve. The XVII. Army (Otto v. Below) was on the right of the II. extending as far as Avion, S. of Lens. On the eve of the attack this army had 11 divisions in first line and 2 in reserve. Both of these armies, together with the IX., to the left of the II., belonged to the newly-formed Army Group of von Boehm, whose area of command thus extended from N. of the Scarpe to the Aisne.

First Stage of III. Army's Advance (Aug. 21–26).—The main attack on the front of the British III. and IV. Armies was timed for Aug. 23 and the two previous days were to be in some sense only a prelude. The operation to be undertaken on Aug. 21 consisted of an advance by the IV. and VI. Corps on a front of 9 m. from opposite Miraumont to Moyenneville, while the left division of the V. Corps secured the right flank of the attack along the Ancre. The general objective was to be the line of the Arras–Albert railway, the attainment of which involved a penetration of the hostile front to a depth of 2 to 3 miles.

The attacking infantry, supported by tanks and covered by a strong barrage, moved forward at 4:55 A.M. The enemy was fully aware of the probability of an offensive on his XVII. Army sector and had adopted his well-tried system of defence in depth, the positions forward of the railway being lightly held by weak forces. These were rapidly driven in along the whole front of attack, their task being rendered difficult both by thick mist and smoke thrown out to cover the advance of the assaulting infantry.

While the 21st Div. of the V. Corps pushed forward along the right bank of the Ancre as far as Beaucourt and set to work to prepare a passage over the flooded and marshy stream at St. Pierre Divion, the 42nd, New Zealand, and 37th Divs. of the IV. Corps carried their first objective, the high ground E. of Bucquoy and Ablainzeville, and then gave place to the 5th and 63rd Divs., which carried the line up to the final objective W. of the railway. Further to the N. the 2nd and Guards Divs. of the VII. Corps, assisted by the 3rd Div., which was leap-frogged over the 2nd for the last stage of the advance, also carried out their allotted task, and though the fog, which had at first favoured the attacking troops caused some little confusion and loss of direction, succeeded not only in reaching but in crossing the railway E. of Courcelles and Moyenneville. Over 2,000 prisoners were captured along the front of attack, of which 1,400 fell to the lot of the IV. Corps.

The German XVII. Army, in view of the loss of its forward positions, requested permission to retake them by a counter-offensive, which was delivered in force on the 22nd, and drove in parts of the new line both in the IV. and VI. Corps sector. It failed however to gain any decided advantage, as the Germans themselves admit, and meanwhile the preparations for the general advance on the whole of the IV. and III. Army fronts on the 23rd were being rapidly completed. At the point of junction of the armies the 38th Div. of the V. Corps, in coöperation with the III. Corps, carried out a series of operations which had as their result the occupation of Albert, and the seizure of points of passage which rendered it possible to throw strong forces to the E. bank of the Ancre in preparation for the morrow.

The main phase of the III. Army's operations began in the morning of Aug. 23, the various formations attacking at different hours along the whole front of 16 m. from Albert to the Cojeul. The enemy resisted with determination, but considerable progress was made all along the line. On the right the V. Corps, still acting in close conjunction with the III. Corps to the S. of it, pushed out its right, the 38th Div., E. and N.E. from Albert and completed its occupation of the hills overlooking the town. By the end of the day this division held a line from just W. of La Boisselle to Aveluy, while its left brigade had thrown parties across the marshes E. of Hamel, where they held on all night in face of repeated German attacks. On the front of the 21st Div., on the left of the V. Corps, only small attacks took place, but the IV. Corps to the N. of the Ancre, commencing its advance at 11 A.M., with the 42nd, New Zealand, 5th and 37th Divs., carried the railway, the enemy's main position, from N. of Miraumont to Achiet le Grand, and pushing forward further on the left, reached a line from Bihucourt to Loupart Wood, whence the front at the end of the day ran sharply westwards N. of Irles and N. and W. of Miraumont. On the VI. Corps the attacking divisions, from right to left were the 2nd, 3rd, Guards, 56th and 52nd. The 3rd Div. opened the advance at 4 A.M. with a successful attack on Gomiécourt, after which at 11 A.M. the 2nd Div. passed through on either side of the village to continue the advance, its objective being the line of the Arras–Bapaume road between Sapignies and Ervillers. The right of the attack made little progress, but on the left Ervillers was taken early in the afternoon. Farther N. the Guards, after seizing Hamelincourt, had also established themselves across the main road, and Boyelles and Boiry Becquerelle also fell into the hands of the VI. Corps before the end of the day, which resulted in the capture of 5,000 prisoners and a number of guns.

In view of the success gained during the day, it was decided to renew the advance at 1 A.M. on the morning of the 24th, the moon being then at the full. This decision was fully justified by the excellent results achieved all along the line. On the V. Corps front, it was projected to carry the strong position on the Thiépval plateau by means of a converging attack from S. and W. by the two wings of the 38th Div. While the right brigade stormed the high ground of La Boisselle and Ovillers, the left brigade, wading across the Ancre at Hamel under cover of its detachments thrown over the previous day, pushed forward as far as Pozières, thus turning the defences of Thiépval from the north. In the afternoon and evening the V. Corps, of which the central and left Divs., the 17th and 21st, had pushed forward through Grandcourt, by dint of heavy fighting, attained the general line W. of Contalmaison–Martinpuich–Courcelette. The IV. Corps had also been highly successful; the 42nd Div. pushed its front by way of Miraumont, where the enemy resisted with unusual stubbornness, to Pys, while the 5th, New Zealand, and 37th Divs., farther N., advanced to the line Grevillers–Avesnes–W. of Behagnies-Mory. The VI. Corps on the left of the army occupied St. Leger and Henin-sur-Cojeul but were held up by a determined defence in front of Croisilles and in St. Martin-sur-Cojeul.

The attack was vigorously pushed on the 25th despite the fact that the troops were becoming weary and the enemy's line heavily reinforced, showed signs of stiffening. The main advance was in the centre; the V. Corps on the right advancing over the old battlefields of 1916 where the ground afforded good facilities for the defence could get on but slowly, and the enemy's prepared fortifications gave him every advantage in the VI. Corps area, where little progress could be achieved. In the centre however, N. of Bapaume, the IV. Corps cleared up the hostile resistance at Sapignies and Behagnies and pushed on in the evening to the line Favreuil–Mory, thus seriously menacing the line of retreat of the defenders of Bapaume.

In fact, at this moment the situation on the front of the XVII. German Army was regarded as "extremely critical." It was believed that the offensive against it was bound to continue and the difficulty of getting up reserves and supplies was enhanced by the lack of communications across the desolated area of the old Somme battlefields. The Army Group of von Boehm was accordingly instructed to retire the line of the XVII. Army to a position already reconnoitred and partly prepared running from Quéant E. of Bapaume and Combles. The withdrawal took place at once in accordance with orders, and was completed by the morning of the 27th under cover of strong rearguards which fiercely contested the advance of the British III. Army.

Conclusion of III. Army's Advance (Aug. 26–Sept. 1).—During the 26th the V. Corps gained the fruit of its hard struggles of the previous days in a deep advance over the Somme battleground, which carried it forward to the western outskirts of what had once been the villages of Longueval, Flers, and Le Sars. The IV. Corps continued to swing round to the N.E. of Bapaume, occupying Beugnâtre, but the garrison of the town still held out. The next few days were taken up with bitter and strenuous fighting along all the front of the army, which grew stiffer as the advancing British drew nearer to the new prepared positions of the enemy. A new British Corps, the XVII. (Ferguson), took over the three left divisions (56th, 52nd and 57th) of the VI. Corps on the evening of Aug. 25, and undertook the hard task of overcoming the German resistance around Croisilles and in the Hindenburg line to the E. Croisilles was not finally secured until the 28th when the enemy garrison, finding its retreat menaced from both flanks, abandoned it early in the morning and from that date for four successive days the XVII. Corps was engaged in to-and-fro fighting in the maze of trenches and dugouts around Bullecourt and Hendecourt which were finally secured by the 52nd and 57th Divs., respectively, on the morning of Sept. 1. The line was established E. of Riencourt by the evening. The part of the XVII. Corps in the brilliant operations of the I. Army against the Drocourt–Quéant line on Sept. 2 does not come within the scope of this narrative.

Further to the S. by the evening of Aug. 29 the Germans, though still holding their ground stubbornly before the VI. Corps, had left Bapaume to the New Zealand Div. of the IV. Corps, and retired before the V. Corps to the eastern edge of the devastated area on the general line Morval–Beaulencourt. Following up their advantage the IV. Corps pressed their advance on Aug. 30 and 31 to beyond Riencourt, Bancourt and Frémicourt, thus rendering it possible for their neighbours on the right and left to resume their progress which had for the moment ceased. While the V. Corps on Sept. 1 drove the enemy from Beaulencourt, Morval and Sailly-Saillisel and on the 2nd from Le Transloy, Rocquigny and Barastre, the VI. Corps finally made itself master of the bitterly contested villages of Ecoust and Vaux Vrancourt and pushed forward to Noreuil. The IV. Corps in the centre, keeping pace with its comrades reached the front Villers au Flos–Beugny on the evening of Sept. 2.

During the 13 days' fighting the 14 divisions of the III. Army had engaged 23 hostile divisions, taken from them 11,000 prisoners, many guns and much material of war, and had driven them back to a depth of from 8 to 13 m. on a front of 20, besides inflicting on them heavy losses in killed and wounded.

IV. Army's Advance to Upper Somme (*Aug. 22–30*).—It has already been stated that the left of the IV. Army N. of the Somme had successfully coöperated in the main advance being carried out by the III. Army on its left during all the period under review from Aug. 22 onward. At the same time, other offensive operations were also carried out by the centre and right of Gen. Rawlinson's line astride and S. of the river, which had the effect towards the end of Aug. of forcing the Germans to retire to the line of the Somme above Péronne.

The attack of the III. Corps, delivered on the morning of Aug. 22, had for its objective the capture of Albert and the crests E. and S.E. of it in order to afford a crossing-place for the V. Corps (the right corps of the III. Army) over the Ancre valley. The 18th, 47th and 12th Divs., as also the 3rd Australian Div., were entrusted with the operation, which involved an advance of some 2,000 to 3,000 yd.; the 58th Div. was held in reserve. Despite the fact that all the precautions taken failed to ensure secrecy and that hostile counter preparations began at 4 A.M., 45 minutes before the attack was timed to commence, considerable progress was made on the whole front. The 18th Div. cleared Albert and joined hands E. of Méaulte with the left of the 12th Div., which together with the 47th on its right, had reached practically all its objectives before noon. The 3rd Australian Div. on the extreme right of the attack had also fulfilled their allotted task as early as 8:30 A.M. But in the afternoon a heavy German counter-attack, put in against the centre of the new British line, recovered much of the lost ground in that quarter, and inflicted such severe losses on the 47th Div. that it had to be relieved during the course of the next day by the 58th Div. from reserve.

This untoward incident somewhat disarranged the army plan for the 23rd, which had originally involved an advance on the whole front from Albert to Chaulnes. It was now decided that only the 18th Div. on the extreme left of the III. Corps should attack in conjunction with the Australians S. of the Somme. Accordingly, on the morning of the 23rd, the 18th Div., acting together with the V. Corps of the III. Army on its left, completed its operations of the previous day by the capture of the ridge immediately E. of Albert. The Australian attack to the S. was more ambitious and equally successful. It was carried out on a front of 4 m. by the 32nd Div. on the right and the 1st Australian on the left and involved an advance of some 2,000 yd. in depth, right up to the edge of the area laid waste in 1916, on the approximate line Herleville–Chuignes–Cappy. The divisions debouched at 4:45 A.M., assisted by 45 tanks and covered by an excellent barrage. The 32nd Div. early seized Herleville and the 1st Australian Div. also successfully carried out the first two stages of its advance, but met with unexpected difficulties in the last phase, which were only overcome after severe and gallant fighting. As a result of the day, 3,000 prisoners and 23 guns remained in the Australian Corps' hands.

Gen. Rawlinson decided, as a result of the day's operations, to go on with the attack N. of the river, and by way of variation to the usual methods an advance was carried out just after midnight of the 23rd by the whole of the III. Corps (47th, 12th and 18th Divs.) and the 3rd Australian Division. With the aid of the brilliant moonlight, good progress was made by all these formations, and despite violent hostile reaction, the ground lost on the 22nd was entirely recovered and La Boiselle, Bécordel and Bray all taken and held. The same good success attended the continuance of the advance next day, Fricourt and Mametz being both seized.

It had by now become evident, in fact, that the German resistance on the IV. Army front, partly owing to the vigorous pressure exercised throughout the last four days, partly owing to the successes of the III. Army farther N., was beginning to weaken, and that only strong rearguards were being encountered fighting to gain time for the retirement of the main body behind the line of the Somme above Péronne. The German Higher Command, as already mentioned, on the 25th, ordered von Boehm (who had about the middle of Aug. been appointed to the command of a new Army Group consisting of the II., XVIII. and XI. Armies, between the Ancre and the Aisne) to fall back to the line of the river Somme–Ham–N.E. of Noyon, and the movement was carried out on the 26th and 27th. During these days the progress of the IV. Army was rapid, being opposed mainly by long range artillery fire and strong machine-gun detachments. By the evening of the 27th the Australian Corps, which had handed over part of its line, as far N. as beyond Lihons, to the French I. Army on the night of the 24th, had reached the front Vermandovillers–Fontaine–Vaux, while the III. Corps which had been severely tested by the resistance of three fresh enemy divisions newly put into line on its front had cleared Trones Wood and Longueval. The German II. Army had now reached its chosen positions of defence between Morval and Pargny but had apparently, at the desire of the Army Group which considered it important to retain the possibility of flanking movement from in front of Péronne against any eventual British advance in the open country to the N., decided to retain its hold on the W. bank of the river in that quarter. Accordingly, the resistance in that area, where the left of the Australian Corps was operating, grew stiffer during the 28th and 29th; while the 32nd Div. on the right of the corps reached the W. bank of the Somme astride the Amiens–Brie road without severe fighting early on the 29th, the 5th and 2nd Australian Divs. only established themselves on the river line after heavy fighting and thanks largely to the coöperation of the 3rd Australian Div. on the N. of the Somme. By the evening of the 30th the Australian line ran along the W. bank from Cizancourt in the S. to Biaches and thence over the river to Clery and was continued by the III. Corps along the western edge of Marrières Wood to Priez Farm and E. of Combles. The Germans in this latter area had also fought stubbornly during the past two days and it became evident that they were here standing on a chosen line of defence. In view, however, of the small prospect of success afforded by any attempt to force the strongly held Somme line above Péronne, the IV. Army Command decided that the next operation must be a strong advance by the centre and left in order to turn that line to the N. and orders to this effect were issued on the evening of the 30th.

Forcing of the Somme Line by IV. Army (*Aug. 30–Sept. 2*).—The plan for the IV. Army's further operations involved the turning of the Somme line, to which the German II. Army had retired, by means of an advance N. of Péronne to the high ground around Nurlu. The III. Corps was to carry out the frontal attack from the W. against the German line northwards from Péronne, while the Australian Corps covered the southern flank of the attack and coöperated in the main operation by pushing forward against Nurlu from the S.W. Before this could be done, however, it was necessary to occupy Péronne and the key to it, the commanding height of Mont St. Quentin. This in itself was a most formidable task, for the position, strong both by nature and by art, dominated all the country to N. and W., and all the river passages by which it could be approached. The German High Command fully realized its importance, and had committed its defence to the picked troops of the 2nd Guard Div. with orders to hold it at all costs.

Sir John Monash, the Australian Corps commander, had already on the 29th formulated his plans for the attack of this stronghold. On this date the line of the corps was held from S. to N. by the 32nd, 5th, 2nd and 3rd Divs., the last-named being N. of the Somme. The idea was to bring over the 5th and 2nd Divs. to the N. bank, for the attack of Péronne and Mont St. Quentin respectively. The seizure of a bridgehead on the N. bank S.E. of Clery, an essential preliminary, was carried out by the 2nd Australian Div. during the course of the 30th, and the bridge at Ommiécourt was ready for use by before dawn on the morrow. On this same night the 32nd Div. on the corps, right extended its front to the N., relieving part of the 5th Div. which in turn took over part of the front of the 2nd Div., thus liberating the necessary forces for the assault.

This was opened at 5 A.M. on the 31st by the 5th Bde., of the 2nd Div. which moved off under cover of a strong barrage and making good progress had attained by 7 A.M. both Feuillaucourt and Mont St. Quentin villages; the right of the brigade however was held up in front of Anvil Wood. To the left of the brigade also the attack of the 3rd Australian Div. had failed to keep pace and a heavy German counter-attack, flung in against the front and left of the troops holding Mont St. Quentin village, compelled them to relinquish it. They rallied again, however, on the western edge and there held their ground till nightfall. Feuillaucourt had also to be abandoned later in the day. Meanwhile the 6th Bde. (also of the 2nd Div.) crossed the river behind the 5th and part of it pushing forward on the right of its comrades, seized Halle and established itself on a line beyond. The remainder halted S.E. of Clery. The 14th Bde. of the 5th Div., also effected a crossing at that place and collected E. of that village, pending the moment when the further advance of the 2nd Div. should allow it to advance against its assigned objective Péronne. By nightfall the 1,200 fighting men of the 5th Bde. had already broken the back of their task. Despite the difficulties which faced them, they had penetrated the formidable hostile positions to a depth of some 2,000 yd., and though reduced in numbers to some 600 rifles had held out on a wide front of 4,000 yd. against reiterated and desperate counter-blows by a foe in every way worthy of their steel. Their single feat of arms was rightly judged one of the finest in the war, and was to receive full fruition on the morrow.

The 6th Bde. of the 2nd Div., assembled S.E. of Clery, was assigned to complete the capture of Mont St. Quentin, passing through the sorely tried 5th Bde., its units already in the front line S.E. of Halle being relieved by the 14th Bde. of the 5th Div., which now undertook the attack on Péronne. While this last-named brigade swept forward through Anvil Wood and Ste. Radegonde, forced its way into Péronne and got possession before noon of practically all the town with the exception of the north-eastern suburbs, the 6th Bde., despite strong opposition from parties of the enemy still at large behind the 5th Bde. front on the Péronne–Bapaume high road, reached the line of that road and after a short preparation by artillery stormed Mont St. Quentin village and wood and established itself on a line from there N. to near Allaines and S. to the E. edge of Péronne. The night of Sept. 1 thus saw the Australian Corps, the 3rd Div. of which on the extreme left had taken possession of the ridges S. of Bouchavesnes, in possession of all its objectives, after completely defeating the enemy opposed to it.

Further to the N. the III. Corps also had done most creditable, if less spectacular work, during these two days of battle. The 58th Div. on the right had cleared Marrières Wood on the 31st, while the 47th Div. made progress towards Rancourt, repulsing a hostile counter-attack. On the morrow these successes were continued and completed by the capture of Rancourt and Bouchavesnes, while the 18th Div. on the left of the corps in a brilliant series of attacks seized in turn Priez farm, Frégicourt and Saillisel, inflicting serious losses on the enemy, who afforded a stubborn resistance.

Sept. 2 saw the completion of the successful operations of the IV. Army in the battle of Péronne, the Australian Corps occupying Allaines and the III. Corps St. Pierre Vaast and Vaux woods. The results of the battle were imposing enough even in mere figures. In the period between Aug. 22 and Sept. 2 the IV. Army's 9 divs. had engaged and defeated 23 hostile divs. and taken from them over 23,000 prisoners, many guns and vast quantities of material. The strong line of the Somme had been turned and rendered untenable by sheer hard fighting in which the attacking troops had shown themselves capable of meeting and defeating the best of the German divisions which, thrown in piecemeal and in the utmost haste and confusion as they arrived on the field, had been unable to hold for long even the strongest natural and artificial defences.

General Results of the Battle of Bapaume–Péronne.—In the battle described above the British III. and IV. Armies, consisting of five corps (23 divs.) in all, had fought and defeated the German XVII. and II. Armies, consisting of five corps (46 divs.), had forced them to fall back to a depth of from 6 to 13 m. on a front of 28, and had captured from them a total of 34,250 prisoners and 270 guns, without reckoning other material of war too various to recapitulate. The whole area of the Somme battlefields, which had cost the British five months' bitter fighting in 1916, had been conquered in less than a fortnight; more than half the area gained by the great German advance of the spring had been recovered; the only good natural line of defence available for the enemy to the W. of the Hindenburg system had been broken asunder; and the moral and material superiority of the British over the German fighting machine had become patent to the world. (X.)

SONNINO, SIDNEY, Baron (1847–), Italian statesman (*see* 25.416). During the debates on Giolitti's Steamship Subsidies bill in the spring of 1909 it was Baron Sonnino who conducted the most vigorous attacks against the Government, exposing the radical defects of the measure, and when Giolitti resigned on Dec. 2 it was Sonnino who was called upon to form a ministry, for the second time. But he did not enjoy the favour of the still Giolittian Chamber, and his Cabinet was defeated over the new shipping bill. On March 21 1910 he resigned, again after 100 days of office. He continued to take an active part in the debates in the Chamber, and was a stern but just critic of Giolittian political methods, although during the Libyan war he generally abstained from opposition for patriotic motives. In the autumn of 1914, after the death of the Marquis di San Giuliano, the Premier Salandra assumed the Foreign Office for a short time, but when he reconstituted his Cabinet on Nov. 5 he offered that portfolio to Sonnino, who accepted it. His conduct of the Foreign Office was characterized by sincerity of purpose, high principles, unswerving patriotism and a wide knowledge of international politics. He had not, moreover, a free hand. He was still Foreign Minister, under Orlando's premiership, during the Peace Conference, which he attended as second Italian delegate from Jan. 18 to June 19 1919. On the fall, however, of the Orlando Cabinet (June 19 1919) Sonnino retired into private life. The irritation of the whole of Italy against the policy of the Allies towards Italy at the Peace Conference reacted to some extent against the nation's representatives at Paris, and Sonnino himself came in for a large share of unpopularity, although the more intelligent and better informed part of public opinion realized the great difficulty of his task and the insufficient support afforded him by Orlando, as well as the value of his actual achievements. He did not stand for Parliament at the elections in Nov. 1919, but was subsequently made a senator. In spite of what was regarded as his failure to overcome the obstacles of the Peace Conference, he enjoyed the reputation of being the greatest Minister for Foreign Affairs that Italy had had since Cavour, with the possible exception of Crispi, while as a financier he ranked very high. He was also a man of wide reading and culture, and a distinguished Dante scholar and bibliophile.

SOROLLA Y BASTIDA, JOAQUIN (1863–), Spanish painter (*see* 25.434), was engaged for practically the whole of the decade 1910–20 on work for the Hispanic Society of America. It includes a series of portraits of Spanish writers, and a "Panorama of the Forty-nine Provinces of Spain" consisting of forty-nine immense compositions, each representing views, costumes and customs of a different province. This great undertaking was completed before paralysis brought the artist's painting to an end. Important exhibitions of his work were held at the Grafton Galleries, London, 1908; in New York, 1909; in Chicago, 1913; and he was represented by two typical works in the 1920–1 Exhibition of Spanish Paintings at Burlington House.

See Hispanic Society of America, *Eight Essays on Joaquin Sorolla y Bastida*, 1909; A. de Beruete y Moret, *Sorolla y Bastida*, 1920.

SOUND (*see* 25.437).—The increase in our knowledge of the subject of acoustics (the science of Sound) during recent years has been largely associated with the war conditions which prevailed from 1914 to 1918. As a consequence of the war the development of this science has been abnormal,[1] and research has been directed towards the rapid realization of practical acoustic devices and methods for immediate use in warfare, both on land and sea. A general survey of the work done shows that the advances consist of applications of well-established principles, rather than the discovery of new phenomena. Generally, the observations made have proved to be in accordance with previous theoretical investigations, mainly due to the late Lord Rayleigh.[2] This war work falls naturally under two headings, viz. (1) the detection and perception of direction of sounds in air, and (2) the detection and perception of direction of sounds in water. Theoretically, these two problems have much in common, but, practically, there are important differences which make it desirable to treat them in separate sections. A special section (3) is devoted to the important advances recently made in auditorium acoustics, and the remaining section (4) deals briefly with miscellaneous outstanding features of modern work on sound, not essentially military in character.

1. DETECTION AND PERCEPTION OF DIRECTION OF SOUNDS IN AIR[3]

Detection.—The human ear itself is a remarkably sensitive detector of the air vibrations which constitute sound. It is still much superior in this respect to any mechanical device which has yet been produced for recording the vibrations visually. Thus the perception of feeble sounds of necessity depends upon the limitations of audibility, either indirect listening, or with the ear aided by the intervention of an electrical device such as a microphone. The audibility of a feeble sound can be very largely augmented by making use of the principle of resonance, provided that the sound itself approximates to a pure tone. This can be secured, for example, by the use of a Helmholtz resonator applied to the ear in the case of direct listening, and in addition, by tuning the diaphragm receiver when microphonic listening is adopted. It has happened fortuitously that one of the chief sounds in air which it is important to be able to detect, viz. those emitted by aircraft, do contain predominant notes which enable the application of resonance, as above indicated, to increase largely the range of audibility. Typical predominant frequencies (apparently due to engine exhaust) are given in the following table, which relates to the engine running at the usual speed:—

Aeroplane engine	Frequency (vibrations per second)
S. E. 5	130
R. E. 8	90
F. E. 2B	70
Avro	90
Gotha	80

The following frequencies have been detected in the sounds from the Maybach engines of a Zeppelin airship:—

Slow speed—27, 54, 108, 135, 243.
High speed—57, 114, 171, 228.

The operation of the *Doppler effect*, arising from the relative motion between the aircraft and the observer, prevents the possibility of the identification of the machine by means of the observed frequency, this being liable to change by as much as 20%, according to the speed and direction of flight. An interesting observation which has been constantly made is that the notes of low pitch continue to be heard at ranges where those of high pitch have ceased to be audible. This is in accordance with the theoretical expectation that damping increases with frequency.

The determination of the direction whence a sound arrives is theoretically possible by a variety of methods dealt with below, several of which have been tried in aircraft localization.

(*a*) *Binaural Listening.*[4]—Lord Rayleigh's experiments (*Collected Papers*, vol. 5, p. 347) have shown that low-pitched sounds are determined in direction by the observation of the phase difference between the vibrations arriving at the two ears. This principle has been applied in direction-finding, and the effect has been exaggerated by increasing the distance between the two points of reception. The sound is received by two equal trumpets or horns rigidly connected together and capable of rotation about an axis perpendicular to the line joining them. Separate and exactly equal tubes lead from the trumpets to the two ears, respectively, and the apparatus is rotated until the sound under observation appears to come from directly in front. The line joining the sound receivers is then perpendicular to the incident sound stream. An alternative method which dispenses with the necessity of rotating the apparatus is to use a *compensator* or *phase-measurer*, which consists of tubes, adjustable in length, inserted between the sound receivers and the appropriate ears, so as to provide a path difference equal to that between the distant source of sound and the two receivers. Adjustment of the tube lengths is made until the impression received is that the sound is neither to the right nor to the left, and the determination of direction is then a matter of simple geometry. In practice the compensator is graduated to give direct angular readings.

The practice of binaural listening has verified theoretical conclusions in several important respects. It has been found that it is easier to perceive the direction of a mixed sound, or noise, than a pure note. Apparently it is necessary that the wave train should contain more or less isolated special characteristics whereby the phase difference can be readily appreciated. In the regular sine wave corresponding to a pure tone each vibration is exactly like those which immediately precede and follow it, and the ears are unable to identify corresponding displacements. It is apparently also necessary for successful binaural listening that the two portions of the incident wave which enter the two receivers should be free from subsequent distortion; in particular, that the sound receivers should be as nearly as possible non-resonant for the vibrations in question. Any amplification of the sound which depends upon resonance, therefore, such as the use of Helmholtz resonators already referred to, is incompatible with efficient direction-finding by observations of phase difference.

The construction and arrangement of the receivers used has varied very much in practice. As a typical system, that commonly used in the British army may be quoted, namely, circular cones, 2 to 4 ft. long and of semi-angle 20°, as receivers, placed about 7 ft. apart—a distance which proved to be sufficient for attaining nearly the maximum practical accuracy of setting.

The method is subject to many errors, chiefly those arising from the motion of the sound source, refraction due to temperature inequalities in the air, and the effect of winds. The necessary corrections are tabulated for use in practice.

(*b*) *Sound Mirrors.*—Some success has been attained in direction-finding by means of concave sound reflectors. The chief limitations have arisen from the question of size, and, consequently, of portability. In optics the size of mirrors commonly in use is very great in comparison with the wave-lengths of the light; in the corresponding problem in acoustics it is almost impossible to make them so; and yet this is a necessary condition for the geometrical laws of reflection to apply with accuracy. In the largest sound mirrors—perhaps 20 ft. in diameter—the size is at most only a few wave-lengths for the aircraft sounds under investigation, with the result that the image of a distant sound obtained at the focus proves to be an area much larger than that corresponding to optical calculations. There is therefore no advantage secured by making the mirror paraboloidal instead of spherical, and considerable roughness of the surface is not detrimental. The mirrors were usually made of concrete, and listening was effected either by means of a small horn receiver placed in the focal plane and connected by a tube to the ears, or by means of a microphone placed in a similar position. If, as was more usual, the mirror was fixed, the direction of the sound source could be found by determining the position of maximum intensity in the focal plane. It may be noted that in this method of direction-finding amplification is obtained on account of the area of the mirror, and that further augmentation is attainable by using resonators, to which the same objections do not apply as in binaural listening. The accuracy of the determinations vary very much with frequency, being much greater for notes of high pitch than for low, as would be anticipated from considerations of wave-length.

---

[1] Owing to the abnormality of the conditions, it is impossible to follow the usual practices in writing the present article. Experiments on sound, with military ends in view, have been carried out in nearly all the belligerent countries. Comparatively few of the results have found their way into the recognized scientific journals, largely by reason of the secrecy which is still frequently enforced by the various Governments, under whose control most of the work was done. In the circumstances it is not safe to attempt to assign credit to particular investigators, nor is it possible to give adequate references. The present article has been drawn up, therefore, upon broad general lines which, since they fulfil censorship conditions, form necessarily a by no means complete survey; and names have been avoided as far as possible.

[2] Lord Rayleigh's work is contained in his *Collected Papers* (No. 6, 1920). His contributions were numerous between 1911 and 1919, when he died.

[3] The information contained in this section is largely drawn from a manual entitled *Development of Sounds*, kindly placed at the writer's disposal by the British Munitions Inventions Dept.

[4] This method of perception of direction has been largely used also in a connexion which scarcely justifies treatment in a separate section. The *geophone* is an instrument for direction-finding of sounds proceeding through the earth, and its particular use during the war was for localizing the sounds of picks, etc. used in tunnelling and land mining. It consists of two hollow boxes connected by equal tubes to a stethoscope arranged so that the sounds proceed from the two boxes to separate ears. The boxes are laid upon the ground a few feet apart, and moved about until the sounds of the pick appear to come from straight ahead. It is then known that the sound source is on a line perpendicular to that joining the two geophone receivers, since the sounds arrive through the earth in synchronism. By combining several pairs of geophones separated by considerable distances, the actual position of the pick can be estimated, for it lies at the intersection of the several perpendiculars above specified.

(c) *Interference and Diffraction Methods.*—There have been many attempts to apply the principle of interference as a substitute for binaural listening, *i.e.*, by ultimately mixing the sounds entering the two receivers, instead of leading them to different ears, and adjusting the compensator until the total sound heard is as loud as possible. Theoretically this will occur when there has been provided in the compensator a difference of path equal to the path difference outside the receivers. The method has not proved very successful, for a variety of reasons, some of which are obscure. We shall not elaborate them here.

On the other hand, remarkable results have been obtained by the application to sound waves of a phenomenon well known in the *diffraction* of light. A small distant source of light gives in the middle of the shadow of a small circular obstacle a luminous region, called the "white spot," arising from the diffraction of light round the edges of the obstacle. The same phenomenon is observable in sound under suitable conditions. Thus a large horizontal disc, at least 20 ft. in diameter, and made of material which either reflects or absorbs sound, will give below itself a sound shadow of a sound source, such as an aeroplane, above it. Near the centre of the shadow, in a position depending on that of the source, there is a region where the sound heard is comparatively loud—in many cases much louder than it would be if the disc were absent. The relation between the direction of incidence of the sound and the position of maximum intensity has been calculated, and the method provides, perhaps, the most reliable means of perceiving the direction of air-borne sounds.

(d) *Sound Ranging.*—This special military aspect of the localization of sound sources, viz. those arising from gun-fire and shell bursts, is dealt with in the article RANGE-FINDERS.

2. DETECTION AND PERCEPTION OF DIRECTION OF SOUNDS IN WATER[1]

Of all the methods practised for the detection of submarines that depending on the sounds which they emit has been of the widest application. The question of detection has been, of course, of nearly equal importance in the opposite sense, viz. the hearing of surface ships by the crew of a submerged submarine. The sounds created in the sea by a screw-propelled ship are of a very complicated character, arising partly from the interaction between the propeller and the water, and partly from the vibrations of the machinery which are transmitted through the walls of the ship into the sea. They vary greatly from ship to ship, even of the same class; and, in the later stages of the war, submarines had been constructed which, when cruising submerged at certain slow speeds, emitted practically no noise at all. In many ways the detection of submarines in the sea is more difficult than that of aircraft in air. Normally, listening in air takes place at stations which are fixed; in submarine listening the stations were most frequently ships, which for tactical reasons connected with their safety, had to be constantly on the move. Their own machinery noise and the acoustic disturbances arising from their motion through the water were very apt to drown the noises proceeding from more distant sources. The noise of the sea, too, even in weather not at all stormy, interfered greatly, and the range at which a submarine could be heard varied much from day to day. A serious additional limitation was that recourse could not normally be had to the reflection of ordinary sounds (as is possible in air) chiefly by reason of the great size of the necessary reflectors. For the speed of sound in sea water is more than four times that in air, so that the wave-lengths are larger in the same ratio. This necessitates a corresponding increase in the linear dimensions of the sound mirror, if equal efficiency is to be obtained.

Hydrophones.—Hydrophones, or under-water sound detectors, were already in use before the war for signalling purposes, being carried by ships for listening to submarine bells operated by Trinity House as warnings in foggy weather. They consisted of small, metal, water-tight cases of which one face was a metallic diaphragm operating an enclosed microphone. The electrical disturbances of the microphone caused by any vibration of the diaphragm arising from sound pressure waves in the sea, were conveyed to telephone receivers on the ship, where listening took place. It was usual to suspend the hydrophones in water-filled tanks attached inboard to the outer shell of the ship, which, owing to the fact that steel in water transmits sound almost completely, does not diminish appreciably the intensity. Normally the hydrophone diaphragm was tuned so that its natural frequency in water[2] approximated to that of the signalling bell, and so that increased range could be secured by depending on resonance.

The earlier hydrophones used for naval purposes were of much the same type, although the resonant diaphragm proved to be by no means an unmixed advantage. All sounds containing a component corresponding to the diaphragm frequency were distorted in reproduction, and what was gained in sensitivity was liable to be lost in the difficulty of recognition, or, in other words, failure in discrimination between genuine noises due to a submarine and other noises inevitably present in the sea. Appeal to resonance is only really advantageous when the sound under observation has a predominant note, as in the case of an aeroplane; and submarines do not display this characteristic. Ultimately hydrophones of a non-resonant character came to be preferred, and were frequently used in practice. These consisted most usually of enclosures made of rubber, sufficiently thick to withstand the pressure of the sea at the usual depth (about 15 ft.), and having natural frequencies *below* the limit of audition.

An alternative type of hydrophone consisted merely of a hollow enclosure without a microphone, sometimes with a metallic diaphragm, and sometimes simply a rubber tube, filled with air and connected by long tubes to stethoscopes applied to the ears. These are operated by the transference of the pressure vibrations from the sea to the air cavity and thence to the ears. Electrical hydrophones have the advantage over non-electrical ones that their sensitivity can be readily augmented by various means, *e.g.*, bv the use of thermionic amplifiers (*see* WIRELESS TELEGRAPHY).

In cases where the hydrophones had to be used by ships in motion, they were sometimes fitted into the hull of the ship; or themselves consisted of fish-shaped bodies towed at a considerable distance behind the ship. The former precaution, *i.e.* making the shape stream-like, aimed at diminishing the vibrations created by the passage of the hydrophone through the water; the latter had in view the partial elimination of the disturbances arising from noises in the towing ship. Even so, it frequently became necessary to stop the engines temporarily, and listen with the towed hydrophones while the momentum of the ship continued to carry it forward. This proved to be only feasible at comparatively slow speeds.

Directional Hydrophones.—All the hydrophones so far described are of a non-directional character, *i.e.* the intensity of the sound heard in them is practically independent of the orientation of the sensitive receiving diaphragm with respect to the position of the source of sound. The limitations of dimensions necessitated by considerations of portability, etc., are such as to render the instruments much too small to give an effective "sound shadow." The reason for this has already been mentioned, viz. the great wave-lengths corresponding to audible sounds. At a frequency of 500 per second, for example, the wave-length in water is nearly ten feet.

Differential Hydrophones.—Curiously enough, however, one type of directional hydrophone, called here for distinguishing purposes a *differential* hydrophone, did, in fact, depend upon the small differences of pressure operating upon its two sides; and it met with considerable success. It was made in various forms, the simplest of which consisted of a circular metal diaphragm, bearing at its centre a water-tight box containing a microphone, and clamped round its rim to a heavy metal ring. When placed in the sea so that the plane of the diaphragm passed through the position of the sound source, the pressure variations on the two sides are the same both in amplitude and phase, with the result that the diaphragm and therefore the microphone, has no motion imparted to it, and the sound heard is a minimum. If, however, the diaphragm faces the sound source, there are, apparently, differences in the pressures on the two sides (probably in both amplitude and phase), and a small differential vibration takes place, with consequent sound in the receiving telephones. Actually, as the hydrophone is rotated through 360° about a vertical axis, two maxima and two minima of sound intensity are observed. In this form, therefore, the instrument is what is called *bi-directional*, *i.e.* it is unable to distinguish between sources in *front* and *behind*. The desirability of obtaining a *uni-directional* instrument led to the introduction of the so-called *baffle-plate*, the behaviour of which has not yet been explained satisfactorily in terms of orthodox theory. The essential characteristics of a baffle appear to be that it should be made of non-resonant material and have air cavities within it. Such a plate, fixed at a small distance (which has to be determined by trial) from one face of a bi-directional hydrophone, transforms it into a uni-directional instrument. A single sound maximum is now obtained upon rotation, occurring when the sound source and the baffle plate are on opposite sides of the diaphragm; and a single minimum,—this when the baffle lies between the sound source and the diaphragm. The "edge-on" minima, observed when the baffle is absent, now disappear.

---

[1] The following publications should be consulted, although, for reasons already given, they form by no means adequate references:—H. C. Hayes, *Engineer* (1920), p. 491; C. V. Drysdale (Kelvin Lecture), *Journ. I.E.E.* (1920); W. H. Bragg, "Submarine Acoustics," *Nature*, July 1919; F. L. Hopwood, "Submarine Acoustics," *Nature*, Aug. 1919.

[2] This is considerably lower than the natural frequency in air, on account of the additional loading by the water.

Binaural Listening.—The principles underlying this method of direction-finding have been described already. In the present case the main difference is that the sound receivers have to be submerged hydrophones. It has been found to be equally necessary for success that these should be as completely as possible non-resonant. The simplest arrangement used in practice was two rubber cavities placed several feet apart horizontally, and joined by separate equal tubes to the two ears. The device could be rotated about a vertical axis, usually passing through the hull of the operating ship. As in the case of air listening, compensators were often used in order to avoid the necessity of rotating heavy apparatus. An arrangement much preferred was to tow two or more fish-shaped hydrophones in known positions (about 12 ft. apart) behind the ship. Here electrical transference of the acoustic disturbances had to be adopted, and this necessitated great care in the choice of the microphones and telephone receivers so as to avoid selective resonance. (The behaviour of microphones in this respect was often unsatisfactory, and telephone earpieces, or magnetophones, were frequently substituted for them. This results in diminished sensitivity, but the binaural effects are much improved.) The telephone receivers delivered the sound into the compensator, and the phase difference was measured in the usual way; allowing, of course, for the difference of speed of sound in the sea and in the air channels of the compensator. In using a compensator with two sound-receiving units only, there remains an ambiguity of estimated direction, *i.e.* one cannot distinguish between the angles θ and $\pi+\theta$. The introduction of a third unit, so that the three form a triangle of known dimensions,—the units being capable of use in pairs with the compensator—ensures the correct choice between the alternative angles.

Other Methods of Direction-finding.—Several other methods of perception of direction, not easy to classify, have found application in practice. One of these consisted in fitting in the shell of a ship, on opposite sides, two diaphragms with microphones attached, arranged so that the hydrophones thus formed were of as nearly as possible equal sensitivity. These were listened to alternately by means of a reversing switch. The ship, on account of its considerable size, was capable of giving a marked sound shadow. Thus the starboard hydrophone would give greater response than that on the port side if the sound source were to starboard, and vice versa. By steering the ship so that the responses were equal, it could be inferred that the course was directed towards the cause of the sound. The limitations of the method were mainly those arising from local noises; and the speed had to be small while listening took place.

In other cases large numbers of sound receivers, usually simple diaphragms whose function was to transfer the vibrations from the sea to the air inside, were inserted in the ship's hull. Good results were obtained by an arrangement of this kind, called the Walser gear, in which the sound receivers were disposed at regular intervals on a large bulge, in the shape of a spherical segment, incorporated in the hull on either side towards the bows. The system acted as a sound lens, a sound focus occurring at a point where the "sound paths" by alternative routes were equal. Application of the laws of geometrical optics enabled the relation between the position of the focus and the direction of incidence of the sound wave on the ship's side to be determined.

Sea Sound-Ranging.—The methods hitherto mentioned for perceiving sound direction would all fail when the sounds are abrupt in character, because they all require an appreciable time for carrying out the necessary tests. To determine the position of an exploding submarine mine or torpedo we require, therefore, a different device. A suitable method is one identical in principle with that practised on land. The main variations in applying the device to the sea are that the microphones must be in submerged hydrophones, and that a correct knowledge of the velocity of sound in sea water must form the basis of the calculations. Ordinary non-directional hydrophones of the type first mentioned have proved to be quite sufficiently sensitive. Indeed, the greatness of the distances at which explosions in the sea have given unmistakable impressions on the recording film has been surprising. Small detonators serve at distances of several miles, while the explosion of 40 lb. of gun-cotton is operative more than 100 m. from the receiving hydrophones. Many experiments have been carried out by the British Admiralty with hydrophones disposed in suitable positions on the East coast of Britain, and the installations promise to be useful, not only for locating mine and torpedo explosions in circumstances of war, but also for navigational and surveying purposes. A ship in fog, for example, could ascertain its position by exploding (with due notification by wireless to the sound-ranging station) a small charge near itself in the sea; the station could within a few minutes inform the ship—again by wireless—of its position.

Sea sound-ranging has necessitated the accurate redetermination of the velocity of sound in sea water. This has been accomplished by the inverse of the process just mentioned, viz. by exploding charges in the sea, and measuring by the recording string galvanometer the time intervals between the reception of the first shock by hydrophones submerged in accurately known positions. The observed velocity depends on several factors, including tidal flow, temperature, and salinity, which vary from place to place. The following table gives some of the results obtained, corrected to a standard salinity corresponding to a specific gravity of 1·026 and a temperature of 10° C.:—

Date	Place	Corrected Velocity in ft. per sec.
16· 5· 18· .	Dover	4,882
6· 11· 18· .	"	4,921
18· 7· 18· .	"	4,924
26· 7· 17· .	Culver (I. of W.)	4,962

The effect of tide, apparently, has not been allowed for. It would amount, at most, to a few feet per second.

3. AUDITORIUM ACOUSTICS

The acoustics of public buildings have recently been put on what approximates to an exact scientific basis, largely as a result of the work of W. C. Sabine (*Frank. Inst. J.*, 179, p. 1, 1915). For good hearing three conditions are necessary and sufficient. The sound heard must be *loud enough;* the simultaneous constituents of a mixed sound must preserve their *relative intensities;* and the successive sounds must *remain distinct and in the correct order*, and be free from extraneous noises. The extent to which these conditions are fulfilled depends on the construction of the auditorium, its shape, its dimensions, and the materials of which it is composed. In already finished buildings radical alterations of the first two are not often feasible, but great improvements can be secured solely by suitable changes in the internal features.

The main difficulty arises from what has been called *reverberation*, due to the multiple reflection of sound at different parts of the room. If the reverberation is prolonged, it means that the rate of absorption of the sound is slow. Thus, in a lecture room at Harvard, where these experiments were commenced, the rate of absorption was so small that a single spoken word continued to be audible for 5½ seconds. Successive syllables thus had to be heard and appreciated through a loud mixed sound due to the reverberation of many previous syllables, and the conditions of hearing were intolerable. Great reduction of the multiple echoes constituting reverberation can be made by increasing the rate of absorption of sound. It is apparent that, in the space of several seconds, the sounds travelling at 1,100 ft. per sec. will have suffered many successive reflections, and will, therefore, have penetrated to practically all parts of the room. The sound will have become diffuse radiation, and absorbing material introduced almost anywhere will be equally effective in reducing reverberation. An open window proves to be a complete absorber, in the sense that it permits the egress of the maximum possible quantity of sound radiation (*cf.* the properties of a small aperture in an isothermal enclosure in heat radiation). The introduction of cushions, carpets, wall hangings and people also largely diminishes reverberation, because of their considerable absorbing powers. Sabine has made a systematic study of the coefficients of sound absorption of various materials by the inverse method of measuring their effect in reducing the duration of reverberation. Typical results are given in the following table. These apply to the frequency an octave above middle C.

Material	Coefficient of Absorption
Open window	1·000
Linoleum, loose on floor	0·12
Oriental rugs	0·29
Plaster on wood lath	0·034
Glass, single thickness	0·027
Plain ash chairs	0·008
Upholstered chairs	0·30
Hair felt, 2·5 cm. thick, 8 cm. from wall	0·78

Other measurements indicated that an audience gave an absorption equal to 44% of that due to an equal area of complete absorber, thus accounting for the improved hearing conditions known to exist in well-filled buildings.

The absorption of sound can thus be adjusted with precision, but it must not be carried too far, otherwise the *sound intensity* is too much diminished. The ear is able to disregard, or even to take advantage of, reverberation which is not too prolonged, and the extent of absorption has to be adjusted to the appropriate amount. Too many apertures such as open windows or doors must be avoided.

Sabine has also made examination of the exact manner in which sound is reflected in an auditorium by constructing scale models of the latter, and photographing the sound waves at various instants after creation, using the beautiful method due to Toepler (*Annalen der Physik*, 127, p. 556) and elaborated by R. W. Wood (*Physical Optics*, 2 ed., 1911, p. 94). By this means the positions of the sound waves, both incident and reflected, are capable of observation at all instants and at all points in the model room, and they provide data upon which can be based correct architectural construction from the acoustic point of view.

4. Miscellaneous Advances

Absolute Measurement of Sound.—A. G. Webster (*Nat. Acad. Sci. Proc.*, 5, p. 173, 1919) has advanced to a considerable extent the methods of absolute measurement. For this purpose it is impossible to rely upon audition, handicapped as it is by the vagaries of the ear. What is required is a reliable mechanical device, the performance of which is constant, to record the sound vibrations with sufficient magnification. Webster has made an exhaustive study of the properties of various materials, and has constructed from those most suitable for the purpose two instruments which he has called the *phone* and *phonometer* respectively. The phone provides a means of creating a simple tone of intensity and frequency which are under control and capable of exact measurement. The phonometer is an instrument for measuring absolutely the vibrations received by it. It consists of the combination of a diaphragm and a resonator, both of which are adjustable in frequency. The motion of the diaphragm is observed by making it a reflector and part of a Michelson interferometer, so that the amplitude is measured in terms of the wave-length of suitable monochromatic light. In practice the interference fringes are photographed on a moving film upon which they appear as wavy lines. Against this instrument, which is regarded as a standard, other portable phonometers can be calibrated, these depending on the simpler process of the deflection of a beam of light set into angular oscillation by the receiving diaphragm. With such instruments, and also with D. C. Miller's *phonodeik* (referred to later) L. V. King has carried out an elaborate investigation on the propagation of sound in air and fog-signal efficiency (*Phil. Trans.*, 218, p. 211, 1919) in the region near Father Point, Quebec. King, in this paper, also describes a modification of the siren called the *diaphone*, used as a standard source of sound in his research.

Analysis of Sound.—Webster's phonometer described above is a resonant instrument, and, therefore, unsuitable for the analysis of mixed sounds. Much progress has been made, however, in the analysis of such sounds, using non-resonant recorders, for example, D. C. Miller's *phonodeik*. This instrument, which depends on the motion imparted to a tiny mirror by the operation of a vibrating diaphragm, is described in Miller's *Science of Musical Sounds* (1916), where also will be found the results of the analysis of various sounds. Similar work has been carried out by C. V. Raman, in relation to the vibrations of bowed strings and instruments of the violin family (*Indian Assoc. for Cultivation of Science*, Bull. No. 15, 1918). In these cases the sound record is of the ordinary type and consists of the trace on a moving photographic film of a spot of light vibrating at right angles to the motion of the film, thus forming a transverse wave. Records of a different type have recently been obtained (A. O. Rankine, *Proc. Phys. Soc. Lond.*, 32, p. 78, 1919) in which the sounds are caused to vary the *intensity* of a narrow beam of light, which gives on a moving film a line image perpendicular to the motion. The record thus consists of a negative film of varying transparency along its length. It is not so suitable as transverse records for direct analysis of the component frequencies, but it has the advantage that it admits of *reproduction* of the sound by means of a selenium cell, such as is used in photo-telephony. This arrangement constitutes a novel type of phonograph operated by light, first invented by Ernst Ruhmer in 1900, but hitherto little known. (A. O. R.)

SOUTH AFRICA (*see* 25.463).—On the conquest of German S.W. Africa by the Union forces in 1915 the whole of S. Africa, except for the Portuguese possessions S. of the Zambezi came under British administration. Excluding the Portuguese territory (for which *see* Delagoa Bay and Portuguese East Africa), S. Africa was in 1921 divided politically as follows:—

1. The Union of S. Africa, a self-governing dominion of the British Empire formed in 1910 and consisting of the former colonies of the Cape, Natal, Orange River (Free State) and Transvaal.
2. The S.W. Protectorate (ex-German S.W. Africa), administered under mandate as an integral part of the Union.
3. The native protectorates of Basutoland, Bechuanaland and Swaziland, administered by the British Colonial Office.
4. Rhodesia, consisting of two separate administrations, S. Rhodesia and N. Rhodesia; both under the rule of the British S.A. Company.

Area and Population.—Including both Rhodesias the area of S. Africa is approximately 1,650,000 sq.m., of which some 125,000 sq.m. are Portuguese. The total pop. in 1921 was little over 11,000,000, of whom some 700,000 lived in Portuguese territory.

The following table shows the white population in the Union and in Rhodesia at the censuses of 1911, 1918 and 1921:—

	1911	1918	1921
Union of S. Africa	1,276,242	1,421,781	1,521,635
S. Rhodesia	23,606	..	33,621
N. Rhodesia	1,497	..	3,585
Total	1,301,345	1,421,781	1,558,841

The increase per cent. in the Union in the period 1911–21 was 19·23, masculinity (the number of males to 100 females) decreased from 115·92 to 106·14.

The next table gives particulars of area and pop. of British South Africa at the 1911 census:—

	Area Sq. m.	Pop. 1911 White	Native and Coloured	Total
Union of S. Africa:				
Cape Province	276,995	582,377	1,982,588	2,564,965
Transvaal Province	111,196	420,562	1,265,650	1,686,212
Natal Province (includes Zululand)	35,371	98,114	1,095,929	1,194,043
Orange Free State Province	50,392	175,189	352,985	528,174
Total Union	473,954	1,276,242	4,697,152	5,973,394
Territories:				
S. Rhodesia	148,575	23,606	747,471	771,077
N. Rhodesia	290,000	1,497	821,102	822,599
Total Rhodesia	438,575	25,103	1,568,573	1,593,676
Protectorates:				
Bechuanaland	275,000	1,692	123,658	125,350
Basutoland	10,293	1,411	402,434	403,845
Swaziland	6,536	1,083	98,876	99,959
Total Protectorates	291,829	4,186	624,968	629,154
Total British S. A.	1,204,358	1,305,531	6,890,693	8,196,224

Compared with the census of 1904 the increase in the white pop. was 172,390. Of this increase 123,285 was in the Transvaal. In Rhodesia the white pop. had nearly doubled in the seven years. The increase in the native and coloured pop. was 885,660. With respect to the coloured pop. two important factors must be remembered. (1) The Cape province total of native and coloured includes 391,000 persons with a marked strain of white blood, officially classed as "mixed"; the total "mixed" pop. being 435,000. (2) The Natal province total of native and coloured includes 133,000 Indians. There were also 10,048 Indians in the Transvaal, the total Asiatic pop. being 152,000.

The following table gives particulars of the white pop. of the Union by provinces at the censuses of 1911, 1918 and 1921:—

	1911		1918		1921	
	Males	Females	Males	Females	Males	Females
Cape Province	301,268	281,109	311,312	307,513	329,934	321,620
Natal	52,495	45,619	62,745	59,186	70,624	66,834
Transvaal	236,913	183,649	260,840	238,507	284,952	258,529
O. F. S.	94,488	80,701	93,969	87,709	97,971	91,171
Total, Union	685,164	591,078	728,866	692,915	783,481	738,154

The coloured pop. of the Union in 1921 was in round figures 6,000,000, that of S. Rhodesia 744,000 and of N. Rhodesia about 1,000,000, that of the native protectorates 750,000, that of S.W. Africa 240,000, or a total of about 8,750,000.

There were in 1918 five towns with a white pop. of over 20,000 and eight towns with a white pop. between 10,000 and 20,000. The following list of the five chief towns gives the total pop. at the 1911 census with the white pop. in 1918 in brackets:—Johannesburg 237,104 (137,166), Cape Town 161,759 (99,683), Durban 89,998 (48,413), Pretoria 57,674 (41,690), Port Elizabeth 37,063 (23,339). Outside the Union the only considerable towns in S. Africa were Bulawayo and Salisbury in Rhodesia, Swakopmund and Windhuk in the S.W. Protectorate and Lourenço Marques (Delagoa Bay) and Beira in Portuguese territory.

THE UNION OF SOUTH AFRICA

The Union of S. Africa came into being on May 31 1910. Minor amendments were made in the constitution during the next 10 years, but its main features (*see* 25.467) remained unaltered. In accordance with the electoral provisions—the basis of representation being the number of European male adults as ascertained by census taken every fifth year—the Transvaal province obtained nine additional seats in 1915, and four more seats were added in 1920. The seats allotted in 1920 were Cape 51, Transvaal 49, Natal and Orange Free State 17 each.

No alteration was made in the franchise laws. In the Cape province in 1919 out of a total of 186,000 voters, 33,000 were "other than European." In Natal the voters numbered 32,000, of whom 348 were "other than European." In the Transvaal (140,000 voters) and Orange Free State (47,000 voters), "Europeans" only, possess the franchise.

Agriculture.—The progress made in agriculture (including pastoral occupations) was in many respects the most encouraging feature in the economic development of S. Africa between 1910–21. The establishment in the Transvaal during the period of Crown Colony Government, of an agricultural department on scientific lines had given an impetus to the adoption of modern methods by the farmers, and the fusion, at the Union, of the agricultural departments of the four former colonies led to greater improvements. By withdrawing the control of agriculture from the provinces the Union Government was able to coördinate the work and to disregard artificial boundaries. Much of the progress was due to Gen. Botha "who with his instinct for things that really mattered" had held the portfolio of agriculture together with the premiership of the Transvaal, and in the Union was also for a considerable period minister of Agriculture as well as prime minister. General Botha gave full encouragement to the technical and scientific staff. Schools of agriculture—there were five in 1921—and experimental stations were established on large farms situated on main railway lines. A two years' course of instruction was provided as well as shorter courses and up to 1920 some 5,000 students had passed through the schools. Of the 300 experts in the department in 1921, over one-third were ex-students. Up to that year £1,000,000 had been spent on buildings and equipment.

The veterinary service did invaluable work in investigating the diseases of stock, discovering the causes of East Coast fever, and other diseases, some of which were eradicated. Its work rendered possible the keeping of animals in many districts where it had not previously been possible, and made profitable the importation of high-class live stock. In 1920 it was estimated that the value of the live stock in the country, chiefly cattle and sheep, was over £100,000,000. The entomological and botanical divisions were also active, one notable achievement being the ridding—at least temporarily—the country from locust plagues. This was done by tracking the locusts to their breeding places and as soon as the young were hatched (when they crawl, but do not fly) sprinkling them, and the surrounding veld, with a mixture of arsenic and molasses, a plan devised by a Natal farmer. This method proved so effective that in 1918–20 no swarms of locusts were reported in the Union.

New crops and plants were introduced, among them *teff* grass from Abyssinia, very valuable for hay, which in 1920 was grown on 234,000 acres. The general result of the Agricultural Department's work, backed by the rise in prices during the World War, was to make S. Africa almost self-supporting as regards food-stuffs, while in 1919 agricultural and pastoral exports were valued at £33,000,000, and in 1920, a year of depression—especially in the ostrich feathers trade—at £27,000,000. In the back-veld farming had been "transformed from what was little more than nomadic grazing to an organized industry and throughout had been placed on a higher plane."[1]

Of pastoral industries the breeding of woolled sheep is the oldest and most important. The number of woolled sheep in the Union was 21,842,000 in 1911, 26,490,000 in 1916 and 23,548,000 in 1919. The number of other sheep, 8,814,000 in 1911 had, however, declined to 4,943,000 in 1919. These figures did not include sheep in native locations, which in 1919 numbered about 2,250,000. The wool exported from the Union reached 176,971,000 lb. in 1913 and was 115,634,000 lb. in 1918. The World War sent up prices, the average price per lb. in 1913–4 being 7·95d. and in 1917–8 20·78d. In 1918–9 when the average price was 20·08d. the value of the wool exported was £14,648,000. Wool worth £5,678,000 went to the United Kingdom, £5,209,000 to the United States and £2,786,000 to Japan. France and Canada were the next largest customers. There is also a considerable trade in sheepskins; the value of the skins exported was £594,000 in 1911 and £1,329,000 in 1918.

South Africa produces more than half the world's supply of mohair. The Angora goats in the Union in 1918 numbered 5,278,000, mohair exported that year was 19,645,000 lb., valued at £1,641,000. The trade in mohair is subject to wide variations, and the limit of production in S. Africa is that of successful competition with Turkey for the supply of the Bradford market. In 1920 the value of mohair exported fell below £500,000, chiefly owing to lessened demand for yarn from Bradford by Poland and Germany.

The number of cattle in the Union rose from 5,796,000 in 1911 to 7,255,000 in 1919. The steady progress of the cattle industry is seen in the figures of imports and exports of meat.[2] Up to and including 1913 imports greatly exceeded exports. Thus in 1913 the quantity of meat imported was over 11,000,000 lb., and that exported but 1,387,000 lb. In 1917 the imports had fallen to 23,000 lb., while the exports had leapt to 47,250,000 lb. (valued at £1,043,000). This was an exceptional war-time condition, but in 1919 while there were no imports the exports reached 44,408,000 lb. In 1916, for the first time, sufficient butter and cheese were made in the Union for all local requirements and something left over for export. The total export of butter in 1918 was 1,316,000 lb., of cheese 424,000 lb. In 1919 butter exports fell to 452,000 lb., but that of cheese increased to 1,546,000 pounds.

Large areas of S. Africa are well adapted to horse-breeding; in general, horses do well wherever conditions are best suited for sheep. The numbers of horses in the Union in 1919 was 695,000, of mules 81,000, of asses 498,000. These figures do not include horses, etc., in native locations.

Ostrich-farming suffered severely through the World War. In 1913 the industry had attained unprecedented success, when feathers weighing 1,023,000 lb. valued at £2,953,000 (an average value of £2 17s. 9d. per lb.) were exported. In that year there were 776,000 ostriches in the Union (757,000 of them in the Cape province). Over-production and the effects of the war in five years brought about an almost total collapse of the feather trade; the export fell by three-fourths and prices to 15s. a lb. Many breeders took up other branches of farming and by 1920 few persons were wholly dependent on ostriches for their living. The stock of birds was greatly reduced (it was 314,000 in 1918), only those of finest plumage being retained.

The pig and bacon industry is a development wholly post-Union. Pedigree animals were imported but the industry had barely got beyond infancy in 1920. The total production of bacon in the Union in 1917–8 was slightly over 7,000,000 pounds.

Among cereals the most important crop is maize. The maize belt covers a large area in the eastern portion of the Union, chiefly in the Transvaal and Orange Free State. There is an expanding home market for maize and an assured overseas market. The quantity of maize exported was 356,000,000 lb. in 1910 valued at £693,000 and 509,000,000 lb. in 1918, valued at £1,600,000. Kaffir corn, grown chiefly by natives, specially valuable for fodder in regions too dry for maize, was also an increasingly valuable crop. The area under wheat is mainly in the western part of Cape province; the production, 362,000,000 lb. in 1911, rose to 608,000,000 in 1917–8, but fell the next year to 478,000,000 lb. Of oats 48,454,000 lb. were exported in 1919.

---

[1] Consult a paper on S.A. Agriculture by F. B. Smith, sometime secretary of the S.A. Agricultural Department, read at a meeting of the Colonial Institute, May 31 1921.

[2] The figures relate to beef and mutton but the quantity of mutton exported is small, 62,000 lb. in 1910 and 46,000 lb. in 1919.

Sugar plantations are confined to Natal and Zululand. The area under sugar in 1916–7 was 163,000 ac., the production that year being 114,000 tons and the value £3,134,000. In 1919–20 the output was approximately 180,000 tons, of which over 30,000 tons were exported. The cultivation of tea declined, sugar yielding greater profits; the yield for 1916–7 was 1,747,000 lb., compared with 2,681,000 in 1903, the year of highest production. Tobacco production did not show great variation in quantity during 1910–20, the yield being 15,000,000 to 17,000,000 lb. yearly, but there was considerable alteration in the class of tobacco grown, due to the increased demand for light and medium varieties. Cigarettes from locally grown Turkish tobacco became very popular.

Fruits of many varieties are produced for which there is a very large home demand, especially in the mining areas. The export trade, in fresh, bottled, canned and dried fruit and in jams showed a fair amount of extension and in 1919 was valued at £125,000.

Plantations of black wattle for the production of tan-bark cover about 250,000 ac., of which 160,000 are in Natal. Before the World War the bark was taken by Germany; factories for the production of the extract were erected in Natal in 1919 and the extract sent to Great Britain. The value of the exports increased from £269,000 in 1916 to £412,000 in 1918.

Irrigation.—Considerable progress was made in local irrigation schemes, but no great project had been undertaken by the Union Government up to 1922. The opposition of vested interests stood in the way of an adequate water law for the whole country, but in 1912 an Irrigation and Conservation of Waters Act was passed and an Irrigation Department created. Provision was made for irrigation loans to private persons and to irrigation boards, and for hydrographic surveys, etc. The government expenditure on irrigation increased from £276,000 in 1912–3 to £573,000 in 1917–8. By 1920 schemes involving an expenditure of £2,500,000 had been approved. The Sunday river, Cape province, irrigation works were the largest then under construction and were designed to bring 42,000 ac. under cultivation.

Mining.—Despite appearances the most valuable mineral in S. Africa is coal. The position was put succinctly in 1920 by Mr. U. P. Swinburne, Chief Inspector of Mines, when he wrote in the *Official Year Book of the Union* "S. Africa has made its name through the production of gold and diamonds, but it is mainly due to the existence of cheap coal that the large output of gold and diamonds has been made possible. On the Witwatersrand proper only a few mines would be working at the present time if a plentiful supply of cheap steam coal was not available." Opinions of experts on the life of the gold mines on the Rand differ; the report of the Union Economic Commission, presented early in 1914, estimated that 550,000,000 tons of payable ore remained in the mines then working. This figure was very much less than had been expected. Since that year new mines on the Far Eastern Rand have been developed. Mr. P. A. Wagner, in his presidential address in 1918 to the S.A. Association for the Advancement of Science, hazarded the conjecture that £1,200,000,000 worth of gold remained to be extracted and that 50 years ahead some of the mines might still be profitably worked. But gold production on the Rand is so costly that a slight rise in costs has on many mines a disastrous effect.

With regard to diamonds their abundance is unquestioned, and a policy of limiting supplies to keep up prices is adopted. Even so most of the diamond mines were shut down in 1920–1, a striking example of the economic depression prevailing, S.A. being the only considerable source of the supply of diamonds in the world. Depression in prices led also in 1918 to the closing of the copper mines in Namaqualand, Cape province.

Since 1912 the gold industry has become increasingly dependent on the development of the Far East Rand. Thus in 1918 the dividends paid from the Far East Rand mines amounted to £3,344,000, compared with £1,929,000 from all other Rand mines. The value in sterling of the gold output from the Transvaal mines rose from £31,973,000 in 1910 to £39,489,000 in 1916. This was considered the high water mark.[1] The value in 1917 was £38,306,000, in 1918 £35,758,000, in 1919 £35,389,000 and in 1920 £34,652,000 (for the first half of 1921 the output was £16,671,000).

The statistics of the output of diamonds reflect the purchasing power of the public. The market is strictly controlled by the producers and the only diamond field of importance which was outside the Union—that of ex-German S.W. Africa—as a result of the World War came into line with the other S.A. mines. In 1914, shortly before the war began, a conference of representatives of the diamond industry was held in London with the object of regulating the output from each mine. Though no binding agreement was then made such an arrangement is virtually in force. The value of the diamonds extracted in 1910 was £8,746,000, in 1913, the last full year before the war, £11,389,000. In 1915 diamond mining almost ceased, the total output that year being valued at £399,000. The mines restarted in 1916, when the value of the output was £5,728,000. In 1918 the figure was £7,114,000 and in 1919 had risen to £11,734,000, thus exceeding the record of 1913. The year 1920 began well and ended badly; the market was overstocked and purchasers few. The overstocking of the market was attributed by the De Beers Co. to the sale of diamonds by the Russians—by the Soviet Government to obtain goods and by private individuals who had lost other means of subsistence. The Rhodesian output of diamonds is very small; the De Beers Co. has the right to dispose of all diamonds found in the territory. In the Premier mine, Transvaal, the system of open working still prevailed in 1921. In Sept. 1917 a fine stone of 442 carats was found in the Dutoitspan mine, Kimberley.

A very marked development of coal mining took place between 1910 and 1921. The mines of the Cape province, which yield only poor quality coal, were nearly all abandoned as the richer deposits in Natal and the Transvaal were opened up. The output from the Cape exceeded 100,000 tons for the last time in 1909, in which year the Natal fields first yielded over 200,000 tons. The total output from the Union rose from 7,112,000 tons valued at £1,869,000 in 1910 to 10,382,000 tons valued at £3,275,000 in 1917 and was 10,266,000 tons in 1919. Besides supplying cheap fuel for the gold and diamond mines and other purposes, the coal is in great demand for bunkering ships and for export to India, E. Africa and S.A. ports. In 1919 Union coal bunkered was 1,427,000 tons; coal exported 1,092,000 tons (half of these exports going via Delagoa Bay).

The output of tin, mined almost entirely in the Waterberg and Olifants river districts, Transvaal (3,672 tons in 1913 valued at £436,000), had dropped in 1918 to 1,900 tons valued at £277,000.

Copper output increased with the opening of the railway in 1913 to the Messina mines on the Limpopo. These with the Namaqualand mines represented the copper output of the Union, which in 1916 with 22,800 tons reached a value of £1,137,000. In 1919 the output sunk to 4,900 tons valued at £208,000.

Trade and Shipping.—The following table gives the total of imports and exports to and from the Union for 1911, the first complete year after the Union had been established, for 1915, the year of the greatest restrictions of trade owing to war conditions, and for 1919. The exports include diamonds and gold, the imports government stores and specie:—

Year	Imports	Exports	Total Trade
1911	£38,035,000	£57,308,000	£95,343,000
1915	£33,833,000	£35,012,000	£68,845,000
1919	£50,791,000	£104,561,000	£155,352,000

Trade in 1920 was conditioned by the world depression, which did not become marked till the second half of the year. Imports in the first six months showed a large increase, being £48,000,000 against £28,000,000 in the corresponding period of 1919, and for the whole year exceeded £90,000,000. Exports for the first six months of 1920 showed a comparatively small decline, being £51,000,000 as against £58,000,000 for Jan.–June 1919, but for the whole of 1920 the total was only £72,000,000.

The distribution of trade by countries was as follows in 1910 and 1919:—Imports (1910) United Kingdom 59%, (1919) 46%; other British lands (1910) 11%, (1919) 17%; United States (1910) 8%, (1919) 24%; other countries (1910) 22%, (1919) 13%. Exports (excluding gold) United Kingdom (1910) 80%, (1919) 61%; other British lands (1910) 1%, (1919) 8%; United States (1910) 17%, (1919) 24%; other countries (1910) 17%, (1919) 15%.

Nearly all the external trade of the Union passed through Durban, Cape Town, Port Elizabeth and East London. The only non-British port which had a share in the trade of the Union was Delagoa Bay. In 1913 Delagoa Bay had 12% of the trade, in 1918 only 8% (*see* DELAGOA BAY). Of neighbouring countries the chief trade was with Rhodesia, Portuguese E. Africa and the Belgian Congo. The exports to British E. Africa (Kenya Colony) increased from £19,000 in 1913 to £396,000 in 1918; in the same period the imports from British E. Africa rose from £16,000 to £139,000. Of foreign countries outside Africa and excluding the British Empire and the United States, France and the Argentine were the chief traders with the Union. As to overseas carrying trade the British proportion of cargo shipped in 1918 was 79·85% and the Japanese 7·51. Of cargo landed the British proportion was 69·17% the Japanese 10·12% and the American 9·43%.

The value of the preferential treatment accorded certain articles of merchandise imported into the Union from the United Kingdom, Canada, Australia and New Zealand is shown by the following figures:—In 1913 on imports valued at £22,498,000 the amount rebated was £628,000; in 1918 on merchandise worth £25,158,000 the rebate was £698,000.

The number and tonnage of vessels entered at Union ports (including the coastwise trade) was as follows in the years named. The figures represent the gross number of vessels using the Union ports, *i.e.* the same vessel, if it called and cleared at Cape Town, Port Elizabeth and Durban, would be entered three times. The tonnage of vessels cleared is not given, it corresponds closely to the figures of tonnage entered.

---

[1] The total value of gold mined in British S. Africa in 1916 was £43,416,047: of this total £3,859,111 came from Rhodesian mines, £31,726 from the Tati goldfields, £1,336 from Natal and £132 from Cape province. The Natal mines in 1915 had yielded over £10,000.

Year	No. of vessels entered	Net tonnage British	Net tonnage Total
1913 .	4,349	10,586,000	12,939,000
1915 .	3,322	7,298,000	7,937,000
1917 .	3,888	7,682,000	9,252,000
1919 .	3,060	6,642,000	7,608,000

The number of German ships entering Union ports in 1913 was 230, of 723,000 net tonnage.

Communications.—Nearly all the railways in the Union are state owned. Railways and harbours are under the control of a Board, whose finances are independent of the other revenue departments. The mileage of railways open in 1910 was 7,586, of which privately owned lines had a mileage of 545. In 1919 the mileage open was 10,049, of which government lines had 9,542 mileage. It will be seen that development was rather slow, an average of 246 m. a year in a period of 10 years. The total expenditure on new lines in these 10 years was £9,113,000. The principal new line, that from Prieska to Kalkfontein connecting the Cape and S.W. Protectorate systems, was built for military purposes. The extension in 1913 of the railway from Krugersdorp via Zeerust to Mafeking brought Johannesburg and Bulawayo within 680 m. of one another (instead of 975 m. via Fourteen Streams) and made Mafeking the business centre for the western Transvaal. The opening, also in 1903, of the Messina railway, afforded the opportunity, by the building of a connecting line to W. Nicholson in S. Rhodesia of putting Bulawayo in direct communication with Delagoa Bay. But, up to 1921, the needed link had not been built (*see* RHODESIA). In the Cape province the completion of the Mossel–Bay–George–Oudtshoorn line gave a much more direct connexion between Cape Town and Port Elizabeth reducing the distance from 910 m. (via de Aar) to 684 m. (the distance by sea between the two ports is 436 nautical miles). The adoption of electricity on a number of lines, including the main line from Durban to Glencoe was recommended in 1920 by the government's consulting engineer. The scheme was adopted by the ministry for the Cape Town–Simon's Bay line and for the Natal main line from Durban as far as Maritzburg. With the electrification of the Durban–Maritzburg line a new alignment was undertaken as part of a scheme for rebuilding the whole line from Durban to the Rand.

The Railways and Harbour Board after the World War took over control of the railways in the S.W. Protectorate. The total railway mileage in the Union and Protectorate at the beginning of 1920 was 11,334. Up to March 31 1920 the capital expenditure on Government railways was £96,408,000. The gross earnings in 1919–20 were £19,169,000 and working expenses 78·9% of the gross earnings.

The use of motor vehicles greatly increased from 1913 onwards (when over 4,000 cars were imported), farmers having by then learned their value. In 1919 over 16,000 vehicles were licensed. Nearly all the cars came from America (United States and Canada), but heavy motor lorries were imported from England. Notwithstanding this development of motor traction the trek ox was still employed though in decreased numbers.

The extension of the telegraph system kept fair pace with the needs of the community, and wireless stations were erected at Durban, Cape Town and (in 1921) at Port Elizabeth. These were not of high power, the guaranteed range (at night only) not exceeding 1,500 miles. Wireless telephonic stations were added in 1921.

With respect to the mail service to England no improvement in speed was made. A contract to run for 10 years from Oct. 1 1912 was entered into with the Union Castle Co. for a weekly service to and from Southampton, the duration of the voyage to be 16 days 15 hours. The subsidy paid was £171,000 yearly, of which £21,000 was in consideration of the mail steamers beginning and ending their voyages at Durban instead of Cape Town. The contracting parties were on the one hand the steamship company and on the other hand Great Britain, the Union, Southern Rhodesia and the Bechuanaland Protectorate. Postal communication with Australia, India and the Far East was maintained by private ships as opportunity offered. A steamship service between Holland and S. Africa, subsidized by the Netherlands Government, was established in 1920, and in 1921 a direct service between S. Africa and Vancouver was started by the Canadian Government. While some £10,000,000 or more a year was spent on harbour works except at Durban (*see* DURBAN) the facilities for shipping were not greatly extended, and Cape Town suffered from lack of adequate dock accommodation.

Air travel developed slowly. The first aeroplane flight was made in 1910 in a Voisin biplane. Little progress was made in civil aviation until after the World War, when, in 1919, aerodromes were laid out at Wynberg, Bloemfontein, Johannesburg and other places as stages on the cross-Africa route. The first flight from Cairo to Cape Town was made in 1920 by two S.A. military pilots. In the same year an Aero Club for S.A. was formed at Cape Town.

Education.—"Education, other than higher education," which definition in practice was held to include all education other than university, is controlled by the provincial councils. The standards and methods differ in each of the four provinces but in general provision is made for a sound training of white and coloured (as distinct from native) children. A matter which aroused acute dissensions before and in the two years immediately following the establishment of the Union was the question of the medium of instruction. By law the English and Dutch languages were in a position of equality. An attempt to favour Dutch was made in the Transvaal schools, while in the Free State the education authorities tried to enforce bi-lingualism, insisting that English-speaking children should be taught in the medium of Dutch. Eventually all four provinces adopted the principle recommended by the Union Parliament in 1911, namely that the medium of instruction up to standard IV. should be in the "home" language of the scholar, and that above that standard freedom of choice should be left to the parents. The compromise worked and in June 1912 the private schools which had been opened by the English speaking residents in the Free State in 1910 as a protest against compulsory bi-lingualism were handed over to the provincial administration. The subject of religious instruction presented little difficulty. The practice in each province in all public schools is for school to be opened with prayer and a reading from the Bible. Scripture teaching, subject to a conscience clause, is generally provided; sectarian teaching under certain conditions is allowed in the Cape province by an ordinance passed in 1913. The number of schools in the Union for white children increased from 3,873 in 1910 to 4,846 in 1918; in the same period the schools for coloured children increased from 1,999 to 2,877. The number of white scholars in 1910 was 163,200, in 1918 the number was 283,100. The coloured scholars had increased in the same period from 136,000 to 220,100. The teachers had increased from 10,912 to 18,301, and the expenditure from government funds had grown from £1,597,000 to £3,631,000. Private schools were not numerous; there were 270 in the Union in 1918, of which 96, the oldest dating from 1880, were in the Cape province. There were then in the Union 135 private schools founded since 1910.

State and state-aided schools for natives are provided in all the provinces, and in Natal and the Transvaal there are special schools for Indians. The expenditure on native schools rose from £81,000 in 1911 to £137,000 in 1918. In Natal in 1918 the government established an institution for training the sons of chiefs and *indunas* in the special duties they are called upon to perform. The education of the natives remained, however, very largely in the hands of missionary societies, though there was a growing inclination, among the natives, particularly in the Transkeian territories, to secularize education and to obtain a larger direct share in its management. Of the 23 principal institutions which in 1919 provided higher education for natives—literary, commercial, industrial, agricultural and training for the ministry—12 were in Cape province, the largest and most comprehensive being the famous Lovedale College. The most important step in regard to higher education of natives was the establishment in 1914 of the S.A. Native College on a site at Fort Hare, Cape province, given by the United Free Church of Scotland. To this college the natives and the missionary societies, Presbyterian, Anglican and Wesleyan, contributed; the Union Government gives an annual grant. The college aims at providing education of university standard and is open to coloured and Indian students.

The system of higher education was reorganized in 1918, after much heated controversy (*see* below § *History*). Under the new scheme the university of S. Africa, with headquarters at Pretoria, which replaced the university of the Cape of Good Hope, is an examining body, having the following constituent colleges:—Grey University College, Bloemfontein, Huguenot College (for women), Wellington, Natal University College, Pietermaritzburg, Rhodes University College, Grahamstown, South African School of Mines, Johannesburg, and Transvaal University College, Pretoria. The new university of Cape Town provides for the residence as well as the teaching of students (men and women). A special feature of the new Stellenbosch University is its agricultural faculty (the Transvaal University College has also an agricultural faculty). The number of university students in the Union increased from 1,171 in 1910 to 2,069 in 1918. In the last-named year the expenditure on higher education in the Union was £240,000.

Finance.—The unitary system of government adopted in 1910 was strongly marked in the financial provisions made. All public revenues were payable to the Union Government, and the funds needed to carry on the administration of the provinces were provided by grants from the Union Exchequer. By the Financial Relations Act which came into force in April 1913 the Union Parliament assigned the revenue derived from transfer duties, liquor licenses and native pass fees in Transvaal labour districts to the provinces, but gave the provinces no power of legislation in regard to such revenue. Other sources of revenue, such as education fees, trading and professional licenses were assigned to the provinces with power of legislation in regard thereto. A subsidy from Union funds of one half the ordinary expenditure of the provinces was also made, plus additional subsidies to Natal and the Orange Free State whose funds were shown to be inadequate to meet the necessary expenditure. The provinces are not allowed to borrow from any other source than the Union Treasury.

All trust moneys, (*e.g.* post office savings bank moneys) are handed over for investment to the Public Debt Commissioners. Any yearly surplus of revenue over ordinary expenditure is paid to the Commissioners and by them applied to the redemption of debt.

Revenue and expenditure of the Union is divided into two distinct funds, the ordinary or general, and the railway and harbours.

The following table shows the ordinary revenue and expenditure, for three typical financial years:—

	1913–4	1916–7	1920–1
Revenue	£15,980,000	£18,617,000	£28,381,000
Expenditure .	£14,289,000	£15,490,000	£28,890,000

The chief sources of revenue for the year 1919–20, were as follows: customs, £5,010,000; interest, £4,277,000; income, super, and dividend taxes, £4,050,000; posts, telegraphs and telephones, £2,031,000; excise, £1,228,000, and mining revenue, £1,023,000. The native poll and hut taxes produced altogether, £830,000. Among the main items of expenditure for the same period were: public debt, £6,940,000; provincial administrations, £3,520,000; justice, £3,209,000; postal, etc., services, £2,144,000; defence, £1,575,000; pensions, £1,200,000; interior, £1,019,000; agriculture, £861,000, and public works, £614,000.

Railway and harbour finance is controlled by a board presided over by a cabinet minister. The management of harbours and railways is required to be upon business principles. The following table shows receipts and expenditure for these services in the years named:—

	1913	1916	1918–9
Harbours (receipts) .	£1,039,000	£1,031,000	£939,000
" (expenditure)	£900,000	£656,000	£479,866
Railways (receipts) .	£12,388,000	£13,257,000	£11,680,000
" (expenditure)	£8,964,000	£8,891,000	£15,282,000

The war expenditure of the Union was met out of loan funds, the total charge on such funds amounting on March 31 1920 to £29,736,000. At the same date the public debt of the Union was £173,905,000.

The South-West Protectorate

After the surrender, in July 1915, of the German forces in S.W. Africa Gen. P. S. Beves was appointed military governor of the protectorate.[1] None of the German inhabitants was then repatriated and while the regular troops were placed in internment camps the civilians were allowed to return to their homes and continue their ordinary business. Mr. (afterwards Sir) E. H. L. Gorges, Secretary of the Interior in the Union, who had at Gen. Botha's request already drawn up a scheme for the future administration of the protectorate was made chief civil secretary. On Oct. 30 1915, on Gen. Beves's departure the two offices named were abolished and the functions of both taken over by Mr. Gorges with the title of Administrator. This post he retained until nearly the close of the military occupation period, which lasted till the end of 1920. Martial law remained in force but in a mild form and the administration was on civilian lines. At the beginning of 1917 it was found necessary to send an expedition to Ovamboland, the northern and most populous part of the protectorate, where German authority had been very slight. A chief named Mandume proved recalcitrant and two battalions, the first and the fourth of the S.A. Mounted Riflemen, together with a composite regiment of military constabulary were sent against him, Col. de Jager being in command. The expedition, despite fever, flood and dense forest, as well as the opposition of the natives, was successful. Excellent relations were afterwards established with the Ovambo.

In the rest of the protectorate S.A. rule was from the first welcomed by the natives, and the Germans gave no serious trouble. Until nearly the close of the World War they believed that the British occupation was temporary, being confident in the ultimate victory of Germany. This was evidenced by the fact that the German banks and traders maintained a rate of exchange of 24 marks to the £ sterling until Nov. 1918—the month of the Armistice. Instances were known of farmers selling their stock for sterling and converting it into paper marks. Where the artificial rate of exchange broke down serious losses followed. The Germans, however, continued to entertain false hopes, and after the Armistice they wrote to President Wilson asking his help on "self-determination" lines. They desired, they said, to become an autonomous republic leagued to the German republic, and this solution, they gratuitously added, would, they believed, meet the wishes of the natives. In 1919 the German soldiers—about 5,800 in all—together with some 600 "undesirables" were repatriated. This still left, according to official figures, over 9,000 Germans in the protectorate. These German settlers continued hostile to Union rule, and obnoxious to authority. Lord Buxton, then governor-general of the Union, who visited Windhuk, the capital, in Oct. 1919, took occasion to inform them that the severance from Germany was irrevocable, and that the protectorate would in future form an integral part of the Union. Gen. Smuts when on an official visit to the territory in Sept. 1920 used similar language. The Germans had informed him that the country should be administered as "an independent province," and that the German civil code should continue, arguing that the introduction of the Roman-Dutch law would be "a retrogression of centuries." They also asked for the recognition of German as an official language, and the maintenance by the State of the German schools, but were refused.

By the treaty of Versailles Germany had renounced sovereignty over the protectorate, and in accordance with its provisions the Supreme Council in May 1919 assigned the mandate for the territory to the Union of S. Africa. An Act was passed by the Union Parliament in Sept. 1919 to give effect to the mandatory powers; finally the mandate was confirmed by the Council of the League of Nations on Dec. 17 1920. On Jan. 3 1921, martial law was withdrawn and Mr. Gysbert Hofmeyer, who had succeeded Sir Howard Gorges as Administrator in Oct. 1920, was given a nominated advisory council of six members. This council met for the first time on Feb. 2 1921.

Settlers and Industries.—In general the laws in force in, and the economic policy of, the Union was applied to the protectorate from the early days of Sir Howard Gorges's rule. Walfish Bay, the only good harbour on the S.W. coast, had languished. It had formed a small British enclave in what was German territory, and without hinterland, served only the purpose from which it got its name—a whaling station. Swakopmund was an artificial and poor port. The Union authorities built a line (22 m. long) from Walfish Bay to Swakopmund, and thus gave the protectorate its natural sea outlet. The whole length of the line from Walfish Bay to Windhuk was relaid on the standard S.A. gauge of 3 ft. 6 inches. In 1921 the Railways and Harbour Board undertook the construction of a line (132 m. long) eastward from Windhuk to Gobabis.

While no crown lands were alienated up to 1921 temporary licenses were granted and many members of the army of occupation on demobilization settled in the country with their families. A fairly large British-Dutch population soon grew up, evidenced sufficiently by the fact that in 1920 there were 975 children attending Government schools.[2] The new settlers were chiefly engaged in stock raising and farming; the copper, tin, and diamond mines were already in beneficial occupation, largely with British capital. The Otavi mines in the years 1916–8 produced 100,000 tons of copper ore, valued at £600,000. The expectation that the Lüderitzbucht (Luderitz Bay) diamond fields would be thrown open to all comers was not realized. At the end of 1915 some of the companies on the diamond field were allowed to resume work; between Oct. 1915 and Jan. 1919 diamonds valued at £1,900,000 were obtained. Later the whole diamond field came under the control of one company, which entered into a working arrangement with De Beers and other diamond mining companies in the Union. The depression in trade led, in 1921, to the temporary closing of the mines. Depending upon diamonds for prosperity, was, declared Mr. Hofmeyer, like building on sand.

Trade and Revenue.—During the war external trade was all overland with the Union, trade being facilitated by the line built in 1915 from Prieska to Kalkfontein to connect the two railway systems. Customs duties were those in force in the Union, with free trade between the Union and the protectorate. During 1918 the value of imports was £1,031,000, about one half being S.A. produce. Of the total imports £409,000 represented the value of food and drink, and £181,000 cotton goods. The value of exports in 1918 was £817,000. The chief items were, diamonds £652,000, copper ore £55,000, cattle and small stock £57,000, horns, hides and skins £35,000.

The revenue of the protectorate in the financial year 1917–8 was £295,000; and in 1918–9 £377,000, of which £275,000 was from the tax on diamonds. The expenditure for the two years named was £650,000 and £744,000; as to more than three-fourths the expenditure was on the upkeep of the garrison.

Native Affairs.—Nowhere else had German methods of dealing with the natives been more ruthless than in S.W. Africa. The result of an examination of German judicial and administrative methods and documents was made public in 1918. It showed that not only during the Herero and Hottentot wars but in peace time the natives were systematically subjected to brutalities and robberies, by the Government as well as by the settler. One consequence was that, apart from Ovamboland, where the Germans had little authority, the native population had decreased from some 130,000 in 1904 to 37,000 in 1911. In 1920 it was estimated at 80,000. To reconstruct, as far as practicable, tribal organization, Sir Howard Gorges established native reserves (over 4,000,000 ac. in all) controlled by hereditary chiefs, when such survived, or by an elected or nominated headman. To these men small salaries were given. Rules to protect natives in the railway and other public departments and in European private service were enforced.

---

[1] For earlier events *see* GERMAN SOUTH-WEST AFRICA.

[2] The German settlers had separate schools. Efforts were made in 1921 to induce them to abandon these schools. They were offered "mother-tongue" instruction up to standard VI., coupled with the compulsory learning of either English or Dutch.

THE NATIVE PROTECTORATES

No change was made in the political status of the native protectorates—Basutoland, the Bechuanaland protectorate and Swaziland—in the period 1910–21. They remained under the control of the Colonial Office, represented by the High Commissioner for S.A. and were administered by resident commissioners. They form in whole, or in greater part, native reserves, and the Basuto and Bechuana showed marked disinclination to incorporation in the Union of S. Africa. All three protectorates prospered.

Basutoland.—At the 1921 census the people numbered 500,544 (of whom 1,615 were whites and 155 Asiatics) compared with 403,845 in 1911 and 348,848 in 1904; of the total pop. in 1921 males numbered 224,435 and females 276,109. Maseru, the capital and largest town had (1920) approximately 900 native and 500 white inhabitants. Outside Maseru, the white residents are nearly all officials or missionaries. Ownership of land by whites is forbidden. Some 20,000 male Basutos are normally employed outside the country—mostly on the Rand gold mines. Agriculture and stock raising are the chief occupation of the people.

Education is in the hands of the missionary societies, except for four small Government schools. In 1919 there were in all 344 schools with 28,500 scholars, most of the schools being maintained by the French Protestant Mission (the Paris Evangelical Society). Grants in aid are made by the administration (£25,000 in 1920–1). Serious crime is rare and the drinking habits of the people, which once threatened their destruction, have been very largely abandoned under missionary influence. About one-fourth of the Basutos prefers Christianity. Trade is almost exclusively with the Cape and Free State provinces; the Basuto export grain, cattle, wool and mohair, and horses; and import mainly clothing, ploughs, saddlery, iron and tin ware, and groceries. The value of imports increased from £239,000 in 1908 to £1,137,000 in 1919. In the same period the value of exports rose from £193,000 to £1,380,000—in part due to inflated prices obtained for wool and mohair.

Financially Basutoland is self-supporting. Revenue is obtained from customs, licenses and, principally, from the poll tax on natives. This tax was substituted in 1911 for the hut tax previously enforced. A tax of £1 per annum on adult males was then put in force, but if a Basuto had more than one wife, he paid £1 per annum for each wife, up to a maximum of £3 for himself and his wives. This tax yielded £92,000 in 1913 and £106,000 in 1918–9. Total revenue increased from £145,000 in 1910–1 to £199,000 in 1919–20; the corresponding figures for expenditure were £134,000 and £202,000.

The system of government which under a resident commissioner allows a measure of home rule to the Basutos continued to work well. The *pitso* or national council meets yearly, 95 out of its 100 members being nominated by the chiefs and the other five by the administration. It has advisory powers only, but its advice is often taken. Sir H. C. Sloley who had been resident commissioner since 1901, and who earned the full confidence of the people, was in Dec. 1917 succeeded by Lt.-Col. E. C. F. Garraway. Letsie II., who had been paramount chief since 1905, died in Jan. 1913. He was a great grandson of Moshesh, the founder of the Basuto nation and dynasty, and was succeeded by his brother Griffith. When the World War began Griffith and his people offered to raise regiments for combatant service. The offer was declined, to the grief of the Basutos, to whom service with the labour contingent did not appeal. However, 1,400 Basutos served with the S.A. Native Labour Contingent in France, and many were employed in S.W. and E. Africa. The Basuto also contributed £50,000 to war funds. In 1921 the new High Commissioner, Prince Arthur of Connaught, visited Maseru, and the presence of a member of the royal house was made the occasion for a national tribute by the "Sons of Moshesh"—as the Basutos call themselves—to their loyalty to the British throne and their wish to remain directly under imperial control.

Bechuanaland.—The Bechuanaland protectorate is a much poorer country than Basutoland and the Bechuana are a less virile race than the Basuto. Bathoen, paramount chief of the Bangwaketse, died in July 1910 and Sebele, paramount chief of the Bakwena, died in Jan. 1911. Montsioa, chief of the Baralong, died in April 1911. All these chiefs were noted men in the early struggles between the Boers and British for the possession of Bechuanaland, Sebele being a son of the chief Sechele, the friend of David Livingstone. Khama, the chief of the Bamangwato, and a Christian from his youth, still survived in 1921 and had then ruled over his people with undisputed authority for some 50 years.

The Bamangwato are the largest tribe, numbering about 40,000. The people grow maize, kaffir corn and other crops but their chief wealth is in cattle, and cattle hides and skins are the chief exports. Firewood and timber for mining props are also exported. In 1917–8 exports to the Union included 23,600 horned cattle and 36,000 sheep and goats. The chief markets are Kimberley, Mafeking and Johannesburg. For customs purposes the protectorate is dealt with as part of the Union and no statistics as to value of imports and exports are kept. Revenue, £52,000 in 1910–1, first exceeded expenditure in 1915–6, when the figures were revenue £70,000, expenditure £68,000. In 1919–20 revenue was £81,500, expenditure £91,600. Deficits were made good by grants from the Imperial Exchequer. The seat of the administration is Mafeking, in the Cape province. Mr. J. C. Macgregor became resident commissioner in 1917. Khama's headquarters are at Serowe (pop., 1920, about 25,000).

Swaziland.—At the 1921 census the inhabitants numbered 113,772, of whom 2,203 were whites. Of the total pop. 54,702 were males and 59,070 females. The state of chaos into which Swaziland had fallen owing to the indiscriminate grant of concessions (*see* 26.181) was ended by 1914. The partition of rights between the European concessionnaires and the Swazis was completed in 1911, and those natives who were required to move from properties held by whites by July 1914, did so voluntarily—such as did move, for many natives made terms with the concessionnaires and remained on their farms. Out of a total area of 4,274,000 ac. 1,635,000 ac. were set aside as Swazi reserves; in addition the Swazis bought 77,000 acres. The Swazis raise maize and other crops and own large stocks of cattle while 7,000 to 10,000 Swazis are usually at work on the Rand mines. The whites engage in agriculture, including fruit farming and cotton and tobacco growing and in mining. The gold mines, which produced 6,497 oz. in 1915–6, were closed down as unprofitable in 1917. Tin of a total value of £346,000 was produced in the years 1915–20. The large coal deposits in the protectorate had not been exploited up to 1921. No separate statistics of Swaziland trade are kept. Revenue which in 1910–1 was £58,000 had risen to £91,800 in 1919–20. Expenditure in the same period rose from £62,000 to £87,000. The settlement of the concessions' questions cost £182,000.

The administration is under the charge of a resident commissioner, with headquarters at Mbabane, a small, picturesquely situated hill village (altitude 4,000 ft.) overlooking the middle veld. The paramount chief and other chiefs exercise jurisdiction in all civil cases in which natives only are concerned. Naba Tsibeni, the "queen regent," a well-known figure in Swazi history acted for many years as paramount chief, until the coming of age of her grandson Sobhuza (born about 1900). Education is mainly in the hands of missionaries; Sobhuza was educated at a Government school established at Naba Tsibenis Kraal. Mr. De S. M. G. Honey who had served in Swaziland since 1904 became in 1917 resident commissioner.

HISTORY

The 12 years (1910–21) following the establishment of the Union of S.A. were marked by political, racial and industrial crises which profoundly affected the future of the country. The most urgent issue was raised by a powerful section of the Dutch community, which revived a narrow Nationalism and developed a demand for the separation of the Union from the British Empire. Coupled with this conception went strong opposition to action against Germany, or any share in the World War. But this Nationalist section, whose greatest figure was ex-President Steyn and whose mouthpiece was Gen. Hertzog, was unable to control events. The policy of Gens. Botha and Smuts of "building up a new State on non-racial lines" and as an equal member of the British Commonwealth prevailed.

Besides this main issue the growth of an organized Labour party, which found its chief stronghold on the Rand and put forward an advanced socialistic programme, presented perplexing problems to a community new to such manifestations. The position of Indians in the Union, and the resolve of the white races to prevent further immigration of Asiatics was another problem which caused acute controversy, only partially silenced by the ultimate assent of the Government of India to the policy of exclusion. And behind all these questions was the ever-present problem of the relation between the white and native races. Signs multiplied that the Bantu peoples, gaining in knowledge and an increasing factor in industry, had acquired a sense of race solidarity and would not rest satisfied with their existing economic, social and political status.

While these racial and political questions held the field they were accompanied by a steady development of the material resources of the country and of trade. The progress in agriculture and in mining was marked; a beginning was made in manufactures. The benefit of unification in this respect was apparent. That benefit was even more apparent in the relations of S.A. with the outside world; she spoke with one voice and as a powerful unit. The new position which S.A. had acquired, in common with the other British Dominions, was seen when as a separate entity she was represented at the Peace Conference in Paris and her delegates signed the Treaty of Versailles.

Outside the Union the period under review was chiefly noticeable for two things: the disappearance of German sovereignty accompanied by the transfer of the administration of ex-German S.W. Africa to the Union, and the decision to terminate the government of Rhodesia by the Chartered Company, in response to the demand of Rhodesians for self-government.

Botha's First Ministry.

The Union had been brought about by the recognition by the leaders of the Dutch and British communities that S.A. was one country, not several, and that in every part of it the interests of the two races were so intermixed that they could not be separated without harm to both. Lord Gladstone, the first governor-general of the Union, had called upon Gen. Botha, the Prime Minister of the Transvaal, to form the first Ministry under the Union.[1] This Gen. Botha had done and this Ministry came into existence on May 31 1910, the day on which the Union was proclaimed (being the eighth anniversary of the close of the Anglo-Boer War). General Botha's Ministry was formed from members of the expiring Cabinets of the various colonies, but while it included Natal ministers and strong Boer partisans it was not a coalition ministry. The first general election, held on Sept. 15 1910, was fought on party lines and was hotly contested. It resulted in a majority for the "South African" party, that led by Gen. Botha, of 13 over all other parties, though Gen. Botha himself was defeated at Pretoria East by Sir Percy Fitzpatrick and a seat had to be found for him by means of a by-election. In the first session of the Union Parliament (opened by the Duke of Connaught on Nov. 4) Gen. Botha had the support not only of his own party, but of that of the four Labour members elected by Rand constituencies and of several of the Natal members of whom 13 out of 17 had been returned as Independents. The opposition, known as the Unionist party (and mainly British) was led by Dr. Jameson, who was created a baronet in Jan. 1911. Owing to ill health Jameson resigned the leadership in April 1912, and was succeeded by Sir Thomas Smartt, an ex-Cape minister and, like Jameson, a medical man. In Oct. 1912 Jameson resigned his seat for Albany (Graham's Town) and retired from Parliament.

General Botha's Cabinet was of a rather heterogeneous character. Among its members were Gen. Smuts, Mr. H. C. Hull, Mr. Jacobus Wilhelmus Sauer, Mr. Henry Burton, Mr. Abraham Fischer and Gen. Hertzog. They were divided on personal and provincial as well as progressive and retrogressive lines. General Smuts, Minister of the Interior, did not at first figure very prominently, but was the Prime Minister's right-hand man. Mr. Hull (b. 1860), after being in the Cape civil service, had practised at the bar, served in the war of 1899–1902 and was afterwards Treasurer of the Transvaal, and he entered the Union Cabinet as Minister of Finance. Mr. Sauer had been 30 years a member of the Cape House of Assembly and had frequently held office. In Gen. Botha's Cabinet he was Minister of Railways and Harbours and chairman of the Railways and Harbours Board, and thus head of the largest revenue producing department of State. Mr. Fischer and Gen. Hertzog represented the extreme element among the Boers. They were both from the Orange Free State, of which (as the Orange River Colony) Mr. Fischer had been Prime Minister. In the Union Cabinet he became Minister of Lands and Gen. Hertzog Minister of Justice.

Education Controversies.

The first session of Parliament was devoted mainly to putting the Union machinery into working order. It was not until towards the close of 1912 that Gen. Hertzog publicly abandoned the principles on which the Union had been established, though there was no doubt of his belief that the Dutch community had a prescriptive right to dominance in S. Africa. The most controversial issue considered in the 1911–2 session arose out of the Education Acts of the former Orange River Colony (*see* 20.160), where, during its brief period of self-government, Gen. Hertzog as Minister of Education had enforced bi-lingualism in the state schools. By the Act establishing the Union education "other than higher education" had been left in the control of the provincial councils for a period of five years, after which Parliament was free to take what action it pleased. In the meantime it could only advise. A select committee on which the S.A. and Unionist parties were equally represented considered the subject and on April 17 presented a majority report recommending that instruction up to Standard IV. should be given in and through the "home language," with the optional use, on the demand of parents, of the other language, and that above Standard IV. freedom of choice in the medium of instruction should be left to the parents; also that teachers should be free to qualify in either language (English or Dutch). This was a reversal of Gen. Hertzog's policy, but though he disliked this compromise it was accepted by the Union Parliament (April 24). During 1911–2 the provincial councils of the Transvaal, Free State and the Cape passed ordinances adopting the compromise, though with some modifications in favour of Dutch. This virtually ended the language controversy as far as schools were concerned, and the provincial councils taking a liberal view of their duties, their control over elementary and secondary education was continued even after the lapse of the five years provided in the Union Act. But Gen. Hertzog's position was much shaken during the controversy over the medium of instruction. The success of an action for slander (Aug. 1911) brought against him by Mr. Wm. Fraser—Free State inspector of schools whom Hertzog had dismissed in 1909—caused much scandal, which was intensified by the success (Nov. 1911) of another slander action brought against him, the second plaintiff being Dr. Ward, president of the O.F.S. medical council. The situation was rendered piquant by the fact that Hertzog was Minister of Justice. He tendered his resignation, but Gen. Botha, not wishing to alienate the Boer extremists, refused to accept it.

Having brought about a settlement of the language question in elementary schools the Union Parliament was called upon to deal with higher education. The only university in S.A. at the time of the Union was that of the Cape of Good Hope, founded in 1873, with its seat at Cape Town. It was an examining body, with affiliated colleges. Demands for teaching universities had grown up and the Union Government had to deal with an offer of £500,000, half of this sum being a bequest by Sir Julius Wernher, the other half being given by Messrs. Alfred and Otto Beit. This money it was desired should go to establish a national university on the Groote Schuur estate, near Cape Town. A bill to give effect to this proposal was introduced into Parliament in the session of 1913. It met with much criticism and was withdrawn, a strong University Commission being appointed in Nov. 1913 to enquire into the subject. Its report, issued in 1914, is a valuable document, dealing fully with the lines of possible development, though the Commission was fain to acknowledge that the many vested interests constituted an "almost insolvable" problem. It recommended two universities—one at Cape Town and one at Pretoria, to one or other of which the existing university colleges would be attached. This recommendation provoked almost as much criticism as had the bill of 1913.

---

[1] Mr. J. X. Merriman, as Prime Minister of the Cape, the oldest colony in S.A., had some claim to be called upon to form the first Union Ministry, but his claims were passed over. He declined to serve under Gen. Botha. It appears, however, from the biographies of Jan Hofmeyr and of ex-President Steyn that both Botha and Merriman were prepared to serve under Steyn. Steyn was an invalid, and his doctors forbade him to entertain the idea of taking office. The ex-President was against a coalition Ministry, among other reasons because he feared that had Dr. Jameson been in the Cabinet he would have pressed for the inclusion of Rhodesia in the Union. While Steyn had favoured the Union movement he was not prepared even in 1910 to accept its full consequences. *See* J. H. Hofmeyr's *Onze Jan.* (1913) and Van der Merwe's "Life" of Steyn (in Dutch 1921).

The Dutch community strongly opposed the proposal that Victoria College, Stellenbosch, founded in 1866 as the Stellenbosch Gymnasium and mainly attended by Dutch students, should be incorporated in the Cape university. A solution of the difficulty was reached in 1916 when Parliament passed Acts establishing three universities: the university of South Africa, the university of Cape Town, and the university of Stellenbosch. The two last were to be teaching universities and the seat of the Cape Town University was to be at Groote Schuur. It was formed by incorporating the South African College (founded at Cape Town in 1829) and to it the £500,000 of the Wernher-Beit bequests accrued.

The university of South Africa took the place of and was the legal successor of the university of the Cape of Good Hope, headquarters being removed from Cape Town to Pretoria. The new university, like its predecessor, was a federal organization with examining functions. Its first chancellor was the Duke of Connaught. The changes became effective on April 2 1918.

Defence.

In the 1911–2 session of Parliament an attempt was made to grapple with the relations of the white and Kaffir races, the position of Asiatics in the Union and with national and imperial defence. General Botha with two of his colleagues (Sir David de Villiers Graaff and Mr. F. S. Malan) had attended the Imperial Conference held in London in May and June 1911, when the Asiatic question and defence had been considered. The Union Government decided that S. A. should provide for its own internal defence, and a Defence Act was passed in June 1912, creating a citizen force at a cost of about £500,000 a year; this is in addition to a permanent force of five regiments.[1] The Act provided for the military training of 50% of the young men between 18 and 21; the other 50% being compelled to join rifle clubs and similar associations. The 50% for training are obtained in the first place by voluntary enlistment, but if sufficient numbers are not forthcoming by this method, then by ballot. (Recourse to the ballot had not been necessary up to 1922.) Members of the Citizen Force with the colours are paid. Provision was made for artillery, cavalry, infantry, engineer and transport units, uniformity with the units of the other overseas' dominions being aimed at. General C. F. Beyers, one of the Transvaal commandants in the Anglo-Boer War, was appointed commandant-general, while the Council of Defence created by the Act consisted of Gen. Schalk Burger (Transvaal), Col. (afterwards Sir) Charles Crewe (Cape), Gen. de Wet (Orange Free State), and Col. Sir Duncan Mackenzie (Natal).

Objections to the Act came chiefly from the "back-veld" Boers who entertained strong dislike to compulsory service. The force being established, the reduction of the strength of the British imperial forces in S.A. from 11,500 to about 7,000 was announced in Nov. 1912. With regard to naval policy practically no progress was made. General Botha was fully alive to its importance and sought to educate his followers on the subject in several speeches. But in 1920 the situation remained as it was in 1910. The British Admiralty continued to use Simon's Town as headquarters of the Cape and East Coast Squadron. In 1921, however, the Government adopted the principle of the formation of a S.A. navy for home defence.

The Indian Question.

The policy to be adopted with respect to Asiatics had two aspects: (1) the treatment of Asiatics already in the Union and (2) whether or not to permit further immigration. On the second question there was a determination on the part of the great majority of white S. Africans to prohibit the further entry of Asiatics alike on racial and economic grounds. They had the black man ever with them and they were determined as far as in them lay not to add another racial and disturbing factor. But there were already 150,000 Asiatics in the Union, and except for some 2,000 Chinese they were all British Indians. Of these fully four-fifths lived in Natal. They had gone thither at the invitation of that colony, where the sugar and tea plantations depended upon coolie labour. Indeed almost the only dissidents in the Union from the exclusion policy were the Natal planters. On the question of immigration the Government of India, however, took a step which eased the situation. It was a vigilant champion of the rights of Indians settled in other parts of the Empire and it had been for years dissatisfied with the treatment of the coolies in Natal. In 1908 it had decided to prohibit the further importation of indentured Indians into Natal and it was at the request of the Natal authorities that it permitted the system to continue until July 1911, when it finaly ceased. This left untouched the question of voluntary immigration, which among the coolie class was never great. The position in the various provinces of the Union differed. In the Orange Free State as a result of a rigid exclusion policy constantly enforced there was no Indian question; in the Cape province Indians enjoyed equal rights with whites—political and municipal, not only in theory but in practice. But comparatively few Indians were attracted to the Cape and in that province the question was not acute. The Cape Immigration Acts of 1902 and 1906 sufficiently guarded the province from the influx of undesirable elements. In Natal the matter was much more pressing. There the Indians considerably outnumbered the whites and besides the coolie class included many Bombay Mohammedans (often misnamed "Arabs" in S.A.), keen and enterprising traders. Measures restrictive of Indian enterprise had been passed by Natal and in that province they had no political rights. They however possessed the municipal franchise and, as in the Cape province, had unrestricted rights to own and occupy land. In the Transvaal the Indians had neither political nor municipal rights nor were they allowed to own land, save in specially assigned locations. The Indians in that province were mainly Moslem traders, who had found a favourable field for their activities in the development of the country which followed the discovery of the Rand gold mines. For years the Indians in the Transvaal had been subjected to many restrictions; it was in this province that feeling against them was most bitter and the agitation against them most strong. The position held by white S. Africans was plainly stated by Gen. Smuts at the Imperial Conference of 1917. What he then said was strictly applicable to the situation in 1911 when the Union Parliament first took up the subject.

> In S.A. there has been this fundamental trouble [he said], that the white community has been afraid of opening the door too wide to Indian immigration. We are not a homogeneous population. We are a white minority on a black continent, and the settlers in S.A. have for many years been actuated by the fear that to open the door to another non-white race would make the position of the few whites in S.A. very dangerous indeed. It is because of that fear . . . that they have adopted an attitude which sometimes has assumed the outward form, although not the reality, of intolerance.

Save that among many of the whites in the Transvaal the outward form of intolerance was also its reality, this was a fair statement of the position of white S. Africans. They feared, or a considerable proportion of them feared, being swamped by Asiatics, and, especially in the Transvaal, they greatly feared Indian competition in trade. On its part the Government of India, when the Union began legislating on the subject was ready to acquiesce in an exclusion policy, but sought in return to secure fair treatment for the Indians already in the Union. And by "fair treatment" the Government of India meant in the long run political and municipal rights—weapons by which the Indians would have effective means of self-protection. In 1911 and again in 1912 Immigration Restriction bills were introduced into the Union Parliament, but the bills were dropped, a wider measure being announced for 1913. In Oct. 1912 Mr. G. K. Gokhale, one of the most influential of Indian politicians, visited S.A. on "a mission of peace" and in Nov. went to Pretoria as the guest of the Union Government to confer with them on the forthcoming legislation. Mr. Gokhale's object was primarily to secure concessions for the Indians already in S. Africa. This was also the main object of Mr. M. K. Gandhi, who had first gone to S.A. in 1893 to conduct a law suit, but had stayed there and become the leader of the Indians in Natal and the Transvaal.

In June 1913 the Union Parliament passed an Immigrants Regulation Act, the chief purpose of which was to prevent the further entry of Asiatics into the Union. This was done not *eo nomine* but by ministerial certificate. Wives and young children of domiciled residents were allowed to enter, and also registered Indians who might be temporarily absent from S. Africa. The Act further restricted Asiatics to the province in which they were resident. This restriction of movement, and the poll tax of £3 levied on all ex-indentured Indians in Natal—a tax unequal and uncertain in its incidence—caused great dissatisfaction among the Indian community. Under Mr. Gandhi's leadership (Mr. Gokhale had returned to India) they adopted an attitude of passive resistance, but this was succeeded by strikes at Durban and at the collieries and plantations. Then, to assert the right of Indians to move from one province to another, Mr. Gandhi put himself at the head of some 2,700 Indians who started to march past Majuba to Johannesburg. About 500 were stopped at the Natal border, the rest got some distance into the Transvaal before they were turned back. Mr. Gandhi was arrested and convicted on several charges, *e.g.* he was sentenced to nine months' imprisonment for abetting a strike of coal miners. But the situation could not be met simply by repressive measures. An Indian Inquiry Commission was appointed and, on its recommendation, the Natal poll tax was abandoned and certain concessions made as affecting the recognition of Indian marriages. These changes were made operative by the Indian Relief Act, 1914. More important was the so-called Smuts-Gandhi agreement of the same year. General Smuts as Minister of the Interior was in charge of the legislation affecting Indians, and, seeking a statesmanlike solution of the difficulty, he approached Mr. Gandhi. The negotiations succeeded and the arrangement reached was set forth in letters exchanged between Mr. Gorges (then secretary to the Ministry of the Interior) on behalf of Gen. Smuts, and Mr. Gandhi and dated June 30 1914. The essence of the agreement was the assurance by Gen. Smuts that existing laws would be administered "in a just manner and with due regard to vested rights." This was at the time interpreted by the Indians, by the Government of India and by many of the whites in S.A. to mean that the rights which Indians were entitled to exercise under the laws as existing in 1914 could not be restricted by fresh legislation. Mr. Gandhi, conceiving his mission in Africa ended, returned shortly afterwards to India.

---

[1] Only persons of European descent were allowed to become members of the Defence Force.

It is convenient here to summarize later developments of the Indian question before turning to the main stream of S.A. history. Mr. Gandhi in a farewell letter, published in the *Rand Daily Mail* of July 20 1914, had assured the Indians that the settlement then reached did not preclude them from fresh agitation for the removal of other disabilities: for their part a large section of the whites agitated for further restrictions upon Indian activity. Friction inevitably arose, but during the World War untoward incidents were avoided. A definite settlement of the immigration question was reached at the Imperial Conference of 1918 when a reciprocity resolution was accepted which declared it to be "an inherent function of the governments of the several communities of the British Commonwealth, including India, that each should enjoy complete control of the composition of its own population by means of restriction on immigration from any of the other communities." In accepting this resolution on behalf of the Union Mr. Burton declared, justly, that S. Africans had found the Indians "good, law-abiding, quiet citizens" and that it was the duty of the Government to see that they were treated "as human beings, with feelings like our own, and in a proper manner."

What was the "proper manner" was still a point of contention. After the Smuts-Gandhi agreement Indians applied for and obtained new licences to trade, and in the Transvaal formed private companies with limited liability for the purpose of acquiring land and fixed property—the Transvaal law of 1885 which prohibited individual Indians from acquiring land not applying to corporate bodies. This action by the Indians was denounced by the white community in the Transvaal as a flagrant violation of the Smuts-Gandhi compact, to which the Indians replied that it was one of their vested rights and that such companies had been formed before the agreement was made. There were in fact three such companies in 1913; by March 1919 the number registered had grown to 370, with a total capital of £479,000. Early in 1919 the Krugersdorp municipal council brought the matter to an issue, nominally on the trading question, by obtaining an interdict from the Supreme Court at Pretoria, prohibiting Indians from occupying a certain trading "stand" in the town. This led to the appointment of a parliamentary select committee. As the result of its investigations an Act (No. 37 of 1919) was passed by the Union Parliament which, while confirming the right of Indians to the occupation of land for trading purposes which they then held, prevented the further acquisition of land by Indians through private companies.

The Act of 1919 pleased neither party. It was noteworthy that in the Transvaal, where numerically the Indians were few, feeling against them was much stronger than in Natal, with its large Indian population. The explanation was to be found in the fact that whereas in the Transvaal nearly all the Indians were traders—many of them merchants owning large businesses and formidable competitors with white traders—in Natal the great bulk of the Indians were Madrassi of the agricultural and labouring classes, and save in fruit and vegetables did not enter largely into trade. Moreover, large numbers of the Indians in Natal were S.A. born and could hardly speak any Indian language. The agitation in the Transvaal against the "Asiatic menace" led in Feb. 1920 to the appointment of the Asiatic Inquiry Commission specifically charged to consider the question of trading rights and land ownership by Indians. The sittings of the Commission were held in public, the Government of India being represented throughout by Sir Benjamin Robertson, a man with unrivalled knowledge of the history and facts relating to Indians in S. Africa. The Commission issued an interim report in May 1920 recommending that steps be taken to aid the repatriation of as many Indians as desired to leave the country, and some few thousands did return to India. The final report of the Commission was issued in March 1921. The chairman was Sir J. H. Lange, a judge of the Supreme Court, and all the commissioners were men of experience, animated with the wish to do justice. Their inquiry had the merit of bringing out the facts and dispelling the belief that the Transvaal was menaced, numerically, by an Asiatic invasion. They also made clear the fatuity of the proposals put before them for the compulsory expropriation of the whole Indian population, or of "squeezing them out" by multiplying restrictions on their activities. Their recommendations were however significant of the strength of white feeling on the subject. They proposed alterations in the law which would secure Indians from being refused trading licences arbitrarily or on the ground of race; they opposed compulsory segregation, but advocated a system of voluntary separation by "attraction" to desirable residential and trading areas. They opposed the repeal of the Act of 1919 and went further by proposing that in Natal the right of Asiatics "to own land for farming or agricultural purposes should be confined to the coast belt, say 20 to 30 m. inland." On this last point Mr. Duncan Baxter, one of the four commissioners, dissented, describing it as retrograde and a breach of the conditions of recruitment. The Government of India also at once lodged a protest against this recommendation, holding that it was not only a breach of the conditions under which Indians were recruited but also a breach of the Smuts-Gandhi agreement. The Union Government took no action on the Commission's report in the 1921 session of Parliament, but Mr. Patrick Duncan, who had become Minister of the Interior, indicated his sympathy with a proposal to allocate separate and distinct areas for occupation by the Indians of Natal.

The Government of India, while still seeking the removal of particular grievances, adhered to its wider view that only by the grant of equal rights could Indians in the Dominions be fully protected. At the Imperial Conference held in June–Aug. 1921 the Indian delegates pressed for the recognition of this principle and it was accepted by the representatives of Canada, Australia and New Zealand. But the S.A. delegates, of whom the chief were Gen. Smuts and Sir Thos. Smartt, declined to subscribe to the resolution which declared that it was desirable that "the rights to citizenship" of Indians lawfully domiciled in other parts of the Empire "should be recognized." They regretted "their inability to accept this resolution in view of the exceptional circumstances of the greater part of the Union." Direct negotiations between the Governments of India and of S.A. to reach a more satisfactory position were not precluded. That the Union delegates rightly interpreted the feeling of most white South Africans was shown by an ordinance passed at this time by the Natal provincial council to prevent any Indians in the province acquiring in future the municipal franchise. This ordinance was disallowed by the Union Government. At the Cape at the same time an Indian, Dr. Abdurrahman, a well-known member of the Cape Town municipality, was also a member of the provincial council.

The Natives and the White Races.

The first step taken by the Union Government in regard to the relations between the white and native races was the decision that the control of all regulations made by local authorities affecting natives should be exercised not by the provincial councils but by the Government through the Native Affairs Department, a decision tending towards a much-needed uniformity of policy. While the Government were considering what principles should guide their action public attention in 1911–2 was chiefly focussed on one aspect of the question, assaults by Kaffirs on white women. On the Rand in the first half of 1911 three Kaffirs were shot by white women whom they had attempted to assault. This shooting followed the commutation, in Jan. 1911, by the High Commissioner (Lord Gladstone) of a death sentence on a Rhodesian native convicted of an attempt to assault a white woman. This action roused much indignation against the High Commissioner who, however, met his critics fairly and won their respect. But feeling was intensified by the acquittal in Aug. 1911, by a Rhodesian jury, of a white man who had shot dead a Kaffir. (This led to the making of a special jury list for the trial of such cases, the ordinary jury not being trusted to administer impartial justice.) In all during the year ending March 31 1912, there was in the Union alone (*i.e.* Rhodesia excluded) 85 cases of outrages upon Europeans by natives, as compared with 69 during 1910. On the Rand the evil was attributed in part to illicit liquor selling and in part to the fact that the mine labourers were without their women-folk, and a petition signed by 52,000 Rand residents (presented to Parliament May 1912) asked *inter alia* for the provision of compounds in which natives should be permitted to keep their wives, as well as for facilities for training native female servants and for the importation of European domestics.

A commission, appointed in June 1912 on the motion of Sir Thomas Smartt, enquired into the prevalence of sexual assaults, and the extent to which they were attributable to economic and social factors. This commission was presided over by Mr. Melius de Villiers, ex-chief justice of the Free State and included four ladies, one from each province. On its report remedial measures were taken, such as provision for wives in the compounds. It was shown that one cause of the evil was the undue familiarity with which many white women treated male natives employed by them as domestic servants. The measures taken had a good effect, and assaults of the character stated became fewer.

On the larger question as to the place which the Bantu should hold in the community there was much heart searching. There was on the part of the whites agreement on one point only—the dependence of agriculture and industry on the manual labour of the native. The situation was complicated by the fact that the whites had not only the native to deal with but a very large number of coloured persons with a greater or less proportion of white blood—the well-known "Cape Boys." These people not only competed with the whites in skilled labour, but a good many of them had entered the professions as lawyers, doctors, journalists, land surveyors, etc. The pure African was following their example, and both the coloured and native peoples were learning the power of coöperation. They had their own newspapers, their own political and trade organizations, and were quick to learn from the methods of the whites. Especially powerful was the influence of education and Christian missions. Many natives made great sacrifices to obtain education. For educational facilities they had to rely chiefly upon the missionary societies. The provincial councils were not generous in their expenditure in this respect though the total expended on native education rose from £81,000 in 1913 to £137,000 in 1918. More than half the total sum was spent by the Cape province. In regard to higher education the Union Government took a somewhat more liberal attitude and gave its support to the South African Native College at Fort Hare.

The desire of the natives, or the more vocal section of the natives, to escape from European tutelage was seen in a growing inclination, particularly in the Transkeian territories, to secularize education and to obtain a larger share in its management. This desire for "self-determination" was also seen in the setting up of many churches independent of European control, a movement fostered by intercourse with the negro churches of the United States. Of these native separatist churches perhaps the most influential was the "Ethiopian Church of South Africa." Their leaders joined in the demands of the "Native National Congress," an organization claiming to represent the Bantu peoples of S.A., in demanding redress of grievances and in especial the removal of the colour bar which existed in all the provinces except the Cape. A deputation from this body came to England in 1919 "not to demand independence, but admission into British citizenship."

Such were the aspirations of educated men among the coloured and native races; the more extreme, among whom communist doctrines had gained a hold, raised the cry of "Africa for the Africans." The loyalty of the natives and the valuable services they rendered during the World War went to show that the extremists were not an immediate danger. But the natives also during the war got a new idea of their power. Bantus in Rhodesia, the "Cape Boys" from the Union served as combatants in the E.A. campaign—and they saw that the heaviest fighting there fell to black troops. A new situation had arisen, one of the most noteworthy being the development of a race, as distinct from tribal, consciousness.

The problem as it presented itself to the Union Government was how best to secure the future for the white race in S.A., surrounded as it was by a black population five or six times its numbers. The Government would have had to face the bitterest hostility of the Dutch community, and of a considerable section of the British in Natal and the Transvaal had they attempted to remove the colour-bar in those provinces or in the Free State; had the Boers had their way the colour-bar would have been set up in the Cape province. Gen. Botha did not subscribe to the principle of Cecil Rhodes—"equal rights for all civilized men." Yet he and his colleagues acknowledged that it was the duty of the State to help forward the native on the path of efficiency and civilization, in opposition to the standpoint of the extreme Dutch Nationalists that there was no room for the advancement of the native save at the expense of the white man. The point of view of the Government was that the natives should be aided in such a manner that they should not come into competition with the whites. The proposal which attracted most support was to keep blacks and whites in separate areas, while still employing natives for labour on white enterprises. The plan was feasible; it was for example being worked in Basutoland under the Colonial Office. In that territory white settlement was forbidden, but thousands of Basutos went on contract to the gold-mines or to farms in the Free State. And there were already native areas in the Cape, such as the Transkei, where, under white officials, the natives possessed some share in the administration. It was in this direction Gen. Botha looked for a solution of the problem. In a speech in Parliament (May 9 1912) he stated that "the time was coming when the native question would have to be considered most seriously in the direction of keeping whites and natives apart and preventing their intermingling. They would have to fix attention closely on the question of segregation, while treating everyone with absolute justice." The segregation plan received the support, among many others, of Sir Matthew Nathan, an ex-governor of Natal, and Gen. Hertzog. But it was opposed by those who, like Mr. P. W. Schreiner and Mr. Patrick Duncan (a leading member of the Unionist party), regarded it as both wrong and impolitic to put hindrances in the way of the advancement of the natives in civilization and industrial efficiency. Mr. Duncan in a striking pamphlet published in Oct. 1912 ("Suggestions for a Native Policy") admitted the dangers foreseen by the segregationists, but believed the remedy to be in European immigration on a large scale. "Nothing else," he declared, "will save S.A. for the European race." But to immigration on a large scale the Dutch community was definitely opposed, and it was not till 1920 that the Government made any strenuous effort to attract white settlers to the country.

A motion brought forward at the Unionist Congress in Johannesburg (Nov. 21 1912) to commit the party to the policy of segregation was defeated, the previous question being carried by 91 votes to 7. Opinion being so divided the Union Government found great difficulty in shaping its native policy. As a temporary measure a Native Land Act was passed in 1913 which prohibited the further acquisition of land by natives or from natives—an Act which led to vehement protests from native associations and leaders of native thought, while a legal decision was obtained that the provision of the Act did not apply to the Cape province. The Act had set up a commission, under the chairmanship of Sir William Beaumont, which had for its object the ascertainment of what land areas should be allocated to natives and those from which they should be excluded. The commission reported in 1916 and a Native Affairs Administration bill was introduced in 1917, chiefly as a means of ascertaining public opinion, native as well as white. It embodied the principle of separate areas in rural districts. After exhaustive consideration Parliament in 1920 passed a Native Affairs Act which was in effect a half-way segregation measure. The Act, for which Gen. Smuts was largely responsible, was based on the principle that the white man is the permanent and predominant factor in the civilization and government of S. Africa. But it was not repressive to the black man. It set aside areas for the exclusive occupation of the natives in which they would have greater opportunities than before for obtaining local self-government, it opened the way to a system of representative native congresses which would express authoritatively native opinion on intended legislation, and it held out the prospect of the development of native institutions parallel to but separate from those of the whites. In short Gen. Smuts, the great advocate for the union of the two European races in S.A., was equally earnest in his efforts to keep the streams of white and (nascent) black civilization apart. A feature of the Act of 1920 was the establishment of a permanent Native Affairs Commission to deal with the position of natives in urban areas, education and the Pass Law system, in all of which matters it was admitted that the natives had not received fair treatment. The Act was regarded by the white community—Dutch extremists apart—as a piece of constructive statesmanship, and its policy received the approval of the most responsible leaders of the natives. But danger lay in the inflammable language and actions of less responsible, and less educated agitators, working on the mass of their fellows, scarcely emerged from barbarism, and in the equally pernicious utterances of the white extremists. Events in 1920–1 showed the peril attendant on any mishandling of the native question.

Trade and Tariffs.

The promotion of trade and agriculture occupied much of the energies of the people and Government. A prolonged drought—lasting from Oct. 1911 to Nov. 1912—the most severe experienced in S.A. since 1862, affected chiefly Natal, the Transvaal and the Transkei. The severe losses sustained forced attention to the need of more scientific farming and to irrigation works, upon which the Government expended £500,000 in 1912. In 1919 there was another very serious drought involving the country in an expenditure of £16,000,000. This led to the appointment of a commission in 1920 to enquire into drought, soil erosion and other allied problems. One result was to emphasize the need of water storage in connexion with irrigation. In Oct. 1912 a State Land and Agricultural Bank began operations in the Union, and a similar institution was established in Rhodesia.

Much diversity of view existed as to the tariff policy of the Union. Early in 1912 a commission, of which Sir T. M. Cullinan was chairman, appointed to enquire into the conditions of trade and industries reported in favour of increased duties on wheat, flour, sugar, tea, clothing and furniture, declaring that it was "not only necessary that a policy of protection should be adopted, but that there should be continuity of policy." Two influential members presented minority reports in favour of the "open-door." Rhodesian feeling was in favour of a lower tariff, and it was suggested that Rhodesia might withdraw from the Customs Union rather than bear greater fiscal burdens. At Johannesburg on Nov. 19 1912 Sir Thomas Smartt declared that a plank in the Unionist party's platform was a tariff primarily for revenue purposes, combined with a policy for the encouragement of industries for the general benefit and the extension of the existing imperial preference. This was, in the main, the solution adopted. Tariffs and rebates were fixed by various Acts of Parliament passed between 1914 and 1919, designed to afford relief to home manufactures, the majority newly established. An Industries Advisory Board was set up in Oct. 1916, consisting for the most part of business men, and early in 1917 a Scientific and Technical Committee was instituted. There followed in 1921 the creation of a Board of Trade and Industries, and a definite policy of industrial development was undertaken by the Government. But Mr. F. S. Malan, Minister of Mines (and then acting Prime Minister) addressing the convention of the Federated Chamber of Industries at Port Elizabeth (July 25 1921) declared that the Government had no intention of "going in for an out-and-out protective policy." And Col. Reitz (Minister of Lands) told the sugar planters of Zululand that "the consumer must be protected. Higher tariffs would mean dearer prices."

One great department of state, the Railways and Harbour Board, was required by the Act of Union to be run with due regard to agricultural and industrial development and not as a producer of revenue for extraneous purposes. The Board built needed railway lines and undertook harbour works, though nothing material was done to enlarge the docks at Table Bay, a matter which provoked strong protests from the citizens of Cape Town. Mr. Sauer, the minister in charge of the department—whose budget was separate from that of the general budget of the Union—took an independent view of his duties and as early as July 1911 differences arose between him and his colleagues, especially with Mr. Hull, the Finance Minister. Mr. Hull had also to meet the attacks of Mr. Merriman, the most accomplished parliamentarian and ablest financier in the House of Assembly and a very candid friend of the Ministry. Mr. Merriman denounced the Government's financial proposals as predatory and extravagant, while Mr. Hull alleged that railway expenditure was incurred without Treasury sanction—that there had been a tendency to regard the railway and harbour administration as something for which the Government had no collective responsibility. General Botha admitted that the Cabinet had not been sufficiently consulted in railway matters and on May 18 1912 Mr. Hull resigned. A reconstruction of the Ministry was postponed until after the close of the parliamentary session (June 24), when the chief changes made were the appointment of Mr. Henry Burton (an ex-Cape minister), to the Ministry of Railway and Harbours, while Mr. Sauer became Minister of Agriculture, an office which Gen. Botha had combined with the premiership.

The Two Streams Policy.

The differences between Mr. Hull and Mr. Sauer were shortly afterwards forgotten in consequence of the attitude taken up by Gen. Hertzog, who now began publicly to assail the principles upon which the Union had been established. To what extent Hertzog was supported or restrained by ex-President Steyn is uncertain; but Steyn, whose opinion would have been decisive with a large section of the Dutch community, did nothing publicly to counteract the rekindling of the fires of racial bitterness. The by-election campaign at Albany, caused by the resignation of Sir Starr Jameson, brought about a crisis. General Botha, and with him Gen. Smuts and the majority of the Dutch members of the Cabinet, had definitely accepted the British connexion, and the position of S.A. as a self-governing member of an Imperial Commonwealth, with corresponding responsibilities, and, knowing that peace between the two white races was essential to the prosperity of the country, he was an ardent advocate of the closest coöperation between them. On both these points Hertzog was violently opposed to his colleagues. His motto "South Africa first" meant in fact Dutch supremacy. In a speech at Nylstroom (Oct. 1912) he characterized Sir Thomas Smartt (who had succeeded Jameson as leader of the Unionist party) and other prominent members of the Opposition as "undesirable political foreign adventurers," and at Rustenburg, on Dec. 8, he declared that imperialism appealed to him only when it was useful to S. Africa. He had a short time previously pronounced in favour of the Dutch and British in S.A. remaining "two nationalities flowing each in a separate channel." General Botha though he publicly dissented from Gen. Hertzog's views was desirous if possible to avoid an open breach, but after the Rustenburg speech action was unavoidable. On Dec. 12 Col. Leuchers, Minister of Public Works and a Natal member of Parliament, resigned as a protest against Hertzog's "anti-British and anti-imperial sentiments." Botha then intimated to Hertzog that his resignation would be acceptable, but Hertzog refused to move. Botha met this difficulty by tendering his own resignation, Dec. 15, and was at once asked by the governor-general (Lord Gladstone) to form a new Ministry. This he had accomplished by Dec. 20, the new Cabinet being composed of the same members as the old except for the omission of Gen. Hertzog and Col. Leuchers (the latter replaced by Sir Thos. Watt, another Natal member). The death of two ministers—Mr. Sauer and Mr. Fischer—during 1913 necessitated a further remodelling of the Cabinet. Mr. N. J. de Wet became Minister of Justice and Mr. H. C. Van Heerden Minister of Agriculture.[1]

The cleavage in the ranks of the ministerialists (the S.A. party) became complete in 1913. It was soon apparent that the appeal to Dutch racialism had considerable support, notably in the O.F.S., and some 10 or 12 members of the House of Assembly elected as supporters of Gen. Botha turned to Hertzog as their leader. At the party conference opened at Cape Town on Nov. 30 Gen. de Wet nominated ex-President Steyn as "leader of the party outside Parliament, with power to nominate the Prime Minister." On this proposal being defeated the malcontents left the conference in a body and in Jan. 1914 a new party under Hertzog's leadership was formed. It took the title of the Nationalist party.

Rand Labor Riots.

The year 1913 and the opening months of 1914 were, however, as notable for labour unrest as for political differences. The disturbances in Natal due to the opposition of the Indians to the Asiatic legislation of the Union have already been recorded. They caused no such trouble as attended disturbances on the Rand, which began with a strike of the white miners at the New Kleinfontein mine in May 1913. The strike was nominally on the question of hours, but it was symptomatic of a determination of Labour to gain greater control over industrial conditions. There was, too, a revolutionary wing to the movement, and the extremists seemed likely to carry with them the mass of the men.[2] The two antagonistic views were afterwards sharply put by Gen. Smuts and Mr. Creswell, the latter the leader of the parliamentary Labour party. Smuts declared the movement to have been "a conspiracy against constituted order." Mr. Creswell declared that there was "a conspiracy (of the Govt.) with capitalists to run the country in their own interests." Neither view gave a satisfactory explanation of the facts. The strike extended, negotiations for a settlement failed, feeling ran high and by the end of June the Government had drafted 2,000 troops into the Benoni district, the centre of unrest, and some 20 m. E. of Johannesburg. The leaders of the strike had chosen a time when the Union was without a regular armed force of its own. The citizen army provided by the Act of 1912 was not yet formed, while the militia and volunteers had been disbanded as from July 1, and the permanent force—the S.A. Mounted Riflemen—provided for in the Act of 1912, had only begun training in April (1913). British regulars were therefore drafted into Johannesburg, where serious rioting followed a demonstration by the men in Market Sq. (July 4). The strikers seized the electric power station, and during a night of terror burned down the Park railway station and the offices of the *Star* newspaper. Several persons were killed and many injured in conflicts with the police and military. The next morning Gens. Botha and Smuts intervened and opened negotiations with the strikers. While these were going on dynamite explosions occurred and the mob attacked the Rand club. The negotiators succeeded in reaching agreement and at night the strike was declared "off", one condition being the reinstatement of the men at the New Kleinfontein mine. But it was difficult to appease the mob and there was further rioting on July 6. In all some 20 persons were killed and 250 injured. A grave element of danger was the excited condition of the native labourers on the Rand mines and it was in part consideration of what they might do if the riots continued that drew the authorities and the strike leaders together. The situation continued anxious, as extremists were calling for a new and general strike. But on July 31 the executive of the Federation of Trades decided by 65 votes against 18 not to call a general strike. An official inquiry into labour conditions was then instituted, but in Jan. 1914 new trouble arose. A policy of retrenchment on the railways was resented by the men and a general strike proclaimed for Jan. 14. It was, according to the official view, an attempt by the Trades' Federation to control the railway administration. The Government acted promptly (Gen. Smuts was at the time both Minister of Defence and Minister of the Interior). Martial law was proclaimed and 20,000 troops mobilized and concentrated on the Rand. Ten prominent Labour leaders—not including Mr. Creswell—were arrested and secretly deported, illegal action for which the Government subsequently obtained an Act of indemnity. In Parliament Gen. Smuts justified his action on the ground stated, namely that the leaders of the men were engaged in a revolutionary conspiracy. The action of the Government had, in any case, prevented a renewal of the rioting of 1913 though a large number of outrages occurred. Ameliorative measures were then tried and during 1914 an Industrial Disputes Act was passed. It set up machinery intended to render easier the settlement of disputes and this Act was followed in subsequent years by other measures—such as the Factory Act of 1918—designed to improve labour conditions.

In 1914 Lord Gladstone's term of office as Governor-General and High Commissioner expired and he returned to England shortly before the outbreak of the World War. His successor was Mr. Sydney Buxton, who on his appointment was created a viscount. Lord Buxton assumed office in Sept. 1914.

Effect of World War.

The outbreak of the World War tested S.A. in a manner in which no other British Dominion was tested. Twelve years only had passed since the Boers had been in arms against Great Britain, they had long and bitter memories and all the ties of kinship, affection, a common tongue and a common heritage which powerfully influenced the British in S.A. were in them lacking. The spirit of racialism had revived, and a large number of the Dutch were led to believe that the war was no concern of theirs and that S.A. should remain neutral. A smaller section actively sympathized with Germany and a few prominent Boers had entered into relations with the Germans in S.W. Africa. The German Government counted with some confidence that S.A. would stand aloof from the contest. It was misled. The attitude of Gen. Botha and of his colleagues was never in doubt. Botha, Smuts and the other Dutch members of the Government represented all those Boers who were not only faithful to the new allegiance they had solemnly recognized in 1902, but who were sincerely convinced that by the subsequent grant of responsible government to the ex-Dutch republics and the establishment of the Union, S. Africa's interest, as a self-governing dominion, was to stand side by side with the other members of the British Commonwealth.

---

[1] The year 1913 witnessed the death of other prominent S. Africans:—Sir Gordon Sprigg, four times Prime Minister of Cape Colony, Sir Richard Solomon, High Commissioner in London of the Union, and Dinizulu, the son of Cetywayo. Sir Walter Hely-Hutchinson, formerly Governor of Natal and of Cape Colony, also died in 1913. Sir R. Solomon was succeeded as High Commissioner by Mr. W. P. Schreiner, who died in 1919. Sir Edgar Walton was appointed High Commissioner in 1921.

[2] The white employees in the mines were almost equally divided between those born in S.A. and those born in the United Kingdom. The foreign born were scarcely 5%.

Rebellion of 1914.

The test as to the part S.A. would play in the World War soon came. On Aug. 7 1914, the Imperial Government telegraphed to the Union Government that "if they desired and felt themselves able" to do so, the seizure of such parts of German S.W. Africa as would give them the command of Lüderitzbucht, Swakopmund and the wireless stations there, would be "a great and urgent imperial service." And two days later the British Cabinet suggested that another expedition might be sent later to Windhuk, where there was a long-distance wireless station. On Aug. 10 Gen. Botha replied that he and his colleagues cordially agreed to coöperate with the Imperial Government and that the military operations indicated would be undertaken by the Union Government. General Botha had already intimated—on the day that war was declared—that the country would undertake its own defence, thus setting free for duty elsewhere the imperial garrison in S. Africa. It was not however until Sept. that Gen. Botha publicly announced the intention of the Government to send an expedition against German S.W. Africa, though this intention was communicated to Gen. Beyers on Aug. 13 and discussed at a meeting of the principal officers of the defence force held on Aug. 21. On that occasion Beyers expressed approval of the measures proposed. While their intentions in regard to S.W. Africa were meanwhile regarded as confidential, the fact that the Government had ranged itself on the side of Britain had been known from the first day of the war and had greatly excited the Dutch Nationalists. Some of them saw in it the opportunity they had eagerly awaited of regaining the independence of the Boer republics; some were already aiding the Germans in S.W. Africa. The decision of the Government to take the offensive against the Germans precipitated, but was not the originating cause of, the rebellion. German secret agents, too, had been busy, but their intrigues at most only served to fan smouldering fires of revolt. Botha submitted the resolution authorizing an expedition to German S.W. Africa at a session of Parliament on Sept. 9. It was bitterly denounced by Hertzog and his followers, who declared that the Union should remain neutral, but it passed the House of Assembly by a large majority on Sept. 10 and by the 14th had received the approval of the Senate. On Sept. 15 Gen. Beyers made clear his true attitude. He resigned his post of commandant-general of the Union Forces, affirming that "by far the great majority of the Dutch-speaking people of the Union" disapproved the expedition against German S.W. Africa. Botha's reply was that he himself would take command of the Union forces and personally command the operations against the Germans. On Oct. 9 Lt.-Col. Solomon G. Maritz, the commander of the Union forces—about 1,600 men—on the German frontier, was in open rebellion; on Oct. 23 de Wet was in rebellion in the Free State, the next day Beyers and Maj. J. Kemp were in rebellion in the Transvaal. The movement was concerted, though the plans for concerted action failed. Of the four rebel leaders named, Maritz was the least important and the only one proved to have been in treasonable relations with the Germans before the World War began. The evidence against Beyers of collusion with the Germans through Maritz after the war had started was conclusive, but there is no evidence that he rose in revolt out of sympathy with them. As one of their ablest leaders in the Anglo-Boer War he enjoyed a great reputation with the Transvaal Boers. Kemp also was known to them as an efficient soldier who had been one of De La Rey's chief lieutenants in the Anglo-Boer War. Kemp was now an officer of the Defence Force. De Wet was the most famous fighting general of the Free State Boers. All the men named desired to translate into action the policy which Hertzog advocated, and which they believed Steyn approved. In the opinion of a judicial commission[1] which later enquired into the rebellion (whose report was issued in Dec. 1916) Gen. De La Rey plotted a rising as soon as the war broke out. The chief aim was to restore the Dutch republics—if not to establish a completely independent S.A. Republic. At the time it looked as if De La Rey was being dragged into rebellion by Beyers and Kemp. It is certain that they depended upon De La Rey to give the word to the Transvaal burghers to rise. Whether or not through infirmity of purpose when De La Rey was brought to Treurfontein (Aug. 15) to address a meeting of burghers which had been called, in his name, with the intention of immediately starting a revolt instead of the expected words he advised his hearers to remain calm and wait events. De La Rey two days previously had been called to Pretoria by Botha and there had had a prolonged interview with Botha and Smuts who had exhorted him to use his unrivalled influence in the western Transvaal in the interest of peace.[2] And without question the burghers, though mystified, obeyed De La Rey and dispersed quietly to their homes. Then came the public announcement of the expedition against German S.W. Africa and De La Rey went to Cape Town to attend the session of Parliament, of which he was a senator. Meanwhile the Citizen Force of the western Transvaal was gathered at Potchefstroom and Beyers and Kemp arranged with De La Rey that he should return N. and address the burghers in camp on Sept. 15. On the evening of that day, at Pretoria, Beyers announced his resignation. In the morning of the same day he had received a messenger from Maritz who brought word that "all was ready" on the border. De La Rey had reached Johannesburg from the Cape; Maritz's messenger was sent by Beyers to bring him to Pretoria and late in the evening the three set out to go by motor to Potchefstroom. The revolt was to be started the next morning. The way led through Johannesburg and the car was ordered to stop by armed police, who were looking out for a gang of criminals who had escaped in a motor. Beyer's driver disregarded the summons to stop and drove on. The police patrol fired and De La Rey was shot dead. The dramatic death of De La Rey disorganized the conspirators' plans. It deprived them of the one man who could have raised the whole of the western Transvaal against Botha and the one man whose military talents might have matched those of Botha and Smuts. It accounted for the delay in the rebellion, for the interim protestations of loyalty made by Beyers and de Wet's declaration that he wanted to act constitutionally. In de Wet's case there was no evidence that he had been mixed up with Maritz's intrigues with the Germans until after the World War had begun; his was pure discontent with the existing regime.

An illuminating light on the mentality of the rebels was the profound belief that many of them entertained for the "visions" of a certain Nicholas Van Rensburg, a farmer of Lichtenburg, who had served in the Anglo-Boer War under De La Rey, at which time his reputation as a seer was established. Van Rensburg's sincerity was doubted by few—and he seldom professed to understand his own visions, which were of a true Delphic character. One of them was held to foretell the struggle in Europe and to indicate the victory of Germany "the grey bull" which defeated a red bull (England) in bloody combat. Another concerned Gen. De La Rey and with this vision was associated the number 15, which Van Rensburg beheld on a dark cloud from which issued blood. This man's visions and the faith they inspired among the burghers—and in none more strongly than in De La Rey himself—were cleverly worked upon by the conspirators—it was because of the visions that the Aug. and Sept. meetings were called for the 15th of the month. But the rebellion rested on more solid foundations than visions. As has been stated the moving cause was the desire of the Boers to regain independence, while support for the rebellion was largely gained by the assertions of Beyers and others that there would be no fighting and that Botha was secretly on their side.

---

[1] Composed of three judges of the Supreme Court, namely J. H. Lange (chairman), M. W. Searle, and F. A. Hutton.

[2] From Gen. Botha's account of the conversation De La Rey appears to have been in a distracted frame of mind. That he wished S. A. to break away from the British Empire and proclaim its independence is beyond question, and he saw in the World War an opportunity to achieve this object. He was very much under the influence of the "prophet" Van Rensburg (see later). By several observers of his conduct at this time De La Rey was believed to be mentally deranged.

The Appeal to Mr. Steyn.

News of Maritz's open revolt reached Beyers and Kemp on Oct. 12; two days later de Wet was in conference with Beyers at Pretoria and final plans prepared. But Maritz was crushed before the others could take effective action. General Smuts, as Minister of Defence, had taken over the full direction of affairs from headquarters. Colonel Coen Brits was sent to deal with the traitor and did so effectively; in an engagement at Kakamas on Oct. 24 Maritz's force was broken into small and fugitive bands and he himself compelled to take refuge over the German border. Meanwhile both Botha and Smuts were urgent in their efforts to prevent bloodshed in the Free State and the Transvaal. They turned to ex-President Steyn as the one man whose word could deter the rebels from executing their purpose. On Oct. 11 Botha telegraphed to Steyn—who, in poor health, was living at his farm Onze Rust, near Bloemfontein—informing him of the treason of Maritz, and saying "A word from you will go far." Steyn refused to speak the word. Not that he approved the action of Maritz, but because "I shall have to tell the people that I most strongly disapprove of the policy of the Government respecting an attack upon German W. Africa . . . that as far back as three years ago I warned you against such a policy and that on the outbreak of the European war I had again repeated that warning to Gen. Smuts. . . . As a result of that policy a number of officers and men, who as far as I know were loyal, have become rebels." To this Botha replied that the Government's policy was "not only supported but demanded by the vast majority of the population of the Union," and that, moreover, he possessed proofs that Maritz's plot was formed long before the Government's decision was made. He ended with a moving appeal to Steyn to speak a word "to warn our people against treason, against the everlasting stain that anything of the kind would be upon our national honour, and against the incalculably fatal consequences." No sign in reply came from Onze Rust. On Oct. 22 Botha again wrote to Steyn, informing him of the imminent revolt of de Wet, Beyers and Kemp. In this letter Botha referred feelingly to the outcome of an insurrection "headed by men who in the past have been our honoured leaders" and once more appealed to Steyn to turn those men "from the path of destruction where they now stand." Botha suggested that Steyn should summon de Wet, Beyers and Kemp to a conference at Onze Rust, and now at length Steyn acted. From Oct. 23 onward, and after hostilities had begun he used his efforts to bring the rebel leaders to reason. But only after he had been beaten did Beyers go to Onze Rust, nor was it until he, too, had been defeated that de Wet showed any desire to visit Steyn. The ex-President himself publicly uttered no word. It may here be added that two years later Steyn died and the restraining hand which he had laid upon the extreme manifestations of Dutch racialism was removed. Hertzog, who had not joined the rebels, and had indeed given Steyn some help in trying to induce de Wet and Beyers not to proceed to hostilities, was then free to develop his demand for separation from the Empire.

De Wet captured.

General Botha delayed operations against Beyers and de Wet as long as there was any possibility of avoiding bloodshed, indeed the Government was sharply criticized for allowing de Wet undisturbed to overrun the northern part of the Free State on pretext of carrying on private negotiations. Rebel activity in the Transvaal at length compelled action and Gen. Botha himself took the field against his old colleagues. If that action finally destroyed his influence with part of the Boers, it won the support of many others and it was one of the disappointments of the rebels that so many men of their own blood sided with the Government. On Oct. 27 Botha dispersed a rebel commando led by Beyers at Commissie Drift, S. of Rustenburg. Even after this encounter—in which the casualties were two or three men wounded—efforts were made to avoid further fighting, but unavailingly. Beyers crossed into the Free State and on Nov. 7 a fight took place at Gruis Drift, on the Vet river, in which some 400 rebels were taken prisoners. It was after this defeat that Beyers, under a safe conduct, sought a belated conference with Steyn, a conference which led to no result. Meanwhile de Wet had been active in the Free State, his burghers freely pillaging all whom they pleased. At Vrede on Oct. 29 he denounced "the ungodly policy of General Botha," the "miserable pestilent English" and described the S.W. expedition as "a dastardly act of robbery." On Nov. 9 he seized Winburg; he had refused to go to Onze Rust to see Steyn. Smuts rightly gauged the mentality of de Wet in stating that unless he were "convinced by force" he would not listen to reason. On Nov. 12 Botha defeated de Wet's main commando, some 2,000 strong, at Mushroom Valley, 18 m. S.E. of Winburg. After this de Wet was willing to go and see Steyn, but the Government was convinced that the time had gone by for the rebels to "extort peace terms" and on Nov. 17 Smuts informed Steyn that now unconditional surrender was required, on the basis of very lenient terms already announced. Pressed by the Government troops de Wet doubled and redoubled and finally, with some 50 followers, turned due W. hoping to make German territory. But he was overtaken about 100 m. W. of Mafeking—his tired horses being no match for the fleet armoured cars chasing him—and surrendered, Dec. 1 (1914) to Col. Brits. A few days later the end came for Beyers. After his visit to Steyn he had rejoined his commando, and after an engagement at Bultfontein on Nov. 16 made N. intending to re-enter the Transvaal. On Dec. 8, in the Hoopstad district, he was once again defeated. With some 25 burghers Beyers reached the Vaal river near Zand Spruit closely pressed by a party under Field-Cornet P. H. de Necker. While the rebels put up a delaying fight, Beyers and one companion tried to cross the river on horseback. When fired upon they dismounted. Their horses managed to gain the further bank, but Beyers and his comrade, though they escaped the bullets, were carried away by the current and drowned. A week later (Dec. 16) the last of the rebel commanders, Fourie, was defeated and he surrendered. The rebellion was over.[1]

Altogether about 10,000 men had been in armed rebellion, while the number of their sympathizers was very considerable. In their ranks were three members of Parliament. The casualties on the Government side were 132 killed and 277 wounded. Of the rebels over 5,700 were either captured or surrendered—their casualties are not known, and many returned home during hostilities under assurances that by so doing they would not be prosecuted. Only one man, Fourie, an officer of the Citizen Force who appears to have deserted while on active service, suffered the last penalty. He was tried by court-martial and shot on Dec. 20. The rest of the rebels were leniently treated. De Wet, in June 1915, was sentenced to six years' imprisonment and a fine of £2,000; Kemp was sentenced to seven years' imprisonment and a fine of £1,000. Others received lesser sentences and few, if any, served their full term; de Wet, for instance, and 118 others were released in Dec. 1915 in time to spend their Christmas at home.

During the insurrection Hertzog's name had been freely coupled with that of the rebels, and in the parliamentary session of 1915 he made himself their advocate. He was no rebel, neither, he maintained, were de Wet, Beyers and their following. Their action was only "an armed protest" against the invasion of German S. West Africa.[1] Nor did Hertzog and his parliamentary supporters modify their attitude; they sought to gain at the polls what the rebels had tried to gain arms in hand. But Gen. Botha had no difficulty in enrolling thousands of Boer volunteers for the campaign in German S. West Africa; the force raised for that purpose was composed almost equally of Dutch and British S. Africans. The campaign ended in the surrender of the Germans on July 9 1915, and on his return home Botha received a triumphal welcome from Boer and Briton alike. Popular feeling against Germany had become intense with the sinking of the "Lusitania," which led to serious riots; in Johannesburg alone damage to German property estimated at £500,000 was done.

---

[1] Major Kemp had been sent, on Nov. 2, by Beyers on a mission to get arms and ammunition from Maritz. Kemp, who had with him some 800 men, appeared at Kuruman on Nov. 8 where he obtained supplies from the townsfolk. Followed up by loyal forces he made his way to German territory and joined Maritz at the end of November. In Jan. 1915, in company with Maritz, he reappeared, attacked Upington and was defeated. At the same place on Feb. 3, with over 500 men he surrendered to Col. (later Maj.-Gen. Sir) J. L. Van Deventer, while 100 of Maritz's men surrendered at Kakamas. Maritz and his immediate following withdrew to German S.-West Africa. Not wanted there Maritz went to Angola and to Lisbon.

Forces raised for War Service.

After the conquest of German S.W. Africa Nationalist hostility was aroused by the beginning of recruitment for service in Europe. The response to the appeal for volunteers, considering the hostility of the Nationalists, was excellent. First to last the Union (apart from forces used in suppressing the rebellion) raised 146,515 men for service in the World War, and of these over 30,000 served in Europe and 43,000 in E. Africa. These figures refer only to whites. Including the native labour contingents and the coloured combatant corps from the Cape provinces the total personnel of the S.A. forces on war service was 231,591. The casualties numbered 18,642, including 6,606 dead.

General Election, 1915.

None knew better than Gens. Botha and Smuts how deeply they were distrusted by a large section of the Dutch community. The general election held on Oct. 20 1915, fought on the issues raised by the rebellion, gave a very fair indication of the strength of the Dutch irreconcilables. Botha had appealed to the electors to sink their differences and "see the war through." Out of a total of 130 seats in the House of Assembly the S.A. (Botha's) party gained 54, the Nationalists (Hertzogites) 27 and the Unionist (mainly British) party 40. Labour, out of favour after the industrial upheaval, gained only three seats and there were six Independents (all anti-Hertzogites). Most of the Nationalist members were returned for constituencies situated in the districts where the rebellion had been. The luck of the ballot was with Botha and the Unionists for the figures of the poll showed the Nationalist strength to be greater than the number of seats secured. The figures were: South African party 93,374 votes, Nationalists 78,301, Unionists 48,484, Labour 25,305, Independents 12,029. Some 75% of the electors voted.

As a result of the election Botha was dependent for continuance in office on the support of the Unionists, and this was ungrudgingly given. There was some talk of Sir Thomas Smartt and other leaders of the Unionists joining the Ministry, but this was not done. The cordial support given by the Unionists to Gen. Botha was the more valuable as the Nationalists continued their agitation and increased their demands. Hertzog's efforts were powerless to affect the policy of the Cabinet but they led to increased bitterness in S. Africa. The Government had, nevertheless, no difficulty in securing volunteers for service in German E. Africa. The appointment of Gen. Smuts as commander of the British forces there entailed his absence from the Cape, an absence prolonged by his selection early in 1917 as a member of the Imperial War Cabinet in London. This was a serious loss to Botha in the conduct of home policy.

Republican Propaganda.

After Steyn's death (in Nov. 1916) Hertzog became more openly hostile than ever to the imperial connexion. At Stellenbosch in May 1917 he declared that S. Africa's autonomy (*zelfstandigheid*) entitled her to remain neutral in the war and that no real self-government could exist without independence of all other countries, including Great Britain. "The only bond that binds us together," he said, "is our common King but under him we each stand separately and independent of each other." But even "the common bond" was irksome, and the logical outcome of Hertzog's policy was seen in the adoption by the Nationalist party of republicanism as a plank in their programme, to be achieved "by steady constitutional pressure." The opposite policy was seen that year in operation in London. General Smuts was sitting in the Cabinet with equality of status with that of the ministers of the United Kingdom, and the Imperial War Conference of that year (1917) declared the Dominions to be "autonomous nations of an Imperial Commonwealth with an adequate voice in foreign policy." The adoption of republicanism in the Nationalist platform was strongly resented in the Union and on the motion of Mr. Merriman—who voiced very accurately the feelings of most of the Cape province Dutchmen—a motion condemning republican propaganda was carried (June 18 1917) by 72 votes to 21. The propaganda, however, grew in virulence. There was, said Gen. Botha in 1918, an agitation on foot to establish a republic by violent means.

It will be seen that throughout the World War S.A. had been divided by bitter racial strife. It was not, however, the traditional clash between Briton and Boer, but a combination of Boer and Briton against a section of the Boer community, and this marked an advance on old conditions. Nor were all those who gave Hertzog their votes really prepared to follow him to all lengths. But the defeat of Germany brought no respite in the Nationalist agitation—it rather increased, nor did it require much astuteness for Hertzog to fix upon President Wilson's declarations in favour of self-determination as a weapon. The last half of 1918 was, however, noteworthy in S.A. for other than political happenings. In the influenza epidemic which swept over the world S.A. suffered very severely. Influenza attacked both the white and coloured population and was most severe in the Cape peninsula. A total of 54,899 deaths were registered in Aug.–Dec. 1918. Of these, 11,510 were among whites and of these 6,094 occurred in the Cape province. (There was a recurrence of the epidemic in 1919, but in a milder form.)

Nationalists and Self-determination.

As soon as the World War ended Gen. Botha was summoned to London[2] where he joined Gen. Smuts. They represented S.A. throughout the peace negotiations and both were signatories of the Treaty of Versailles, under which S. A. and the other British Dominions became original members of the League of Nations. The counter-measures of the Nationalists failed. No sooner had hostilities ceased than the central committee of their organization sent a note to President Wilson expressing their desire to lay before him their aspiration that the principle of self-determination should be applied as much to the S.A. people as to "other small nations." Mr. Wilson declined to interfere. General Hertzog was at heart most concerned to regain independence for the ex-Dutch republics. Thus in a debate initiated by Sir Thomas Smartt on the republican propaganda in the House of Assembly in Feb. 1919 he maintained the right of the Free State to break away from the Union. At the opening of the session in Jan. one of his henchmen, Mr. Tielman Roos, in the debate on the resolution congratulating King George on the victory of the Allies, had moved an amendment declaring that peace could only be maintained by the "complete application" of the principle of self-determination enunciated by the Allied and Associated Powers. This amendment had been defeated by 73 votes to 20.

Hoping to get some advantage out of the struggle going on around the Peace Conference table in Paris Gen. Hertzog and certain of his colleagues determined to visit Europe. Hertzog held that the question of the Union as a whole becoming a republic was a matter in which Great Britain had no voice, but meanwhile Great Britain might "redress the wrong done to the ex-Dutch republics by restoring to them their freedom." He and his colleagues would lay their case before the Prime Minister, Mr. Lloyd George. When it was announced that a Nationalist deputation would leave for England, trouble arose. The crews of the mail steamers intimated that they would not put to sea if Gen. Hertzog and his colleagues were passengers. This difficulty was met by the offer to bring them over to England in a British man-of-war. Hertzog, however, realized that that would render him ridiculous; eventually he and his friends sailed in a Dutch vessel to New York, whence they took passage to Europe. They saw Mr. Lloyd George, they visited Paris, and they returned to S.A. unsatisfied. Mr. Lloyd George pointed out to them, among other things, that the restoration of the Dutch republics was not a matter to bring before the Imperial Government; the Union of S.A. was a self-governing state and could speak only through its own constitutionally chosen Ministry.

---

[1] In a proclamation issued by Beyers and de Wet on Oct. 29 1914, they signed themselves "generals of the protesting burghers."

[2] In Botha's absence Mr. F. S. Malan was acting Prime Minister.

Botha's Death: Smuts Prime Minister.

The Treaty of Versailles having been signed (June 28 1919) Gens. Botha and Smuts returned to S. Africa. A few weeks later Gen. Botha, whose health had been indifferent for some time, died (Aug. 27) after a very brief illness. In him S.A. lost one of her greatest sons, and the Empire a man who, whether as friend or foe, had been large minded, sincere and whole-hearted. With regard to Botha's successor Lord Buxton, the governor-general, had no hesitation. Gen. Smuts was the inevitable choice. In Sept. at a special session of Parliament, the peace treaty with Germany was debated, and a resolution passed asking King George to ratify it on behalf of the Union. In this debate and on many other occasions Gen. Smuts dwelt on the enhanced position S.A. had acquired as a result of the World War; she had not only become an equal member of the British Commonwealth, with a voice in the direction of its foreign affairs, but a separate entity in the comity of nations. Greater freedom it could not possess; it was mistress of its own destinies, but, so he argued, it was not open to the Union to break away from the British connexion.

The war had ended, economically S.A. had suffered from it less than might have been anticipated, and a period of trade expansion had set in. Smuts, both in generalship and in diplomacy, had been the greatest figure which the British Dominions had thrown up during the conflict. He was presently called upon to get the verdict of his own people on his policy and actions, for by the constitution, another general election was due. It was held in March 1920 in circumstances somewhat unfavourable for the Ministry. Though on imperial questions the Unionist party and the S.A. party held the same views, there were many points on purely domestic issues on which they did not agree and they opposed one another at the polls, often too when a Nationalist was contesting the same seat. There were several triangular and even some quadrilateral contests—caused by Labour candidatures. And the election showed that the Nationalists, determinedly narrow in their outlook—for many back-veld Boers the world outside S.A. counted as nothing—had gained strength. There were 134 seats to be filled as against 130 in 1915. The Nationalists came out the strongest single party with 45 seats; the S.A. party held 40, the Unionists 25, while Labour gained the remarkable number of 21 seats. Three Independents completed the list. The Nationalists were jubilant and with the help of the Labour members hoped for great things. Gen. Smuts was in a difficult position but he resolved to meet Parliament and carry on the Government. This could only be done with the help of the Unionists—and that help was given to Smuts as freely as it had been given to Botha. Even so, the margin of votes was exceedingly small and would have disappeared had not several of the Labour members on the main issues also supported the Ministry. As it was Smuts went through the session with remarkable skill and succeeded in passing more than one important measure—among others the Native Administration Act (*see* above).

Hereeniging Efforts.

The evidence that the election had afforded of the strength of the Nationalists could not however be ignored, nor was it possible that in the existing state of parties Parliament could continue to do its work efficiently or the country be at peace. Some way out must be found. Considering his race, it is not a matter for wonder that Smuts tried first to see if an accommodation could be reached with the Nationalists. A reunited party which would have the support of the whole Dutch community was a tempting prospect. Negotiations went on for some time; finally in Sept. 1920 a *hereeniging* (reunion) conference was held at Bloemfontein. It failed, and its failure might have been foreseen. On various points the Nationalists or the S.A. party were prepared for compromise, but when the test came it was seen that there was no bridging the gulf which separated them on essentials. Gen. Smuts and his party held firm to the principles of the unity of the Union and the preservation of the ties which linked the Union to the Empire. The Nationalists, on their side, refused to abandon the republican plank in their platform.

The 1921 Election.

Gen. Smuts consequently turned for support elsewhere. In a manifesto issued on Sept. 29 and addressed to "all right minded S. Africans, irrespective of race or party," he asked them "to join a new party which shall be strong enough to safeguard the permanent interests of the Union against the disruptive and destructive policy of the Nationalists." This was an open bid to the Unionists, nor were they indisposed to respond. Their fundamental principles were those of Gen. Smuts and his followers. But when at the conference of the S.A. party, held on Oct. 27, a resolution was adopted directing the head committee of the organization to take the necessary steps not for the creation of a new party, but for "an expansion of the S.A. party," some difficulty was created. The Unionists, who represented the bulk of the British section of the community, had, though with natural regret, been prepared to make a new combination, but they disliked the idea of simple absorption into a predominantly Dutch organization. These feelings were expressed at the Unionist party conference at Bloemfontein early in November. Counsels of patriotism prevailed and at a meeting between the Unionist executive and Gen. Smuts at Johannesburg on Nov. 27, a complete agreement was reached. The Unionists joined the S.A. party, which retained its name. Nor was it an unfitting title, though it would become meaningless if the fusion of the two races came about, and the old distinction between Boer and Briton obliterated. This possibility was precisely what the Nationalists (and also a few British extremists) most dreaded while it was the goal to which Smuts looked forward. Speaking in London on May 22 1917, he had declared "we want to create a blend out of various nationalities. We want to create a new nation and that is the South African nation. . . . I am hopeful that . . . we shall in the end succeed and create under our South African sun a new type in the world."

Having drawn together the supporters of "national unity of the European races and the economic development of S.A. along peaceful lines" Gen. Smuts made a new appeal to the country, backed by the whole strength of what had been the Unionist party. Smuts fought the election on the republican issue. With the alternative thus nakedly put the Nationalists took alarm. They knew that success for them on such an issue was impossible and therefore they tried to confuse the people, and snatch a victory on other grounds. Severance from the British Empire, the turning of the Union into a republic, was not, they declared, their immediate object, rather was it an ideal which they hoped to attain in a remote future. This manœuvre deceived no one. Even if the Nationalists did not ardently desire a complete rupture with Great Britain they did want to secure at once complete ascendency in the ex-Boer Republics. During the election campaign Hertzog was induced to put the case baldly. Heckled at a meeting at Roodebank in the Standerton district he said that "even today (1921) he would accept a republic in the Transvaal and Free State and those Englishmen who objected might retain their British citizenship. If they had any grievances they would be represented by a British diplomatic agent." He admitted that if his wish were granted and difficulties arose the country would be in exactly the same position as before the Boer War.

The election was held in Feb. 1921 and resulted in a notable triumph for Gen. Smuts and the enlarged S.A. party. But it was significant that the Nationalist vote increased and that on balance of losses and gains they held two more seats in the new than they had held in the old Parliament. The distribution of parties was as follows:—South African 76, Nationalist 47, Labour 10, Independent 1.[1] The 76 seats held by the S.A. party compared with 40 in the old S.A. party and 25 in the old Unionist party. The gains of the enlarged party had been at the expense of the Labour candidates. But an analysis of the poll showed that Smuts had rallied to his side many doubtful voters besides those transferred from Labour. Nor could the Nationalists claim that those who voted for Labour candidates favoured their propaganda; there were in the Transvaal bitter contests between Nationalist and Labour candidates. In considering the figures of the votes cast it should be remembered that nine S.A. party candidates were returned unopposed, whereas only one Nationalist (Gen. Hertzog himself) was not opposed. It is also noteworthy that the Nationalists' successes were almost entirely in rural and remote constituencies, decisive evidence that their strength lay in the back-veld Boers. The figures were: S.A. party 138,942 (an increase of 19,455 compared with 1920), Nationalists 104,692 (an increase of over 8,000), Labour 28,983 (a decrease of over 12,000).

Following upon the election there was a reorganization of the Cabinet in which Sir Thos. Smartt became Minister for Agriculture, Mr. Patrick Duncan Minister for the Interior, and Mr. J. W. Jagger Minister for Railways and Harbours. Another leader of the late Unionist party, Sir Edgar Walton, was appointed High Commissioner in London. In June 1921 Gen. Smuts, Sir T. Smartt and Col. H. Mentz (Minister of Defence) came to London to attend the Imperial Conference. In regard to matters affecting the internal affairs of S.A. the most delicate question discussed by the conference was the status of British Indians (see above). While the ministers were still in London the question of the future of Rhodesia advanced a stage. A deputation had been invited to discuss with the Colonial Office a plan for ascertaining whether Rhodesia was prepared to take a referendum upon a definite scheme of self-government (*see* RHODESIA). Largely however as the result of the general election in the Union in Feb. 1921 the party in Rhodesia which preferred to join the Union had again grown in strength. The Rhodesian deputation saw Gen. Smuts early in Sept., immediately after his return to Cape Town, when it was made clear that though the admission of Rhodesia as a province of the Union would be welcomed, it was a matter for the Rhodesians to decide.

Native Unrest.

In the 1921 election campaign the Nationalists sought to evade the main issue partly by assailing the policy of the Government on native affairs. That policy has already been outlined; by Nationalist orators addressing the back-veld Boer the conciliatory measures adopted were denounced as "coöperating with niggers"; by Nationalist orators addressing audiences in the Cape province—where the native had the vote—the segregation clauses of the Act of 1920 were denounced as evidence of the bias of the Government against the Kaffirs. This method of electioneering had elements of danger, for discontent among considerable sections of the natives was pronounced. The chief ground of complaint was in regard to their economic position. The natives had been quick to learn the lesson of the strikes of white labour on the Rand and in 1917 and subsequent years there had been strikes and native disturbances at Johannesburg and other cities. There were also many evidences of political and religious ferment. Serious disturbances at the Lovedale missionary institute in April 1920,[2] were followed on Oct. 23 of the same year by a disastrous collision at Port Elizabeth. In the last-named case the native labourers had struck for higher wages and their leader, Masabalala, president of the Native Workers Union, had been arrested and refused bail. An angry crowd gathered before the court house and fire was opened upon it by the Europeans who feared an attack. Rioting and incendiarism ensued and for a time it looked as if Port Elizabeth would be at the mercy of the natives. In all over 20 persons (including one European) were killed and 40 injured. The action of the natives was condemned by many of their leaders, such as Dr. Rubusana, an ex-member of the Cape provincial council and by Mr. Jabavu,[3] a graduate of London University, who, while calling for the remedy of grievances, denounced the "Bolshevist propaganda" permeating the native mind. An investigation made by a commission appointed by the Government tended to show that the authorities at Port Elizabeth had mishandled the affair, and that bloodshed might have been avoided had Masabalala been granted bail. It was a cause for angry recriminations later when Nationalist candidates for Parliament appeared on the same platform as Masabalala.

A greater tragedy followed at Bulhoek, near Queenstown on May 24 1921. For months several hundreds of natives known as Israelites, proselytes of one Enoch Ngijima, who gave himself out as the prophet Enoch, had been allowed to remain at Bulhoek and they had become a menace to the community. Whether or not earlier action might have averted the calamity is not certain; in this case the Government acted with great forbearance. But at length it became imperative that the Israelites should be compelled to return to their homes, and forces were moved to Bulhoek to be in readiness for eventualities. Enoch proved intractable and his followers proved themselves possessed of all the fanaticism of dervishes. On May 24, when preparations were being made for their removal, large numbers of them, though destitute of firearms, charged the troops, and some 400 were killed or wounded before their ranks wavered and broke. On this occasion the soldiers had no option but to fire; the Israelites, though their reckless charge exhibited only fanaticism, had also shown military skill and had dug trenches and prepared ambushes for the troops. Their dispersal was a necessity. Neither did responsible native leaders approve Enoch's teachings.

The Bulhoek tragedy was, however, regarded by the leaders of the natives as the outcome of unjust economic laws. The case against the Government was put by Mr. Selby Maimang, the president of the Industrial Commercial Workers Union—a union which embraced nearly all the native and coloured trade organizations in South Africa—at its meeting at Cape Town in July 1921. Mr. Maimang said that the land laws of the country were to blame for the catastrophe. Enoch's following had fallen victims to bad influences brought about by bad administration. Coloured workers were smarting under irritating disabilities in every walk of life. Mr. Maimang, a representative of moderate opinion among the natives, reprobated the useless stirring up of passions, declaring it to be the duty of the Union to educate all non-European workers to guard their own interests. Organization was essential; they could only ward themselves against exploitation by a distinct band of comradeship. As to that many European employers were already convinced that combination among the natives engaged in industries was a factor which they could not ignore.

The decline in trade which became noticeable in the middle of 1920, and was acute in the first half of 1921, added to the difficulties of the industrial problem. It affected both white and coloured labour severely and caused renewed agitation on the Rand, while diamond mining came almost to a standstill.

Lord Buxton's tenure of the office of governor-general and high commissioner came to an end in 1920. In very difficult circumstances he had carried out his duties with firmness and in a manner which won the esteem of all classes, including the Nationalists. He identified himself with the interests of S. Africa. On giving up office he was granted an earldom (Oct. 21 1920), and on his return home served as chairman of the committee appointed to inquire into the future government of Rhodesia. Prince Arthur of Connaught was chosen as the new governor-general and high commissioner. He reached the Cape on Nov. 17—ten years after his father, the Duke of Connaught, had opened the first session of the Union Parliament.

---

[1] These figures include the results of recounts and of two by-elections in the Transvaal, necessitated by ties in the voting at the general election. At two by-elections for Cape Town constituencies in Sept. 1921 Labour candidates won, bringing the Labour members of Parliament to 12 and reducing the S.A. Party to 74.

[2] The students attempted to burn down the college buildings and murder the professors. The rioting began with complaints as to the quality of the bread served, which was the same for whites and blacks.

DEFENCE AND MILITARY INSTITUTIONS

The establishment of union in S. Africa in the year 1910 involved a fusion of the different military systems then obtaining in the four colonies which became original Constituent Provinces in the new amalgamation. These systems were as follows. The Cape Colony maintained a permanent force (the Cape Mounted Riflemen) together with a volunteer force and a cadet organization. The forces of Natal consisted of a military force, of much the same strength (3,000–4,000 men) and character as the volunteer force of the Cape and a reserve organized in rifle clubs, and included cadets again on much the same lines as those of the kindred organization in the Cape Colony. The two forces contained regiments of long standing and high reputation gained in many local campaigns and embraced all arms. These regiments retained their identity in the new forces. A volunteer force on modern lines, confined to the towns, except for two mounted regiments recruited from country districts, was the form of military organization which had been adopted by the Transvaal. This force, however, had only been in existence for seven or eight years at the date of union. In the same period an efficient cadet system had been instituted. In each of these three colonies a small permanent staff was maintained. The Orange Free State relied upon the burgher system based on universal male liability for service in time of war, a principle accepted indeed by all the four colonies, and reaffirmed in the present S. Africa Defence Act.

It was not until June 14 1912 that it was found possible to pass a law embodying the recommendations which had been made and the conclusions which had been arrived at after investigation, but upon this date the S. Africa Defence Act, 1912, was placed on the statute book. Field-Marshal Lord Methuen, then commander-in-chief of the British forces in S. Africa, evinced great interest in the matter of South African defence and assisted the local military authorities in the conferences and deliberations which preceded the passing of the Act. By this Act every citizen between 17 and 60 (both included) is liable to render personal service in time of war in defence of the Union "in any part of South Africa." A permanent force is provided for, but in May 1921 an amending bill was before the House of Assembly, which if accepted would materially alter the composition and functions of this force.

Every citizen is liable to undergo, beginning in his twenty-first year, four years "peace training" in the Active Citizen Force, which constitutes the first line of defence. It is however permissible for any citizen to enter voluntarily for his "peace training" in any year between his 17th and 21st years (both included). The number of citizens to be trained in the Active Citizen Force is placed in the Act at 50% of the total number liable, but Parliament has power to increase this number. If the number required for training in any district is greater than that of its voluntary entries, a ballot may be taken to make good the shortage. After four years' "peace training" in the Active Citizen Force the citizen goes to Class A of the Citizen Force Reserve where he remains until his 45th year. A Coast Garrison Force is established, and service may be undertaken in that force as equivalent to Active Citizen Force "peace training." A similar concession is allowed to citizens who may elect to serve in the Royal Naval Volunteer Reserve which is part of the Royal Naval Reserve constituted under the Naval Forces Act 1903 (Great Britain and Ireland) and may be placed at the disposal of the Royal Naval authorities. Any citizen who at 21 has not been entered for service in the Active Citizen Force (or one of its equivalents) is compelled to serve for four years in a Rifle Association where he is taught to be "familiar with the use of military weapons of precision," after which he is included in Class B. of the Citizen Force Reserve until his 45th year. Cadet service is compulsory, but a request from a parent or guardian that a boy "be exempt from cadet training" secures a certificate of exemption. Several special reserves are provided for in the Act, and one of these, the Veteran Reserve, was largely used in establishments within the Union during the period 1914–8. The National Reserve consists of all citizens who, liable to render personal service in time of war, do not belong to any other portion of the forces. The full establishments of the Active Citizen Force in 1914 represented a force of approximately 30,000 men. The periods of "peace training" are not more than 30 days in the first year and 21 days in each subsequent year with a maximum of continuous training (in camp) of 22 and 15 days respectively.

The response to the first year's (1913) call for entries was striking, and 44,193 citizens entered voluntarily for training, producing a strength of 14,000 in excess of requirements. The following year saw the outbreak of the World War, and the annual registration in Jan. of all citizens who reach the age of 17 in the year has been in abeyance since Jan. 1914.

Immediately after the passage of the Defence Act in 1912 steps were taken to establish the military system for which it provided. The permanent force at its inception consisted of two portions. The staff was employed partly at defence headquarters and partly distributed in the 15 military districts of the Union. The South African Mounted Riflemen (five regiments and three batteries of field artillery) was, with the exception of the artillery, employed solely on police work, and divided into very small detachments on posts. The whole of the police force had in May 1921 been placed under the command of the commissioner of police, and the new military arrangements proposed in 1921 contemplated a reduced permanent force employed on military duties alone.[1]

The complications introduced by the rebellion made it impossible to call out the whole of the citizen forces in the formations in which they strictly belonged, and, though a considerable number of units of the Active Citizen Force were called out by proclamation in the regular way, most of the Dutch members of the forces—many of whom were beyond the age of those in the Active Citizen Force—were specially embodied under the old commando system to which they had been formerly accustomed. Thus the whole of the Dutch-speaking units serving under Gen. Botha in the rebellion and German S. W. Africa were organized on a commando basis, the English speaking units being those of the Active Citizen Force. In the rebellion 30,000 troops (of whom 20,000 were of Dutch descent) were employed at a cost of £5,100,000 to the Union Government, and casualties to the extent of 132 killed and 242 wounded were sustained by the loyal troops. In German S.W. Africa 67,237 Union troops were engaged at an approximate cost of £15,000,000 and 127 lives were lost, the wounded amounting to 272.

---

[1] The S. African Mounted Riflemen, as a brigade, served in the rebellion of 1914, and at the close of the campaign in German S.W. Africa, but thereafter were retained in the Union, though many individual members of the force served with credit and distinction on many battle fronts.

At the conclusion of the campaign in German S.W. Africa the Union Government turned its attention to other fields in which assistance was needed. These were oversea, and the liability of S. African citizens to military service did not extend to such distant spheres of activity. It was thus necessary to devise special measures to furnish troops composed of S. Africans who were prepared of their free will to serve beyond the limits of S. Africa.

In July 1915 the Imperial Government accepted the offer of the Union Government to furnish personnel for units for service beyond S. Africa. A director of war recruiting was appointed and recruiting was maintained until the Armistice in 1918. The following are the numbers of all the forces which were raised in the Union for the different campaigns in which South African troops took part:—

The rebellion	30,000
German S.W. Africa	67,237
Overseas (France)	30,880
German E. & Central Africa	47,521
For service in the Union	5,180

The achievements of the S. Africans in France and their fortitude under hardship in the East African campaign are matters of history.

The coloured community in the Cape province had early expressed a strong desire to furnish a representative body of troops, and an infantry battalion of the Cape Corps was formed, and later a second battalion was recruited. The regiment after gaining valuable experience in E. and Central Africa was sent as one battalion to Egypt and Palestine, where it served with credit. The natives of the Union, who throughout the war maintained an attitude of complete self-control and loyalty, furnished for non-combatant duties 35,000 men for German S.W. Africa, 10,600 for France and 18,000 for E. and Central Africa. Some hundreds of natives lost their lives in the transport "Mendi" which was sunk in the English Channel.

While, as a consequence of the large number of men who, especially at the outset of the war, joined the British forces as individuals, a full statement of the casualties sustained by S. Africa in the World War is not available, the following figures give some idea of the incidence of losses. In the S. African Infantry Brigade in France nearly 15,000 casualties were sustained, of which some 5,000 were killed. In the Cape Corps which served in E. Africa, Egypt and Palestine, the casualties in dead and wounded totalled 701. Disease and privation took heavy toll in East Africa and hundreds of men returned to the Union from the campaign in that country shattered in health. The Royal Naval Volunteer Reserve supplied and maintained a strong detachment for service in the Grand Fleet and naval establishments. Hospitals, camps, supply and ordnance depots, and veterinary hospitals were formed in S. Africa under Union control, and heavy purchases were made and vast amounts of supplies were forwarded to E. Africa under Union military supervision on behalf of the Imperial Government.

As regards the future military arrangements of the Union the main provisions of the Act of 1912 have been accepted as sound, though methods will doubtless be reformed to a considerable extent. An amending defence bill in May 1921, in addition to important changes in the constitution and functions of the permanent force, provided for a resumption of registration, with retrospective effect as regards citizens who should have been registered in and since 1918; also for the working of the normal training system in 1922, and for a substantial increase in the period of continuous "peace training," as well as for increasing cadet efficiency, by additional expenditure of public funds and by extending the age for cadet service. The bill was, however, dropped in June 1921. (J. J. C.)

SOUTH CAROLINA (*see* 25.499*).—The pop. of the state in 1920 was 1,683,724, an increase of 11·1% over the previous decade, as compared with 13·1% and 16·4% during the two preceding decades. During the decade 1910–20 the whites increased from 679,161 to 818,538, or from 44·8% of the total pop. to 48·6%. The density was 55·2 per sq. mile. The urban pop. was 17·5% of the whole, as compared with 14·8% in 1910. The pop. of Charleston was 67,957 and the decennial increase 15·5%, the white increase being 28·3% and the negro 4%. The white pop., increased by war industries, was 52·4% of the whole, constituting a majority for the first time in about 200 years. The pop. and decennial increase for the other leading cities were as follows:—

	1920	1910	Increase per cent
Columbia	37,524	26,319	42·6
Greenville	23,127	15,741	46·9
Spartanburg	22,638	17,517	29·2
Florence	10,968	7,057	55·7
Anderson	10,579	9,654	9·5
Sumter	9,508	8,109	17·3

Manufactures.—Textile mills paid very large dividends during 1917–20, and in addition doubled or trebled their capital. Wages rose greatly, but were cut 30 to 50% in the depression of 1920–1. The number of spindles in 1918 was 4,914,524; of operatives in 1919, 50,898, a decrease of about 4,000 since 1916; the bales of cotton consumed diminished from 972,000 in 1916 to 779,000 in 1918–9; capitalization that year was $201,237,320. Almost half the motive power in 1920 was hydro-electric. Unionization has not proceeded far among textile workers, though skilled trades in larger places are generally organized. The State Board of Conciliation, created in 1916, arbitrates labour disputes on invitation or investigates them on its own motion or the order of the governor. Women are forbidden to work in stores after 10 P.M. or over 12 hours in one day.

Agriculture.—The coincidence of the World War and a large cotton crop in 1914 demoralized farming. A law was passed forbidding the planting of more than a third of a farm's acreage in cotton, but was repealed before the next planting season. An enormous inflation of values soon followed and in turn was succeeded by a decline of prices from about $0.40 to $0.10 or $0.11 in six months (1920–1), entailing great hardship. Legislation (1912) sought to stabilize agricultural prices by a system of state warehouses for holding products for a favourable market. Private capital has been extensively invested to the same end. The boll weevil became a serious menace in 1920 in the south-western counties. A packing plant with a daily capacity of 400 hogs was established in Orangeburg. Butter-making in coöperative creameries has made some progress. Under the law of 1920 extensive drainage projects were undertaken. Agricultural methods have improved; farm-houses are better; banks, which have increased in number and capital, finance the farmer directly at greatly lower cost than formerly charged by "lien merchants." South Carolina led all the states in 1917 in crop value per acre with an average of $63. The value in 1918 was $75. According to state Government estimate cotton covered in 1920 45% of the cultivated acreage and represented 50% of the value of the 13 leading crops. One million five hundred and thirty thousand bales were raised, the state's acreage being fourth and its production second in the Union. Corn, second in value, amounted to 42,370,000 bushels. Other crops were: tobacco 66,950,000 lb.; rice 120,000 bus.; sorghum 1,500,000 gal.; peanuts 1,620,000 bushels. The average value of ploughed lands was $61 per acre as against $91 for the United States. Average monthly wages for adult male farm labour without board were $41.80, next to the lowest for any state. During 1910–20 the number of farms increased from 176,434 to 192,693; improved land from 6,097,999 ac. to 6,184,159 ac.; average value per farm from $2,223 to $4,946; average value per acre from $29.02 to $76.70.

Education.—School legislation since 1910 included an Act for compulsory school attendance in 1919 throughout the state, increased state additions to local funds, calculated to ensure after 1920 a seven-months' term in the poorest districts; night schools for adults; consolidation and grading of rural schools, with transportation for children; an increased number of high schools; special teachers and inspectors in rural and textile districts; greatly improved school buildings; enlarged facilities for agricultural, vocational and home economics training; state standard certification of teachers and enforcement of payment for tuition at state colleges by those able to pay. The most significant principle underlying the forward movement in education has been the recognition of the necessity of greater assistance from state funds and greater power in the state authorities as distinguished from the local divisions. Difficulties have been the lack of competent teachers to carry out the enlarged programme and maintain the higher standards, the shortness of the rural school term, and excessive local authority to do or neglect to do what it pleases. The expenditure on common schools in 1918–9 exceeded $8,000,000. Attendance in common schools in 1919–20 for whites was 226,065; for negroes, 251,980; total 478,045. There were in that year enrolled in the 36 colleges in the state 12,000 students, of whom a third were negroes.

The three most numerous religious denominations, the Baptist, Methodist and Presbyterian, have added materially during 1910–20 to their extensive work in higher education. All but 11 of the 36 institutions for higher education in the state were in 1920 under church control, and these institutions contained a thousand more students than all state and other non-sectarian institutions combined.

Social Legislation.—Every attempt of forces of reaction to abandon a step in the large number of forward moves in social legislation since 1910 has been defeated, usually overwhelmingly.

****These figures indicate the volume and page number of the previous article.***

In 1912 race gambling was forbidden. In 1913 the penitentiary hosiery mill was abolished as harmful to the health of the prisoners. The State Board of Charities and Corrections, created in 1915, was reorganized in 1920 as the State Board of Public Welfare. The state hospital for the insane was entirely remade, materially and administratively, during 1915–9. A school for the feeble-minded was established in 1918. The placing of orphans and homeless children was taken over by the state in 1920. In 1918 the Industrial School for Girls, a reformatory institution for white girls, was established and the reformatory for negro boys was reorganized. The probate judge in each county is constituted a juvenile court, and several cities have undertaken remedial work for juvenile delinquents and dependents. Penal and charitable institutions (including church and private charitable institutions) have been since 1915 under state inspection. Since 1918 diseased women prisoners of all classes are held until cured. The age of consent was raised in 1921 to 16 years. No city has acted upon the permission in 1915 to segregate whites and negroes by city blocks. Marriage licences were required by law in 1911 and registration of births and deaths in 1914. Medical inspection of school children was made state-wide in 1920.

Finance.—The budget system, concentrating responsibility on the governor and the chairmen of the two legislative finance committees, adopted in 1919, has tended to economy and system, though the Legislature may disregard without any limitation the recommendations. The State Tax Commission, created in 1915, has improved the administration of the tax laws. The assessed taxable value of all property in 1920 was $448,222,786, being from a fourth to a third of the market value. For the state government there was raised a revenue of approximately $6,000,000; for county governments $12,000,000; for common schools (local tax) $8,000,000; and for municipal government between $5,000,000 and $6,000,000.

Political History.—The class feeling that has always been strong in South Carolina politics found violent manifestation during the governorship of Coleman L. Blease, who served two terms from 1911 to 1915. Blease's political tactics were calculated to appeal to the lower and less literate elements of the state; he quarrelled with the state Supreme Court, with the General Assembly, with other state officers and with the U.S. authorities. The Legislature was at all times controlled by his opponents, and probably more measures were passed over his veto than had been so passed in the case of all former governors combined. He startled a congress of governors at Richmond, Va., in 1912 by an open advocacy of lynching, and while governor he pardoned or paroled more than 1,500 criminals. At the time of his resignation (a few days before his term expired in 1915) he had freed all but 150 convicts, the number then said to be remaining in the institutions of the state. Almost his last official act was an order disbanding the state militia; this was promptly countermanded by his successor. Resigning without giving any explanation, he was succeeded for five days by Lt.-Gov. C. A. Smith. In 1918 Mr. Blease made a campaign for election to the U.S. Senate, taking extreme ground against the country's entering the war. He was overwhelmingly defeated. A progressive period began with the election of Gov. Richard I. Manning in 1914. A significant feature of the campaign was the support given to Prof. John G. Clinkscales in his advocacy of compulsory education. Gov. Manning's two administrations were marked by constructive legislation and effective coöperation with the national Government. Gov. Robert A. Cooper was elected in 1918 on a platform that made education its chief plank and frankly announced that as the result of progressive legislation taxes would be higher. He was reëlected without opposition in 1920. His chief measures were the strengthening of the public schools, the creation of a budget system and the consolidation of management of charitable and correctional institutions. The Australian ballot was put in force (1921) in primaries, though not in the general election, the latter being merely a formal ratification of the former as the Democratic nomination is equivalent to election.

The World War.—Of the total of 78 Congressional Medals of Honour awarded, South Carolina received six. The total number of men sent by South Carolina into the war was 54,254, not including those who had enlisted before the Unites States declared war. The amount of Liberty and Victory loans and other Government securities bought was $94,211,244, and $3,027,740 was contributed to Red Cross and similar appeals.

BIBLIOGRAPHY.—Snowden (editor), *History of South Carolina* (5 vols. 1920); *Reports* of S.C. Superintendent of Education, Treasurer, Comptroller-General and Commissioner of Agriculture, Commerce and Industries; S.C. Statutes at large. (D. D. W.)

SOUTH DAKOTA (*see* 25.506).—The pop. of the state in 1920 was 636,547, as compared with 583,888 in 1910, an increase of 52,659, or a little more than 9%. The average density in 1920 was 8·3 per sq. mile. The rural pop. was 84% of the whole in 1920, against 86·8% in 1910, an increase of 27,460, or 5·4%. The urban pop. (cities with 2,500 inhabitants and over) was 101,872 in 1920 against 76,673 in 1910, an increase of 25,199, or nearly 33%. The pop. of Sioux Falls increased 79·7% to 25,176 in 1920. Its rapid growth is due largely to the opening of extensive packing plants, stock yards and factories. Aberdeen in 1920 had 14,537 inhabitants; Watertown, 9,400; Mitchell, 8,478; Huron, 8,302; Rapid City, 5,777; Yankton, 5,024; Lead, 5,013; and Pierre, the state capital, 3,209. The foreign-born white pop. in 1920 was 82,372, of which 16,807 were Norwegians, 8,569 Swedes, 5,983 Danes, 15,670 Germans, 11,191 Russians, 4,453 Canadians, 2,943 British.

Communications.—A panoramic picture of the surface of the state in 1921 would present many changes from one in 1910, but both pictures would have the appearance of a chess-board, of which the country roads, running a mile apart from E. to W. and from S. to N., would mark the squares. In the hills, near river beds, in the bad lands, and in uncultivated and thinly populated portions, the roads are not uniformly maintained. The law provides that they be 66 ft. in width. Each square mile of land is called a section and contains, including one-half of the roads on the four sides, 640 ac. of land. The roads are still for the most part dirt roads. During the decade 1910–20 they were considerably improved by grading and elevating the centre. All of the 64 counties either have been actually engaged in the building of hard-surfaced roads or have started preparations for doing so. Advantage is taken of the Federal appropriations for highway purpose of which South Dakota's share was $4,458,545. State and county have made heavy assessments. Over $6,000,000 has been spent in building hard-surfaced roads. The state Legislature appropriated $2,000,000 for the construction, in 1921, at Rapid City, of a cement plant with a daily capacity of 2,000 barrels. A system of state trunk highways is supposed to connect all county seats and all towns having a pop. of 750 and more. A law provides that every county must employ a county engineer whose occupation is the planning of better highways. The automobile, the truck and the tractor have become more common than horsed vehicles, and have awakened the farmers to the advantage of good roads; 117,320 automobiles, enough to carry comfortably all the inhabitants of the state at one time were licensed in 1920. In connexion with the improvement of the roads, mention should be made of the bridge which was being built in 1921, at a cost of $1,500,000, across the Missouri river at Yankton, and which supplies the last connecting link of the Meridian Highway which crosses the state and extends from Winnipeg, Canada, to the Gulf of Mexico. Only about 300 m. of railway were built during the 10 years, 1910–20.

Agriculture.—There were 74,637 farmers in 1920, of whom 47,815 were owners, 26,041 renters and 781 managers. Many owners of the rented farms either lived on their farms or in the neighbouring towns, having rented to their prospective heirs. Though there were 74,637 farmers to 76,868 sq. m. of land, it is not the case that the great majority of the farmers occupied on an average a sq. m. of land each. All of the land area was not under cultivation; and among those who occupy the 34,636,491 ac. of agricultural lands outside of the corporate limits, the great majority of the farmers have each much less than the average, which is 454 acres. A minority, mostly west of the Missouri river, operate the large farms.

The farmers prospered during the 10 years, 1910–20. Their prosperity was evident in many other respects than the improvement of the highways and the large number of automobiles, trucks and tractors. Farm life underwent a rapid change. Electricity, telephones, rural mail delivery and consolidated school-houses added to the comforts and education of the people. Farm machinery was improved and bodily labour decreased. Many of the counties employ county agents, who are supposed to be highly trained agricultural experts. Because of the introduction of scientific methods, farm crops have become more varied and rotation of crops has become possible. The corn acreage in 1920 surpassed the wheat acreage, and the production of other grains and grasses increased. The introduction of alfalfa was especially noteworthy. Alfalfa was harvested three and four times a year. As a result, and also because of the large use of the silo, much more stock has been raised and more dairy products and eggs sent to market. The breeds of cattle, horses, hogs and poultry have been improved and many farmers raise only pure-blooded stock. A much greater number of farmers, as well as of city people, were in 1921 raising their own vegetables and fruits. Orchards and groves have increased in number and area. Because of many clusters of trees the unbroken prairie-like appearance of the farms has been modified. Farm values have more than doubled and the use of improved farm equipment has become much more extensive. There were not only many more farmers in 1921 than in 1910, but the investment per acre was much greater. The homes, barns, stables and granaries more recently erected are usually well built, are much larger than those of the past and have modern conveniences. Practically all of the towns with a population of 2,500 have their own electric light plants. The Homestake Mining Co. has a power plant costing about $2,000,000. The 1919 Legislature provided for an hydro-electric commission and appropriated $50,000 for the purpose of surveying the Missouri river to find water power. The engineers found three sites—Mobridge, Mulehead, and Medicine Butte—to be advantageous, in the order named. The commission presented a report to the 1921 Legislature and recommended that the Mobridge site be developed. It estimated that the dam and plant would cost $9,400,000 and the transmission system $7,833,000. Under the economic conditions existing in 1921 the Legislature hesitated to act favourably and the question was to be submitted to the people in the election of Nov. 1922. The following table shows the increase of farm products:—

		Acreage	Production	Value
Corn	1919	2,756,234	69,060,782 bus.	$89,779,016
“	1909	2,037,658	55,558,737 “	26,395,985
Wheat	1919	3,891,468	31,086,995 “	69,323,996
“	1909	3,217,255	47,054,590 “	42,878,223
Oats	1919	1,839,089	51,091,904 “	38,318,937
“	1909	1,558,643	43,565,676 “	16,044,785
Barley	1919	754,929	12,815,768 “	15,378,922
“	1909	1,114,531	22,396,130 “	10,873,522
Rye	1919	463,132	4,111,543 “	5,961,741
“	1909	13,778	194,672 “	115,126

“	1909	518,566	4,759,794 “	7,001,717
Potatoes	1919	58,180	2,863,186 “	7,157,983
“	1909	50,052	3,441,692 “	1,967,550
Hay and forage	1919	5,071,747	4,996,846 tons	71,988,845
“ “ “	1909	3,435,907	3,651,706 “	15,247,570

In 1919 receipts for the sale of dairy products were $12,222,562; of chickens, $1,477,500. The total value of domestic animals on farms was $232,364,625.

Minerals.—The value of the minerals produced in the state in 1919 was $5,500,000. Prof. Freeman Ward, state geologist, has computed the mineral products in yearly averages for the five-year periods, 1905–9 and 1915–9, as follows:—

	1905–9	1915–9
Bentonite	..	$5,480
Coal	$4,000	23,500
Copper	2,200	3,000
Gold	6,000,000	6,600,000
Gypsum	10,000	45,000
Lythia	1,000	38,680
Mica	50,000	10,400
Natural gas	18,120	19,000
Silver	97,900	126,000
Stone		
Crushed	23,480	80,000
Limestone	15,000	31,140
Sandstone	140,000	100,000
Structural materials	371,800	310,400

Manufactures.—The following table indicates the growth of manufactures:—

	1919	1909
Number of establishments	1,414	1,020
Proprietors and firm members	1,410	942
Salaried employees	1,242	682
Wage earners (average)	6,382	3,602
Capital	$30,933,030	$13,017,932
Salaries	2,076,199	615,621
Wages	7,905,426	2,297,512
Cost of materials	42,985,870	11,476,350
Value of products	62,170,782	17,870,135
Value added by manufacture	19,184,912	6,393,785

The principal industries in 1919 were flour-mill and grist-mill products, bread and other bakery products, printing and publishing, automobile repairing, cars and general shop construction and repairs by steam railway companies, lumber and timber products.

Doane Robinson, secretary of the state History Department, estimates the value of the total production of all commodities as $581,119,000 in 1918; $481,624,000 in 1919; and $316,305,000 in 1920. He gives the produce sold outside of the state as $270,536,000 in 1918; $376,720,000 in 1919; and $324,667,000 in 1920.

Finances.—The bank deposits were $206,496,073 in 1918; $235,617,276 in 1919; and $251,804,649 in 1920. They were protected by a depositors' guarantee fund amounting to $1,247,397 in 1920. The total assessed valuation of all taxable property was $1,598,544,562 in 1918, $2,095,154,178 in 1919, and $2,257,853,656 in 1920. The assessed valuation was usually not above half the real value, but even so amounted to $3,547 *per capita* in 1920. The tax levied was $17,781,439 in 1918, $21,470,598 in 1919, and $27,550,312 in 1920. The expenditure for the state Government, education, charitable and penal institutions was $1,255,593 in 1910, $9,711,964 in 1920. The state's debt in 1910 was $1,073,575 which was reduced until in 1919 the funds in excess of the debt amounted to $35,785. In addition there were in 1920 outstanding bonds, covering rural credit, highway and land settlements, amounting to $33,800,000.

Since 1917 South Dakota has had a noteworthy state rural credit system. Up to 1921, 13,575 applications had been made for loans amounting to $61,243,000. The rural credit board conservatively allowed only 7,915 loans, amounting to $31,083,450. This is more than four times the business done in the state by the Federal Farm Loan Board. The state can borrow money several per cent below the rate paid by individuals, and gives the farmers this advantage. The rural credit system having proved a success, the voters at the election of 1920 empowered the Government to make similar provisions for people in the towns. A law was consequently passed by the Legislature to create a municipal credit board and to make state loans to individuals for the purchase of homes. The state insures crops against hail at a low rate per acre. The Government administrative departments have been enlarged and a number of new commissions or departments have been created, including the following: insurance, railways, free circulating library, marketing, highway, rural credit, industrial, immigration, pure food and drug, state engineer, budget, tax, agriculture, charities and corrections, bank, depositors' guarantee fund, securities, health, pharmacy, live stock (sanitary), game and fish, coal mines, land settlement.

History.—South Dakota remained strongly Republican throughout the decade 1910–20. Of the political questions before the people the primary election law received the greatest attention. Successive Legislatures failing to deal with the matter by statute, an appeal to the initiative was successfully made at the election of Nov. 1912. Several months later, the Legislature of 1913 passed an Act of its own, and submitted it to the people at the 1914 election. It failed and the 1912 law remained in force. Thereupon the 1915 Legislature repealed the 1912 law and enacted one of its own, only to have the 1912 law in a somewhat revised form carried in the 1918 election. There has been much progressive legislation. The Non-Partisan League is a strong and active organization, but since a number of its policies have been adopted and carried out in legislation by the older parties it has not gained control of the Government. The code was revised and published in 1919. The number of men supplied by the state in the World War was 35,000, 10,000 being volunteers. There was purchased, in the state, of the Liberty and Victory bond issues $109,627,200. A bonus was voted for those who served in the World War and the sum of $6,000,000 appropriated for this purpose. Ex-service men engaged in farming are also given a state loan for "purchase of land, improvements and live stock to be placed on the land." The loan may be as high as 70 and even 90% of the value, and is payable on the instalment plan over a period of 30 years.

The governors since 1910, all Republicans, were Robert S. Vessey, 1909–13; Frank M. Byrne, 1913–7; Peter Norbeck, 1917–21; William M. McMaster, 1921– . (C. C.*)

SPA (*see* 25.525).—Pop. (1909) 8,293. The Germans occupied the town, which was undefended, on Aug. 4 1914, and it became first a hospital base and, later, a place of convalescence for their sick and wounded. The German Great G.H.Q. was transferred here from Kreuznach in March 1918 and the Kaiser fled from the Château du Neubois, 2½ m. E. of the town, into Holland on Nov. 8 1918. His concrete dugout at the château is preserved intact and shown to visitors. A conference of the Supreme Council of the Allies was held at Spa in July 1920.

SPAIN (*see* 25.527).—At the census of 1910, the total pop. (including the Balearic and Canary Is., as well as the territories of Northern Africa, but not those of the Guinea Colony) was 20,364,392, giving a density of 34·49 per sq. kilometre. The maximum density corresponds to the province of Biscay (161·59 per sq. km.) the minimum to that of Lerida (23·45). Figures above 100 per sq. km. are given by the province of Barcelona (148·46); Guipuzcoa (120·28); Pontevedra (112·80), and Madrid (109·80). There are only eight towns of more than 100,000 inhabitants, namely, Madrid (599,807), Barcelona (587,411), Valencia (233,384), Seville (158,287), Malaga (136,365), Murcia (125,057), Saragossa (111,704), Cartagena (102,542). The birth-rate varied between 2·83 and 3·08 per 100 inhabitants for the period 1914–9, 0·16 per 100 inhabitants being illegitimate. The marriage-rate fluctuated between 0·65 and 0·67 per 100 inhabitants during the war years, and made a sharp rise to 0·81 in 1919. In the same period the death-rate varied between 2·13 and 2·31 per 100 inhabitants, with an exceptional rise to 3·31 in 1918. Infant mortality is very high, being 20·20% of the total of deaths for infants of less than one year, and 16·73 between one and four.

Education.—There were in 1910 59·35% people who could not read (figure including and referring to all ages). In 1919, 51,815 youths (of which 3,730 were females) were studying in secondary schools. In the same year 23,660 students were inscribed in the 11 universities of the country. This figure does not include numerous special and technical colleges, catering for certain professions such as architecture, engineering, veterinary science, etc., or the numerous agricultural, and arts and crafts, schools financed by the Government, municipalities and provincial councils.

Agriculture.—Some progress is shown in area and production. Wheat crops oscillate near an average of 3,265,000 tons and reached their maximum at 4,145,751 in 1916. The wheat area averages 3,809,464 hectares. Barley shows greater fluctuations with an average of 1·5 million tons. Maize keeps close to its average of 0·6 million tons, while oats remain at 0·4 million tons. Vineyards suffer from parasitic trouble, and the area planted diminished gradually from 1905 (1·4 million hectares) to 1914 (1·2) then began to grow again, but without reaching its previous value. Yet the maximum crop corresponds to 1917 with over 4 million tons, of which 3·8 million were transformed into wine and produced 23·7 million hectolitres. The olive area grows steadily, and reached 1·6 million hectares in 1918. The maximum crop corresponds to 1911 with 2·2 million tons of olives, of which 2·1 were transformed into oil (0·4 million tons). The average figures are about half. Sugar, both cane and beetroot, is cultivated, but while cane decreases, beetroot shows an irregular increase in area (36,741 hect. in 1911, 66,000 in 1918). This increase does not, however, correspond to a similar increase in production. The best year was 1913, with 1·3 million tons, and the worst 1918, with 0·672 million tons. While the average value of the annual agricultural production of the country in 1903–7 was estimated at 3,824,394,425 pesetas (£152,975,777), it was valued at 7,975,623,025 pesetas (£319,024,921) in 1916. A growing tendency is manifest towards the use of mechanical implements, of which there are several manufacturers in the country. More important machinery is imported, mostly from America.

Mining.—Mining was much stimulated by the war, the high price of coal having allowed the working of deposits which would not have been economically workable in normal conditions. Some Spanish products played an important rôle in the war; thus, pyrites were in high demand. The total value of the production of Spanish mines passed from 453 million pesetas in 1910 to 1,323 millions in 1917.

Railways.—There are 14,902 km. of railway lines, of which 11,378 are normal and 3,524 narrow gauge. In 1918, the number of persons conveyed rose to 75,480,648, or an average of 206,796 daily. In the same period the transport of goods rose to 35,244,659 tons. Gross receipts amounted to 557,931,445 pesetas, or 37,060 per kilometre.

Pre-war and after-war traffic figures are as follows:—

	Persons	Goods (tons)
Pre-war average	50,350,000	29,090,223
1920	84,300,000	35,351,920
Increase	33,950,000	6,261,697

When war broke out, the Spanish railways were going through a crisis of growth, the traffic of the country having developed in excess of the railway plant, while the companies found themselves too near the date when they had by statute to revert their lines to the State, to be able to borrow money on good terms. The war aggravated this situation by all but stopping coast-shipping. Since then, a great increase in salaries and wages, as well as the rise in the price of coal and materials, has completely upset railway finance. An increase of 15% in rates was allowed after much opposition, and another is proposed which public opinion refuses to countenance. Several schemes are afoot to cope with the difficulty, all of them including a greater or lesser measure of State interference.

An electric railway line is proposed to link Dax with Madrid and Algeciras, by means of a French-gauge line, to be linked up in the future with Moroccan lines. This scheme is subordinate to a general scheme for the harnessing of water-power in the whole peninsula, through the construction of hydro-electric stations and a polygonal distribution line. A further advantage of the scheme would be that the numerous deposits of second-rate fuel existing in the peninsula would then be economically exploited in the production of electricity.

Merchant Marine.—Despite heavy war losses, the merchant fleet was in 1920 slightly larger than in 1914. The figures for 1920 were:—

		Ships	Tons
Sail	more than 500 tons	38	53,906
	less than 500 tons	516	60,639
Steam	more than 500 tons	379	840,007
	less than 500 tons	259	52,640
Total		1192	1,007,192

This represents an excess of 318 sailing vessels with 81,575 tons and 10 steam vessels with 48,325 tons over 1914.

Industry and Commerce.—The war gave great stimulus to Spanish industries. Though many enterprises born out of the artificial conditions created by an exceptional Allied demand died out with the peace, progress is to be observed, particularly in Catalonia, Biscay and Asturias. Thus, while in 1905 there were in Spain 775 business corporations with an aggregate capital of 5,633 million pesetas, there were in 1916 no less than 2,435 of such corporations with a capital of 9,456 million pesetas. The average value of foreign trade for the pre-war period was about 2,250 million pesetas, or 112.90 pesetas per head. The war radically altered the *régime*. The commercial balance was against Spain in 1911. An excess of imports over exports, which had reached 150·5 million pesetas in 1900, fell to 3·6 in 1904, exceeded 100 millions in 1905 and 1906, fell to 2 millions in 1907, and varied between 16 and 75 millions in the following years, while in 1912 there was a 10·6 million excess of exports. 1913 and 1914 saw high excess of imports again (229 and 170 millions), but after the war *régime* began in 1915 Spain registered in 1918 her maximum favourable balance, amounting to 338 million pesetas. Considerable imports of gold and silver tended to neutralize this figure in the total commercial statistics. The value of the peseta rose accordingly (see Exchange, Foreign).

Banking.—The Bank of Spain increased its gold reserves considerably. From 576 million pesetas in 1914, they grew to 2,415 million pesetas in 1919. Banks developed in all parts of the country, and, with the end of the war, a general invasion of foreign banks was also to be observed. English banking, which till then had not seemed to be interested in the peninsula, appeared in Spain, and now forms an important feature in Spanish business, not only in Madrid, but in Barcelona, Valencia, Seville, etc.

Finance.—The Budget shows an increasing deficit due mostly to two causes: on the expense side, an increase in numbers and salaries of the bureaucracy; on the receipt side, a failure to reorganize taxation on a sound basis of direct taxes. If 1909 be taken as a unit (100), expenditure grew steadily up to 168 in 1918, while receipts grew to 134, including Treasury bills. The actual figures in pesetas for 1920–21 were:—Expenditure, 2,403,730,313.69; receipts, 1,842,720,570.32; the deficit being 561,009,743.37. The Public Debt, which had diminished by 2,000 million pesetas in 1910, had reached its previous amount again in 1918, and in 1920 was 11,926,295,232 pesetas.

Canalejas Ministry.

History.—The closing months of 1910 were occupied by important legislation carried on by the Canalejas Government. The "padlock" bill, forbidding the settlement of further religious communities in Spain until the negotiations with the Vatican were completed was carried in the Senate (Nov. 4) and a compulsory service bill introduced while the Chamber discussed a Municipal Taxation Reform Bill with a view to the suppression of the unpopular *octroi*. Meanwhile, Señor García Prieto, after laborious negotiations, brought to a head the Spanish-Moroccan Agreement, which was signed in Nov. (*see* Morocco). The Agreement was well received by all political parties except the extreme Left. A bill was introduced and passed, regulating work in the mines; a moderate measure but a step in the right direction. An important political event, the breaking up of the Republican-Socialist block which had been created under the Maura-Cierva reactionary administration, was brought about unexpectedly by a debate on the Barcelona water supply. Señores Azcárate, for the Republicans, and Iglesias, for the Socialists, having expressed their disapproval of the action taken in the matter by Señor Lerroux and his radical followers, who controlled the municipality of Barcelona, a rupture ensued. Thus began the gradual weakening of the anti-dynastic Left, which continued in later years. The "padlock" bill was passed by the Chamber of Deputies on Dec. 22.

Señor Canalejas' Cabinet ended the year greatly strengthened by its vigorous legislative policy. Yet, on the last day of the year, the prime minister being desirous of reconstituting his ministry handed in his resignation, and the King having renewed him his confidence, the new Cabinet was sworn in slightly reconstituted. The crisis thus settled, the King visited Melilla (Jan. 7–13) amidst scenes of great enthusiasm, France being represented by Gen. Toutée and by the warship "Du Chayla." Rumours of a Spanish intervention in Portugal began to circulate then but were promptly met by a strong denial from Señor Canalejas himself. This second Ministry lasted till April 3. Its main efforts were spent in securing unanimity for the negotiations with the Vatican, the most important point of which was the drafting of a new Associations Bill to apply to religious as well as to ordinary communities or societies, the Vatican refusing to renew negotiations unless the Spanish Government agreed to submit its bill to the approval of the Holy See. Señor Canalejas naturally resisted such a condition.

Associations Bill.

The Ferrer Case.

The Government was somewhat weakened by the attacks of Señor Urzáiz and Señor Azcárate on its financial policy particularly on their bills for the reform of the Public Debt and for certain alterations in the working of the Bank of Spain. But the end came from another quarter. A debate on the Ferrer case (*see* 25.568) gave rise to an extremely grave crisis. An outspoken speech by Don Melquiades Alvarez was answered by Señor Canalejas in a half-hearted way, which did not sufficiently conceal the fact that the prime minister was not far from agreeing with the opponents of the military court which had sentenced Ferrer. A deep discontent was soon manifest in the ranks of the officers of Madrid, and the War Secretary, Gen. Aznar, intimated that in his opinion the debate should be closed at once. Señor Canalejas submitted the resignation of the Cabinet to the King, who renewed his confidence to his prime minister. The new Cabinet appeared before the Cortes, and the debate on Ferrer's case was proceeded with in a somewhat cooler atmosphere. The incident was, however, typical as a forerunner of much that was to come in future years.

Morocco Crisis.

The attention of Parliament was soon diverted towards Moroccan affairs. The French were preparing their advance on Fez, a fact which forced Spain to an active policy in order to maintain her much diminished rights in Morocco. The first signs of this policy were received with ill humour by the French press, and a press duel began then between the two nations which was to last to the very eve of the World War. Meanwhile the Government had introduced its long expected Associations Bill (May 8), which provoked a protest from all the archbishops and bishops headed by the primate. The Government were successful in passing the bill for the suppression of the *octroi* (May 22). This success initiated a campaign of active opposition from the Conservatives, the aim of which was to defeat the bill in the Senate, but the plan failed, for the bill was passed by the Senate by 178 to 63 (June 3). The fact was significant of the amount of determination exercised by the Crown, for if it had not used its influence over the non-elective part of the Senate the Government would have been defeated by the Conservative vote.

The Government, meanwhile, in the teeth of popular opposition, rendered more dangerous by several strikes, was sending troops to Morocco and preparing for events. On June 9, Spanish troops landed at Laraish, thus putting France before a *fait accompli* which was not much to the taste of the Quai d'Orsay. France, however, was prevented from taking any strong action by the sudden arrival of the "Panther" at Agadir, but a certain tension prevailed between France and Spain all through the summer. At the same time, popular opposition to the war, not only to that which was going on in Morocco but to that which it was feared was going to break out in Europe as well, was spreading, and tended to encourage the extreme parties. Meetings took place in Barcelona and Madrid, this last one being stimulated by the presence of two French "comrades"; and a Republican rising plotted by the lower deck of the cruiser "Numancia," though unsuccessful, startled public opinion. The movement seems to have been connected with political efforts to overturn the monarchy, which were being prepared on land.

Labour Troubles.

The greatest danger, however, was to come from a campaign of strikes which began early in the year. In Sept., nearly all these strikes still dragged on, and their effect was further aggravated by the feeling that the Government was attempting a big operation in Morocco behind the backs of the people. Grave disorders occurred in the Bilbao district, where 20,000 steel smelters went on strike, and the situation developed soon into a general strike, which spread to the coalfields of Asturias. The Government, which at first seemed inclined to favour the workers for the sake of national conciliation in view of the international situation, gradually veered round. They began by suspending the constitutional guarantees in Biscay (Sept. 12); then, on receipt of grave news from Asturias, in the whole of Spain (Sept. 19). By this time, the movement had spread to nearly the whole peninsula, and grave disorders had occurred in Catalonia and Valencia, notably in Cullera, where a magistrate was mobbed to death. The Government met the situation with coolness and resolution, and by Sept. 22 the strike fever had abated upon the settlement of the Bilbao strike.

Morocco: Tension with France.

General Luque himself, though then a War Secretary, was sent to Morocco to preside over the operation, which began successfully on Dec. 6, but collapsed a few days later after a gallant attempt to force the passage of the River Kert. The Spanish press voiced a belief, then current in the Spanish army, that the Moorish tribes were provided with French arms and ammunition, and the imprisonment by the French Gen. Toutée of several French officials in Ujda gave some colour to this view, much resented though it was by the French press. General Luque, though in a veiled manner, suggested in an interview to the press that his failure had been due to lack of French coöperation. Under such unfavourable conditions began the negotiations for a Franco-Spanish agreement following upon the Franco-German Treaty on Morocco. The Spanish troops were soon attacked on the River Kert, and rumour attributed the move to French initiative. The matter had to be smoothed over by the Foreign Secretary, Señor García Prieto (Dec. 28).

Cullera Rioters Reprieved.

During the first days of the new year the case of the Cullera riots came before the military supreme court. The court pronounced seven death sentences, and a press campaign started at once for the reprieve of the seven condemned men. Señor Canalejas seized the opportunity to make the King benefit by the popularity which always follows acts of clemency. He brought his Cabinet unanimously to agree that six out of the seven men should be reprieved, but that the seventh, the head of the riot, known as *El Chato de Cuqueta*, could on no account be recommended for mercy. He then allowed King Alphonso to be besieged by petitioners, including the old mother of the doomed man, who was granted a special audience, so that the King might be provided with an excuse for reopening the affair. Thereupon, Señor Canalejas agreed to reprieve *El Chato*, but resigned. Though the resignation was purely formal, the King took for himself all the merit of the act of clemency, and a wave of popular gratitude was his reward. Thus by a mixture of mercy and ability, Señor Canalejas reversed in 1912 the position which Señor Maura had created by his uncompromising policy of 1909, and this incident did much to harden Señor Maura in his attitude of "*implacable hostilidad*" to the Liberal party.

Canalejas Cabinet Reconstructed.

Much of the parliamentary session was spent in the usual recriminations wherewith the Conservative party endeavoured to weaken Senor Canalejas' position, and on March 11 Señor Canalejas had to sacrifice several of his colleagues, notably his Minister of Public Works, Señor Gasset. The King renewed his confidence to Señor Canalejas, and the new Cabinet was reshuffled. The inclusion (as Minister of Education) of Señor Alba, known to be a personal follower of Señor Moret, was considered as a token of reconciliation between Señor Canalejas and his former chief. Señor Canalejas seized the opportunity afforded him by this crisis to adjourn Parliament until May 1.

Reformist Party.

Local Government Bill.

The salient feature of this interval was the launching of the Reformist party by Don Melquiades Alvarez, a moderate Republican working in close touch with Señor Azcárate and Señor Perez Galdós. In a first speech delivered on April 7, Señor Alvarez announced the formation of a Reformist party which would reconcile the moderate elements of the middle classes with Republican ideas. This was but the beginning of an evolution which was destined to bring a certain important portion of Republican opinion into the fold of the monarchy. On May 1 the Cortes was reopened and an agitated parliamentary session began, in which the main question in debate was the bill called "De Mancomunidades." This bill was a sop given by Señor Canalejas to Catalan opinion, for it allowed *Diputaciones* (elected provincial councils) to unite into groups for purposes of common administration, a measure which, though in appearance of a general character, was meant to enable the four Catalonian provincial councils to unite into a kind of local parliament. The bill caused a deep cleavage in the ranks of the Liberal party. General Weyler, Señor Montero Rios (president of the Senate), Señor Moret, and Count Romanones (president of the Chamber) were all emphatically against it. Senor Canalejas' difficulties were increased by the fact that, though the measure formed a part of a more ambitious Local Government Bill devised by Señor Maura during his last term of office, Señor Maura opposed it on the ground of its having been as it were taken from its context. Yet Señor Canalejas piloted his bill successfully through a hostile Chamber, and when, on July 5, he had the Cortes adjourned, the bill had been virtually passed. He, however, avoided a final vote, knowing that, on the bill appearing before the Senate, Señor Montero Rios would resign. His triumph was therefore more apparent than real.

Period of Great Strikes.

Murder of Canalejas.

Treaty with France.

With the summer a period of strikes set in. Saragossa, Málaga and the mining and steel-smelting district of La Felguera (Asturias), became restive with social strife (August). Reus, Madrid and Murcia also suffered from partial strikes. But all these conflicts were soon overshadowed by a grave railway strike which affected nearly the whole country. Señor Canalejas met it by applying Art. 221 of the Recruiting Law, which in cases of danger or abnormal circumstances allows the drafting into military service of all men of military age working in industries of public importance; and this measure, combined with a really conciliatory policy, caused the collapse of the strike on Oct. 5. On Oct. 14 the autumn session of the Cortes began, and three days later the bill "De Mancomunidades" was passed in the Chamber, but the work of the session was suddenly brought to a close by the murder of Señor Canalejas on Nov. 12. The prime minister was shot dead in the Puerta del Sol (Madrid) in broad daylight, while he was inspecting the books at a book-shop window. The emotion aroused by the crime was enormous. The King, with his usual impulsiveness, hurried to the Home Office, where the body had been laid, in the first carriage which he found at his disposal; then, on the day of the funeral, he walked in person at the head of the mourners, through the streets of Madrid. This brought him great popularity. Meanwhile, Count Romanones had replaced Señor Canalejas at the head of the Government, with the definite task of passing the budget and of completing the treaty with France. On Dec. 27 this treaty was signed, after laborious negotiations which had begun on Dec. 6 1911. The discussion of the treaty occupied the remainder of the session, which Count Romanones closed at Christmas.

Romanones Government.

Having thus fulfilled the programme for which he had been entrusted with the seals of office, Count Romanones gave the King an opportunity to alter his policy by tendering the resignation of the Cabinet. The King, without consulting any of his statesmen, gave Count Romanones a new lease of power. This decision finally settled the question of Señor Canalejas' successorship to the direction of the Liberal party in favour of Count Romanones. Yet, his rival, Señor García Prieto, though bowing for the moment to the royal pleasure, signified his intention to stand for the leadership in the future by abstaining from a seat in the Cabinet, though coöperating with Count Romanones from outside. The Liberal solution of the crisis contributed further to increase the popularity of the King. The sensational withdrawal from public life which Señor Maura announced on Jan. 1 1913 worked in the same direction. In a lengthy note addressed to his followers he animadverted on the action of the King in having lent himself to a policy of coöperation between the Liberal opposition and the antidynastic Left. Señor Maura resigned his seat in the Chamber, followed by Señor La Cierva, and as these two names had symbolized reaction to the Spanish people since 1909, their withdrawal, in direct conflict with the King, enhanced the prestige of the Crown. Señor Maura's retirement was of short duration. On the 4th he saw the King; on the 10th he answered a message from his followers by accepting once more the leadership of the party.

Señor Alvarez, who meditated a *rapprochement* with the monarchy, made on this occasion a sensational speech, in which he had the courage to bestow great praise on the King at a public Republican meeting. Encouraged by the success of this first attempt, he spoke in the same strain in Murcia (Jan. 12) and obtained from his Republican audience an enthusiastic ovation for the King's policy. Nor did King Alphonso sleep on his laurels. On Jan. 14 he summoned to the palace for consultation the three most eminent men of Republican Spain, Señor Azcárate, head of the Republican-Socialist Coalition, and a respected specialist in labour questions, Prof. Cossio, a well-known pedagogist and art critic, and Señor Ramón y Cajal, the famous biologist. The significance of these interviews escaped no one, and least of all the Conservative Reactionaries. On Feb. 11, these interviews were the main subject of speeches delivered by Señor Azcárate and Señor Alvarez at a Reformist banquet in Madrid, the net result of which was the public recognition by these gentlemen of the fact that, whatever obstacles there were to the democratization of Spain, they did not come from the Crown. The meeting, a further step towards the monarchy taken by the middle-class and intellectual section of the Republican party, served to outline a scheme of conditions and constitutional guarantees which the Reformist party would require in order to coöperate with the Crown.

Count Romanones took a good share of whatever merit there was in this policy. The death of Señor Moret (Jan. 28) removed his most serious rival in the Liberal party. Count Romanones then endeavoured to persuade Señor Azcárate to accept the presidency of the Chamber, a clever move likely to reflect favourably on the prime minister, while avoiding the elevation of any would-be rival to the post considered in Spanish politics as the stepping stone to the premiership. Señor Azcárate refused, and Señor Villanueva was at last selected. The King's official visit to Paris, on completion of the Franco-Spanish treaty, had proved a success (May 6–9), and Count Romanones, having replaced Señor Villanueva by Señor Gasset as Minister of Public Works, felt strong enough to face the Cortes. But no sooner had he appeared before Parliament (May 26) than a speech by Señor Maura (28th) forced him to hand in his resignation. Señor Maura had merely re-stated his position of "*implacable hostilidad*" to a policy of coöperation with the parties of the antidynastic Left, and Count Romanones thought that no Liberal party could govern without a properly constituted Opposition, willing to take office on the fall of the Government. The crisis was again solved by the Crown in favour of the Liberal party. The King ratified the policy which Señor Maura had refused to countenance, and Count Romanones came back at the head of the same Government. But the discussion of the bill "De Mancomunidades," which at last had to come before the Senate, produced a still graver crisis, for it precipitated the division of the Liberal party, latent since the death of Canalejas. The group headed by Señor Montero Rios (president of the Senate), and his son-in-law, Señor García Prieto, dissented from that of Count Romanones on the principle of this bill, Count Romanones having accepted it as part of Canalejas' political testament. This difference of opinion brought about the resignation of the Cabinet (June 11). Despite insistent efforts from the King, no solution could be found to bridge over the difficulty; and on June 13, Count Romanones having failed to conciliate the non-conformists of his party, formed a Cabinet of personal followers, which aggravated the division. Parliament was indefinitely adjourned. The division in the party materialized in the formation of a García Prieto faction, and it was generally realized that the solution given to the crisis was a mere stop-gap, necessitated by the coming visit of M. Poincaré to Madrid.

Franco-Spanish Rapprochement.

The Government weathered several strike difficulties and had to face a troubled period of unrest in Morocco, where Gen. Marina succeeded Gen. Alfau as High Commissioner. A Franco-Spanish *rapprochement* was then initiated, with a visit of Gen. Lyautey to Madrid and of M. Barthou, the French prime minister, to San Sebastian, where he saw the King. All these movements prepared the ground for the official visit of M. Poincaré, then President of the French Republic, who arrived in Madrid Oct. 7. The President left Spain by way of Cartagena, where he embarked on the battleship "Diderot," Spain being represented by the battleship "España" and England by H.M.S. "Inflexible." Both the King and the President emphasized the fact that it was in Cartagena that six years earlier Spain, France and England had agreed on a common policy in the Mediterranean.

Señor Dato Prime Minister.

As soon as the summer holidays were over and M. Poincaré had left Spanish soil, the latent crisis which divided the Liberal party broke out again. The prime minister had to provoke it himself in the Senate. He was beaten (Oct. 25) and he resigned. The King then considered that the Liberal policy which he had consistently followed since Señor Maura's fall in 1909 was at an end. But he was not ready to follow Señor Maura in his uncompromising attitude, and he selected Señor Dato as a solution more acceptable to the democratic wing of the country. Señor Dato was unable to consult his chief on the King's offer, for Señor Maura had left Madrid for an unknown destination. He therefore accepted office (Oct. 27), being averse to leaving the Crown without the services of one of the two great historical parties. From this date, the Conservative party began to show open signs of division, and thus the second of the two great rotating parties, which Cánovas and Sagasta had created, began also to disintegrate. The first act of the new Government was to grant a decree giving validity of law to the bill "De Mancomunidades," a move directed to enlisting the sympathies of Conservative opinion of Catalonia. On the last day of the year, Señor Dato obtained from the King a decree dissolving the Cortes.

Opposition to the King's Personal Power.

The first half of 1914 saw the consolidation of the Dato faction of the Conservative party. The general election, which took place in the spring, yielded a sufficient majority, both in the Senate and in the Chamber. Moroccan affairs were the main subject of discussion in Parliament and press, and the King lost a good deal of the popularity which he had won under the Liberals on account of several incidents which, rightly or wrongly, were interpreted as acts of personal power and interference with the discretion of the Government in military matters. This opinion was strengthened by an uncalled-for decree, countersigned by Gen. Echagüe as War Minister, establishing the King's right to correspond directly with his army officers of all ranks. Yet the Reformist movement, which had gathered great momentum at a demonstration on Oct. 23 1913, when Don Melquiades Alvarez had defined its aims and limits, gained ground, ably helped by an intellectual group headed by Prof. Ortega y Gasset.

The international situation of Spain at the outbreak of war was defined by two sets of circumstances: official, and national or popular. The official situation was ruled by the Cartagena Agreement of 1907, confirmed by the conversations held in the same place in 1913 between M. Poincaré and Count Romanones. These agreements and conversations stipulated that "should new circumstances arise tending to alter the territorial *status quo*" in the Mediterranean or in the European and African coasts of the Atlantic, the three powers concerned (Spain, France and England) would "enter into communication" in order to take any measures that might be necessary. The war was obviously a "circumstance" falling within the limits of the above definition. Yet Spain did not "enter into communication" with France and England. But, contrary to what was generally believed at the time, her abstention was due to the fact that the two powers most interested in the matter, France and England, made no sign to set in motion the Cartagena Agreements. Faced with this situation, Señor Dato promptly declared for an absolute neutrality. This decision was based on a sound reading of the situation from its national and popular point of view. The violation of Belgium had given to the war an almost sacred character which the Allies emphasized to the full. Yet the fact did not escape Spanish public opinion that, though the defence of Belgium and the interest of the Allies were two coincident aims, they were not essentially one and the same "cause." Thus, while the generosity of England in rushing to the rescue of Belgium (and for that matter of France) was not denied, it was also realized that England had a strong national interest at stake which powerfully helped her to make up her mind. Now, such a strong national interest was entirely lacking in the case of Spain. Spain was in fact the only European nation which had no stake in the war. Add to this that the nation was divided as to its feelings. The working classes, the more numerous part of the intellectuals and most of the trading communities, were pro-Ally. The clergy, most of the army and of the bureaucracy and the "idle rich," were pro-German. The Moroccan negotiations had by no means improved the feelings of the Spanish people towards France. For the well-informed politician and publicist, France was the nation which treated with Germany and with England as if Spain did not exist, and turned round afterwards to make Spain pay what she had had to pay in Berlin or in London. For the clergy, France was the atheistic republic, the scarlet woman of the West. For the army, France was the ever-watchful rival in Morocco. For all of them, England was a nation whose dominating principle in foreign affairs was the increase of British power. Thus, the country was split into a reactionary and conservative pro-German wing and a democratic or "advanced" pro-Ally wing, and, as this division was real, and not fictitious as were the party groups, it cut across the parties. So-called Conservatives such as Señor Sánchez de Toca, so-called Liberals such as Count Romanones, sided with Reformists and Republicans on the pro-Ally side, while Liberals such as Señor Villanueva and Conservatives like Señor Besada led the pro-Germans.

Policy of Neutrality.

On one definite point everybody agreed. Spain was to keep out of the war. There were only two exceptions, more apparent than real. Señor Lerroux, the leader of the Catalan Radicals, advocated participation in the war on the side of the Allies. But he spoke without responsibility, as a man who knows that he can make capital out of an opinion which he is perfectly sure he will never be in a position to carry into practice from office. The other case was more serious. On Aug. 10 *El Diario Universal*, a paper known to reflect the opinions of Count Romanones, published an article under the title of "Deadly Neutralities," which in a veiled manner advocated participation in the war on the side of the Allies. It created a great sensation, for it was attributed to Count Romanones himself, and it is certain that, if not written by him, the article was concocted under his direct inspiration. As events were to show, it was only meant as a *ballon d'essai*, and, after a short period of press agitation, was forgotten.

War Legislation.

The Government concentrated their activity on the organization of the country for the new situation created by the war. A "Committee of Initiative" was created for the study and coördination of national and private efforts to deal with war problems, and this Committee was put under the chairmanship of Señor La Cierva—a move to attract this important political figure to the Datist side of the

Conservative party. Parliament resumed its sittings on Oct. 30 and unanimously endorsed the foreign policy of the Government. The country was meanwhile recovering from the first shock of the war, getting used to abnormal conditions, and even beginning to realize that there might be some material profit to be made out of it. The pro-German press raised frequent protests against the enormous increase in exports to France which the Customs reported. Metals, raw and manufactured, clothes and boots, all kinds of foodstuffs, horses and mules, poured into France, under the "neutral" eye of the Government. Before adjourning the Cortes, however, the Government introduced and passed a bill which gave them special powers to deal with such matters as customs tariffs, railway rates, State purchases of food, shipping and expropriation of foodstuffs. A navy bill was also passed, authorizing the building or purchase of 4 fast cruisers, 6 destroyers, 28 submarines, 3 gun-boats, 18 mine-laying and auxiliary ships, mines and submarine defences, aircraft, and several important naval land works in Ferrol, Cadiz and Cartagena. The Foodstuffs Act did not prevent a period of serious unrest in the spring, due to the scarcity artificially created, partly by excessive exports, partly by speculative holding up of stocks. Special Juntas, composed of the civil governor, the financial delegate and the mayor of the provincial capital, were set up in each province to administer all available stocks of food, and a policy of prohibition of exports was even initiated in March (1915). Yet the great increase in exports had contributed perhaps more than any other cause to the rise in the value of the peseta, a rise which gave the Government an opportunity to repatriate the Public Debt, *i.e.* enacting that all Spanish Government stock held by foreigners which was payable in francs or sterling should become payable in pesetas in the Spanish market.

German Propaganda.

Though the Cortes was closed, great political activity was displayed, by all parties, with a view to a consolidation of the loose political forces of the day into that symmetric form of two rotating parties the need of which seemed to be felt as a habit by all concerned. This activity, which the Government had driven towards the press and public meetings by closing Parliament, was stimulated by an active German propaganda, soon to be imitated by similar endeavours on the part of the Allies. The mouthpiece of extreme pro-German views was Señor Vazquez de Mella, an eloquent and versatile Carlist professor and M.P., who on May 31 pronounced a strong pro-German speech in the Zarzuela theatre (Madrid), before a house full of Germans, Carlists and Maurists, and adorned by the presence of a cluster of aristocratic ladies, many of whom belonged to the Queen's household. But though the excitement produced by this and similar outbursts of partisan feeling did not go very deep, and though the mass of the people were not swayed out of the attitude which they had spontaneously assumed, the Government thought there might be some danger in liberty, and they decided to deny all permits for meetings on neutrality and the war. Despite many complaints, for the measure was obviously illegal, the Government held fast to their decision.

Financial Crisis.

It is worth noting that while this protest from all political groups, including the two sections of the Liberal party headed by Count Romanones and Señor García Prieto, failed to shake the power of the Government, a crisis was precipitated on the refusal of the business community to coöperate with the Government in the launching of a loan. The Finance Minister, Señor Bugallal, prepared an issue which was expected to yield 750 million pesetas (£30,000,000); 283 of which were already covered by exchange for an equivalent sum in short-term bonds. The new money to be found did not therefore exceed 467 million pesetas, or a little over 19 millions sterling. Now, of this sum, no more than 52 million pesetas (just above 2 millions sterling) was subscribed, and it was noticed that small subscriptions far exceeded the sums subscribed by big owners of capital. Several explanations were put forward, but the main cause of the failure seems to have been a reluctance of business circles to subscribe under conditions which were not considered generous enough for the subscriber. The resignation of the Government (June 22) as a result of this failure was quickly followed by a reinstatement of the same Cabinet, despite the insistent desire for retirement manifested by the Minister responsible, Count Bugallal. The situation of the Treasury was by no means flourishing. The estimates for 1915 had been set at 1,465 million pesetas against 1,281 million pesetas revenue. But as months went by, both sides of the account showed signs of moving in the wrong sense. The liquidation at the end of the year was to show that revenue would remain at 1,202 million while expenses, not including Government purchases of foodstuffs, were to rise up to 1,556 million. The Government had to fall back on Treasury Bonds negotiated through the Bank of Spain.

Industrial Prosperity.

The difficulties were of course of a purely administrative order, for the work of the country was in full swing under the stimulus of war orders. As one sign of this growing industrial coöperation between Spain and the Allies, the shipowners announced to the Government (Aug. 1915) that the premiums granted them by the Shipping Acts as a measure of protection were no longer necessary and would not be cashed. This was, of course, but a euphemistic way of hinting that such premiums were no longer worth the sacrifice which they entailed of the shipowner's liberty to trade as he pleased between foreign ports. Great shipping profits ensued, and torpedoings followed. On Aug. 17 the s.s. "Isidoro" of Bilbao was sunk by a German submarine. On Aug. 20 the s.s. "Peña Castillo" of Santander sank in obscure circumstances. Public opinion was divided as to the right attitude to take in these circumstances, and while it was generally recognized that some sort of protest should be made, the free hand claimed and obtained by shipowners for the carrying on of their highly profitable industry was a serious handicap to their case.

Fall of the Dato Government.

Though the war absorbed most of the political interest of the day, several efforts were made to reunite the Liberal groups into one party again, and these efforts having failed, owing mainly to the unwillingness of either leader to surrender his claims to the leadership of the whole, Count Romanones, the more active of the two, prepared a plan of campaign against Señor Dato's Government on the Military Reform Bills then being prepared by the War Secretary, Gen. Echagüe. General Echagüe introduced his bills, and Señor Dato declared that the Chamber would have to pass them before discussing the budget. Count Romanones was adamant against this condition imposed by a Government which had kept Parliament closed for the best part of the year, and the Government fell on Dec. 6.

Romanones Cabinet of Reunited Liberals.

This crisis is worth recalling for it marked a further step in the approximation of Don Melquiades Alvarez to the monarchy. King Alphonso having expressed a wish to hear Señor Alvarez' opinion along with that of the leaders, the chief of the Reformist party called at the royal palace for the first time. The crisis ended in the formation of a united Liberal ministry (the two groups having melted into one as they came nearer the warmth of office). Count Romanones took the premiership, and, in order to counterbalance the effect of his well-known pro-Ally views, assigned the Foreign Office to Señor Villanueva, a notorious pro-German. Señor Barroso (Justice) and Señor Burell (Education) represented the García Prieto faction. Señor Urzáiz, an independent and outspoken Liberal, went to the Exchequer, probably at the suggestion of the King, who also caused Admiral Miranda, though a Conservative, to remain at the Navy Office. General Luque came back to the War Office, and Senator Salvador was appointed Minister of Public Works.

The programme of the Government was very much the same as that of its predecessor: neutrality, military bills, financial and economic reforms, and the budget. In a sense, the inclusion of Señor Urzáiz, who, though a Liberal, was a party unto himself, and of Adml. Miranda, a Conservative, initiated the period of mixed ministries, which was about to open as a logical consequence of the gradual weakening of the old parties, and in its turn would accelerate the process of their disintegration. The experiment, so far as Señor Urzáiz was concerned, proved a failure. A man with a strong will and little adaptability, he came into conflict with his chief and was dismissed before he had time to resign (Feb. 25). The union of the two branches of the party which this Cabinet consecrated was apparent. Apart from the underlying cleavage between the García Prieto and the Romanones groups, the party showed further signs of division owing to the rising ambitions of Señor Alba, who by a clever use of the opportunities of his new office, made for himself an enviable reputation of a bold democratic tax-legislator. His bill on war profits aroused the opposition of all the minorities except the socialist. Yet Count Romanones, with a fine political *flair*, backed his Finance Minister. The matter, however, was purely political, for the bill had not been passed when the Cortes was closed, a general railway strike having suddenly upset all Government plans on July 13. Count Romanones faced the conflict with an unusual luxury of precautions, constitutional guarantees were suspended in the whole peninsula, and martial law declared in Madrid. But the strike was over one week later, and the autumn session was too deeply occupied in the discussion of Señor Alba's ambitious budget schemes to think of the War Profits Bill. The discussion of these schemes dragged on till Dec. 19, when it was resolved to validate the old budget for the coming year, while the new one was further discussed. The Government reappeared before the House on Jan. 19, but in the meantime Count Romanones had resigned and accepted office again with the same ministry. This curious crisis (Jan. 9) was probably devised by the prime minister as a means to recover from the King the moral authority which some thought he had lost at the hands of the pro-German press, which accused him of drawing great profits as a business man from his foreign policy as a prime minister.

Resignation of Romanones.

Count Romanones wore his neutrality with a difference, and, though the inheritor of Señor Dato's policy, he did little to conceal his pro-Ally views. The natural development of the war made every day more urgent the need of defining a policy which would be something more than a mere passive attitude. By Sept. 1916, Spain had lost more than 30,000 tons of shipping by torpedoing, and more than 50,000 in circumstances which were, to say the least, obscure. The shipping interests asked for Government help. A period of Government activity set in, during which Count Romanones was loyally seconded by Señor Gimeno, a pro-Ally Foreign Secretary, but the pro-German press countered by a fierce personal campaign against the weakest flank of the Government, the prime minister's industrial interests. On Jan. 31 Germany sent in a note establishing an "absolute blockade" of the Allied coasts. Count Romanones was committed to a policy which implied a firm answer to such a note. He gave it, for, though somewhat watered down by his pro-German colleagues, the Spanish note of Feb. 6 signed by Señor Gimeno was a well-worded protest against German methods with neutral rights. But the prime minister was too shrewd a politician not to realize that this firmness meant nothing unless backed with the will to fight if necessary, and that public opinion would not follow him so far. He therefore resolved to leave the Government there and then, at the top of the wave of his own policy.

Social-Political Upheaval.

Other considerations of home policy were perhaps not altogether without effect on his decision. A dangerous social-political upheaval was taking place under his eyes. In March and April, a serious strike situation developed in Madrid and Valladolid, which necessitated this second town being declared in a state of siege. In Barcelona, a military conflict, which was fundamentally to alter Spanish politics for years to come, was beginning to make itself felt. When on April 20 Count Romanones resigned, he took the easiest path. His fall, however, cost him the leadership of his party, the majority of which, somewhat frightened at his bold foreign policy, turned towards Señor García Prieto, while Señor Alba consolidated a separate group. The new Ministry, under the premiership of Señor García Prieto, was frankly neutralist, and Germany rightly interpreting the position felt freer to intensify its submarine campaign. But the Government had to concentrate on a far graver problem, the situation created by the so-called Committees of Defence. The artillery and engineer officers had been organized for years past into a Committee of Defence, the main object of which had been the maintenance of certain standards of professional honour and of certain rules of comradeship as to promotions, etc. The infantry officers had no such organization, their *esprit de corps* being less developed. But towards the middle of 1916, a system of infantry Committees of Defence had appeared, which soon evinced a tendency to claim authority over the army, and to interfere with the Government in such a manner that towards the end of the year, Count Romanones, then in office, insisted on their dissolution. Despite the reassuring reports of Gen. Alfau, Capt.-General of Barcelona, the headquarters of the organization, the system continued, a situation which was not altogether unconnected with Count Romanones' eagerness to resign in April 1917. General Aguilera, the War Secretary in Señor García Prieto's administration which then took office, was frankly averse to the Committees, and ordered the leaders to be arrested. A reserve Junta had been prepared, which stepped into the shoes of the arrested officers, and the conflict was only aggravated. General Alfau was dismissed and General Marina sent in his stead. But meanwhile, probably owing to royal hints, a less disciplinarian line of action was taken, and the arrested men were released. It was known later that an ultimatum had been placed in the hands of Gen. Marina, with a time-limit of 12 hours (June 1). Not unnaturally, the Government resigned. Count Romanones having refused to support any Liberal situation which would recognize the Committees, Señor Dato was called to office, and on June 9 the Liberal party ended a short spell of office during which its disintegration had rapidly advanced. Señor Dato's Government capitulated before the Juntas and accepted their regulations in full.

Dato Again Prime Minister.

This victory of a movement which, in its essence, was revolutionary, had an immense effect on immediate events as well as on the political evolution of the country. The revolutionary ferment was stimulated. A state of excitement and hope—due to the plausible, high-spirited language of the Juntas—spread over the revolutionary Left. The more responsible elements of advanced politics thought it necessary to give a lead to this popular spirit. Political manifestos asking for a renovation in Government and Constitution followed each other (Socialists June 12, Catalanists June 16, Left-Coalition June 16). All but three of the deputies and senators for Catalonia met on July 5 at Barcelona, and passed a resolution asking for an immediate meeting of the Cortes, and declaring that, should the Government refuse to comply with this request, a meeting of all the deputies and senators composing the Cortes would be called at Barcelona on July 19. The Government refused to recognize the right of the Catalan representatives to dictate its policy, and made it known that should the Assembly meet on the 19th it would be considered as rebellious and treated as such. The Assembly met, 13 senators and 55 deputies attending, including all the Socialist Republican and Reformist members of the Cortes, and, before the Civil Governor dissolved it by (formally) arresting one by one all its members, it voted conclusions asking for a reform of the Constitution, and set up three commissions to prepare reports on reforms to be submitted to a second meeting to take place later. At one moment, it looked as if these 68 men would take the lead of the revolutionary spirit which the bold action of the army officers had stirred in the country. But the mass of the Assembly was too dull, and no real leader manifested himself in it. Thus two attempts, one military, one middle-class, both directed against the evils of the old *régime*, failed through lack of coördination and mutual understanding. A third attempt, and a third failure, was still to come. On Aug. 2 the railwaymen of the Northern railway announced a strike. Though at first the men appeared desirous of a settlement, neither the Government nor the company succeeded in

The General Strike.

avoiding the strike, which began on the 10th. On the 12th, a general strike was suddenly launched in the whole country. It was clearly revolutionary, and aimed at the overthrow of the monarchical system and its replacement by a more or less socialistic republic. The country was declared in a state of war. Riots of a grave character took place in nearly every important town and industrial district of the country, and the military, which had been entrusted with the situation, crushed the rebellion with a ruthless hand. This revolutionary onslaught was somewhat aimless and impulsive, yet the period of street fighting lasted a whole week. By Aug. 9 the situation was well in hand. The net result was to prove that the only real force in the country was the Army Committee system.

Power of the Committees.

García Prieto Coalition Government.

On Aug. 10, the Council of Ministers passed a special credit for military expenses, implying an extension and renovation of several important services. The Juntas, conscious of their strength, encroached further and further upon the administration of the War Office, and even asserted themselves in the field of civil politics. Their first victim was Marshal Primo de Rivera, whom they practically forced to leave the War Office. Then the scandal became public, on the Government having lifted the censorship. The Committees attempted to deliver a message into the hands of the King, and a period of intense political excitement ended in the fall of Señor Dato, who had to resign on a "perfectly constitutional" hint by the King. In point of fact Señor Dato was expelled by the Army Committees. The crisis was long and laborious, and in the midst of it, the Parliamentary Assembly met in Madrid (Oct. 30) in order to hear the reports prepared by the three commissions appointed in its first sitting. Speeches were pronounced by Señor Cambó and Señor Alvarez, which were addressed rather to the King, then in consultation with political leaders, than to the Assembly. Both leaders declared that they would not accept office in a Government which would not be ready to adopt the conclusions of the Assembly, involving some democratic changes in the Constitution. But while Señor Alvarez held fast by this declaration, Señor Cambó allowed two of his followers to enter the Cabinet which was at last formed by Señor García Prieto. This Cabinet was a Coalition ministry in which, in order to give satisfaction to the new demand for an impartial general election, a non-political judge was given the post of Home Secretary. It was composed of Maurists, Liberals and Catalanists. Señor La Cierva, who took the War Office, was the real head of the Cabinet. His policy consisted in ingratiating himself with the Committees of Defence, so as to become their leader and representative.

An incident which occurred early in the year (Jan. 3) showed the extent to which the revolutionary action of the Juntas had affected the army. The N.C.O.'s, it was suddenly found out, had formed a Committee of Defence and were threatening to take action unless their claims were satisfied. Señor La Cierva had no difficulty in applying to them, with the blessing of the Officers' Committees, those drastic measures which the Officers' Committees had themselves deserved. Nor was the system of Committees of Defence limited to the army. Juntas were soon formed by the civil servants of nearly all Government departments, and on Jan. 12 1918, on the occasion of a difference between the Postmaster-General and his subordinates, an agitation began which was ultimately to cause the downfall of the Government. On Feb. 21 the telegraph officers went on strike—by meticulously carrying out official regulations.

Señor La Cierva and the Committees.

Ministry of "All the Talents."

On Feb. 24 the general election took place in these abnormal conditions. For the first time a Coalition Government presided over an election, and great hopes were entertained as to the result. The new Chamber, however, was but an average of the preceding ones, different only in that no party in it had a clear majority. Señor La Cierva began then to act as the self-appointed leader of the Committees. He first provoked a crisis (Feb. 27) so as to get rid of his Catalanist colleagues, Señores Ventosa and Rodés, who would have been obstacles to his plans, and having accepted their replacement by two second-rank men he faced the Government with a demand that a programme of extensive military reform be enacted by Royal Decree, without submitting it to Parliament. This provoked a second crisis, Señor Gimeno, Count Romanones' representative in the Cabinet, having stood firm against such an insult to Parliament. The crisis, however, was settled on the secret understanding that the decree would be granted while Señor La Cierva would negotiate the self-dissolution of the Juntas. Then the conflict was suddenly aggravated on its civil side, the Government having decided to be as firm with the civil Juntas as it had been weak with the military ones. At the instigation of Señor La Cierva, the telegraphs were put under War Office authority and all civil Juntas were declared officially dissolved (March 14), while Señor La Cierva obtained from the military officers an apparent submission under the form of a reduction of their own Juntas to the status of "Committees of Technical Studies." On Feb. 17 the postal services declared a strike. Señor La Cierva's efforts to cope with this by means of military improvisations ended in utter failure, and at the very first sitting of the Cortes (March 18) the Government fell. All possible combinations were tried and failed, until on March 21 at midnight, at a meeting of ex-prime ministers called by the King in his study, after, it is said, having threatened his abdication, King Alphonso succeeded in forming a "ministry of all the talents," composed as follows: Maura (Premier), Dato (Foreign Office), Besada (Finances), Cambó (Public Works), Alba (Education), Marina (War), Pidal (Navy). The solution given to the crisis produced an outburst of popular enthusiasm due mostly to the downfall of Señor La Cierva. This Government had agreed on a concrete programme: reform of the standing rules of the Cortes, amnesty, military reforms, budget. The Government carried them all but the fourth, Señor Alba having left the Cabinet on their refusal to pass his education plans (Oct. 8), which ultimately brought the Cabinet to its end on Nov. 6.

Liberal Government of García Prieto.

Romanones Ministry.

The new Government had to be formed amid the sensation caused by the arrival in Madrid of the news of the Kaiser's flight, and great changes were expected as the result of this. The Reformists having refused to coöperate on the conditions offered them, the changes were limited to the appointment of a Liberal Ministry, on Nov. 9, with Señor García Prieto as prime minister. The world being full of the idea that the triumph of the Allies meant that of democracy, the Government published an "advanced" manifesto. Other signs of the *Zeitgeist* were a bold Land Bill, introduced by Señor Alba, a series of telegrams of congratulations sent by King Alphonso to all the Allied chiefs of state, a meeting of the Conservative party, where a reform of the Constitution was seriously mooted, the waiving by the Government of their right to appoint the Mayor of Madrid, and a revival of the Catalanist question as manifested in a message to the Government addressed by the *Mancomunidad*. This last message produced a split in the Cabinet, Count Romanones, its Foreign Secretary, being in favour of Home Rule. The ministry thus fell on Dec. 3 1918, and it was decided that Count Romanones would form a stop-gap cabinet so as to pass the budget and leave the King free for a change of policy. The first important act of Count Romanones was his visit to President Wilson, then in Paris.

It is clear that from the middle of 1917 on, home problems occupied the Spanish mind more than the war. The incidents of the submarine campaign had to be handled by Governments which knew the country to be resolved not to fight, divided as to its sympathies, and rent by revolutionary and constitutional crises. It is to the credit of the successive Governments which ruled Spain during this period that they succeeded in steering clear of all obstacles, home and foreign, overburdened as they were with home problems and foreign advice not always disinterested. On June 29 1917 a German submarine, "UC52," arrived in Cadiz for repairs. Señor Dato allowed its arrival and departure within 24 hours, and thereupon had a Royal Decree signed forbidding submarine navigation in Spanish waters. The next incident of the kind was the escape of "U53," which had been interned in Cadiz under the above Royal Decree. The escape appears to have been due to an excessive amount of trust in the German commander on the part of the Spanish naval authorities, whom the Government promptly deprived of their commands. On the initiative of the Romanones administration a treaty had been negotiated in London between the Marqués de Cortina and the English Government. This agreement was signed on Dec. 6. Its importance consisted in that it legalized, in the eyes of the pro-Germans, all trade with England, which received food and ore in exchange for coal. Torpedoings continued all the same, and the Spanish Government sent strongly worded notes on the sinking of the s.s. "Giralda" and the s.s. "Duque de Génova" (1918). The s.s. "Larrinaga" was torpedoed while conveying petrol from New York to Santander, on a Government charter (July 25 1918), and thereupon the Spanish Government, alarmed at the heavy losses sustained by the merchant marine, decided to apply to Germany the claim of ton for ton. This was the high-water mark of anti-submarine methods adopted by the Spanish Government. Germany had agreed to the ton-for-ton indemnity when the end of the war came. The Spanish merchant marine had lost 65 ships representing 140,000 tons.

Industrial Effects of the War.

From the material point of view, the neutral attitude adopted by Spain contributed to accelerate the progress which was observable in her economics in the pre-war years. This period of exceptional activity comprises two coincident movements. One is a somewhat artificial "inflation" of Spanish industries, due to the demand of the Allies. The other one is the mere continuation of a development already noticeable before the war. Thus certain industries, really national, such as that of olive oil, succeeded at last in establishing themselves in foreign markets. The effect of the war on the country was therefore neither altogether bad nor altogether good. While it served to stimulate a progress which had already set in, it also created artificial conditions which contributed much to social unrest by flooding the country with money too easily earned.

Troubles in Barcelona.

Fall of Romanones Government.

Count Romanones did not precisely find in Paris in 1919 the diplomatic triumph which he had expected, but neither did he return wholly disappointed. He brought back a seat in the Council of the League of Nations for Spain. He found the country astir with a mixture of two political currents, one a democratic, constitutional agitation, born of the Allied victory, another one a revolutionary agitation which could be traced to the unwholesome effect of the Juntas' *pronunciamientos*. The main effect of these two movements was felt in Barcelona, and was represented by Catalanist propaganda, a military undercurrent of opposition to it, and lastly a syndicalist agitation which made the two former forget their mutual enmity and unite against it. Two sets of events suddenly revealed the power of the syndicalist agitation: a general strike which paralysed the whole life of the town, and a series of murders of employers. The Government played with two policies. It militarized the strikers, then tried to conciliate them by sending to Barcelona three liberal-minded civil authorities—Señor Morote, Señor Montañes (Civil Governor) and Señor Doval (Chief of Police). A violent conflict arose between the military and the civil authorities, and when the strike had been settled by the latter, the Government suddenly resigned. It was known afterwards that this resignation was due to the military having expelled the civil authorities from the town. Señor Maura took office on April 15, asked for a decree dissolving the Cortes, and to the consternation of all parties, obtained it. This amounted almost to a *coup d'état* on the part of the King. After a general election held under a strict censorship, under the protest of all the Left parties (including the Monarchical Liberals), and with the use of electioneering methods which had fortunately been long forgotten in Spain, Señor Maura failed to bring to the new Cortes more than about one-eighth of its total membership under his banner. His Government fell scandalously under a discussion of his electioneering methods (July 15), and Señor Sánchez de Toca (Señor Dato being ill), formed a Conservative Cabinet, which had to deal with a grave situation in Barcelona, where syndicalist trouble was again brewing. But a new outburst of the Juntas forced the Government to resign, and Señor Allendesalazar (a follower of Señor Maura) took office with a Coalition Cabinet. The change of policy which the change of Cabinet implied determined an aggravation of the conflict. Murders continued. A mutiny organized by syndicalist soldiers took place in a barracks in Saragossa. Disorders broke out in Valencia and Santander. Another militaristic outburst, the publication of secret letters by Gen. Milans del Bosch (Capt.-General of Catalonia) and the subsequent dismissal of that officer by the Government, which in its turn caused the resignation of Señor Gimeno, imposed by the military, ended the life of the Cabinet, which, having passed the Budget, left office on March 4 1920. Two schools of thought manifested themselves then: one favourable to occasional coalitions, taking office in order to carry out definite programmes, another one favouring the reconstruction of the old system of two rotating parties. The King favoured this second school, represented by Señor Dato and Señor García Prieto, and the former was called to power. But the general election which he called forth at the end of 1920 showed that the mainspring of that old system—*i.e.* the docility of the electorate to any kind of government—could no longer be counted upon. Señor Dato failed to obtain a working majority, his supporters numbering 177 members out of 405. All his efforts were accordingly bent towards the reconciliation of the several factions within the Conservative party. While engaged in this task he was assassinated by anarchists on March 8 1921.

Conservative Cabinet under Sanchez de Toca.

Dato Prime Minister.

Spanish Literature

The dominant feature of Spanish contemporary literature in 1910–21 may be found in an effort to achieve the fusion of the critical with the creative element in the race (see S. de Madariaga, "Introduction to Spanish Contemporary Literature," *London Mercury*, Sept. 1920). With the death of Galdós, the sceptre of Spanish literature falls on Miguel de Unamuno (b. Bilboa, 1864), a professor of Greek in the university of Salamanca, a voracious reader, familiar with all European, American and classical literature, and an indefatigable writer. Unamuno represents the modern version of the Spanish mystic writer. His main concern is the relation of man to creation. It is the subject of his masterpiece *El Sentimiento Trágico de la Vida*, a book of passionate meditation, and, at any rate as an attitude of mind, it dominates his criticism (*En torno al Casticismo*, *Ensayos*), his novels (*Abel Sánchez*, *Tres Novelas y un Prólogo*) and his plays (*Fedra*). In these works Unamuno appears as the apostle of an ideal of life more closely connected with spiritual Easternism than with the intellectual and social tenets of the West. He thus fulfils in Spain much the same function which Dostoievsky held in Russia, for Spain, like Russia, stands as a transition between East and West. His ideal is in intensity rather than in extension, in individual achievement, the saving of one's soul, rather than in social work and collective material progress. His style corresponds to his beliefs. It reminds one of Carlyle's in that it is written with the whole man's being, body and soul, but it is never eloquent and rhetorical; rather does it tend to conversational familiarity and evinces now and then a proclivity towards being led to new thoughts by the mere shuffling of words.

Should we care to complete the parallel with Russia by finding a Spanish westerner to oppose to Unamuno, as Turgueniev stands to Dostoievsky, a younger man than the Basque master, José Ortega y Gasset (b. 1883), would have to be mentioned. A professor of Philosophy at the university of Madrid, Señor Ortega y Gasset is a refined humanist, strongly influenced by German contemporary neo-Kantian schools of thought. His style is naturally polished and his mind penetrating and acute.

His main work is in the field of criticism and psychology (*Meditaciones del Quijote, El Espectador*). To this same school may be ascribed José Martinez Ruiz (b. 1876), better known under his literary name as "Azorin." His art has all the finish and exquisiteness, all the smallness also, of miniature-painting. He has had the rare merit of applying it to the interpretation of national scenes and places (*Castilla, Los Pueblos*), and has thus contributed in no small measure to the movement for national self-knowledge which is noticeable in contemporary Spain.

In fiction, though belonging to an older generation, Vicente Blasco Ibáñez (b. 1866) must be mentioned, since he continued to wield a never-idle pen. His creative vigour was unabated. His war novel, *Los Cuatro Jinetes del Apocalipsis*, made him famous with the English-speaking public. Older novels have been translated, such as *Sangre y Arena* (as *The Matador*) and *La Barraca* (as *The Cabin*). Blasco Ibáñez represents a kind of art which is Spanish only in its subject, but not in its spirit, manner or style. He is more closely related to the French *naturaliste* school than to any Spanish literary tradition. Of a younger generation, Pio Baroja (b. 1872) is perhaps the most widely read. A Basque, with all the acuity of mind of his race and not a little of its rustic independence and antagonism to civilization, Baroja writes abundantly and carelessly, with more spirit than art. He is more capable of rendering with remarkable accuracy separate aspects of truth than of weaving them into an organic unity endowed with life. His best work is perhaps *Idilios Vascos*, where he has rendered the quaint charm of his own country. Ramón Pérez de Ayala (b. 1881), a critic of great talent, has written several novels, the best of which are *Novelas Poemáticas* and *Belarmino y Apolonio*.

Jacinto Benavente (b. 1866) is still the dominating figure of the Spanish theatre. His most famous play, *Los Intereses Creados* (1907), is not representative, for it illustrates but one phase of the talent of this many-sided author. A more powerful tragedy, *La Noche del Sábado*, is of the same period. In more recent times he has given an intense drama of love in *La Malquerida*. There is, however, a type of play in which Benavente must yield the prize to the brothers Alvarez Quintero (Serafin, b. 1871; Joaquín, b. 1873). As authors of *Comedias de Costumbres* these two writers, who always work together, are unsurpassed. The list of their comedies is long (*Las de Cain, Puebla de las Mujeres*). Other playwrights of note are Linares Rivas (b. 1866), remarkable for his skill in the handling of dialogue; Martinez Sierra (b. 1881), a delicate psychologist; and Pinillos ("Parmeno," b. 1875), a vigorous painter of social conflicts. But drama and comedy are but one, and not the more important, aspect of the Spanish theatre. Still more typical of the nation is what is modestly known in Spain as *gênero chico* (small genre), a full growth of theatrical production, generally short and accompanied with music, and ranging from variety pieces akin to operettas to little masterpieces of musical drama. Its best-known exponents are the brothers Quintero and Carlos Arniches (b. Alicante, 1866).

The two main currents which influenced Spanish poetry towards the close of the 19th century, *i.e.* the national tradition and the symbolist school of France, more or less interpreted by South American poets, such as Ruben Dario (b. 1867), remained still observable up to 1920, though the first was more vigorous and conscious, the second widened so as to include all influences, from those of d'Annunzio to those of Maeterlinck and even Rabindranath Tagore. As more typically national, we shall mention Miguel de Unamuno (*Rosario de Sonetos Líricos, El Cristo de Velázquez*), strong and somewhat unharmonious, but true and austere; Antonio Machado (b. 1875) (*Soledades, Campos de Castilla*), whose pessimistic serenity is in keeping with the landscape of central Spain which inspires his poems; and Salvador de Madariaga (b. 1886), whose *Romances de Ciego* restate, in a new spirit, the old Spanish theme of Jorge Manrique. Other poets appear under more complex influences. Thus Manuel Machado (b. 1874), whose main inspiration is popular and southern, has, however, written excellent verse in which the influence of French elegant sensibility is discernible. Juan Ramón Jiménez (b. 1881), more remarkable for his exquisite sensibility than for his power (*Arias Tristes, Elegías*), is led by his melancholy moods towards fluid rhythms which, though more subtle, remind one of Maeterlinck and, through him, of Rossetti. Ramón del Valle Inclán (b. 1870), perhaps the most skilful musician amongst modern Spanish poets, has given in *La Marquesa Rosalinda* an admirable example of the adaptability of the Spanish language to the most refined rhythms. Ramón Pérez de Ayala (b. 1881), in *El Sendero Innumerable*, succeeds in effecting a happy wedding of thought with harmonious poetry, in a work not wholly uninfluenced by Francis Jammes, d'Annunzio and Walt Whitman.

Among historians of literature the work of Marcelino Menéndez y Pelayo is continued by D. Ramón Menéndez Pidal (b. 1869), whose works on the Poem of Myo Çid and on the Spanish chronicles have thrown great light on the origins of Spanish epic poetry. Francisco Rodríguez Marín (b. 1855), the editor of *Don Quixote*, a specialist in Spanish folklore, has succeeded the master as head of the National Library. In the younger generation, Federico de Onis (b. 1885) has edited Fr. Luis de Leon, and Américo Castro (b. 1885) has worked on Lope de Vega.

Journalism, always a great art in Spain, where the paper is infinitely more read than the book, is cultivated by all writers, and every one of the names quoted above might be quoted here again as a journalist. Mention must be made, however, of two eminent contemporary writers whose work is almost exclusively journalistic—Ramiro de Maeztu (b. 1874), a versatile mind whose educating influence on the Spanish reading public has been incalculable; and Luis Araquistain, a powerful dialectician and a master of the polemic style. (S. de M.)

SPECTROSCOPY (*see* 25.619).—As developed in more recent years (1910–21) the science of spectroscopy has for one of its chief purposes the analysis of spectra, and the deduction therefrom of the nature of the atoms and molecules which generate the spectra. The progress which has been made in this connexion has depended upon improved determinations of the wave-lengths of spectral lines, the further investigation of the varying spectrum of the same substance when excited to luminosity in different ways, the more complete analysis of certain spectra into regular series systems, and, finally, on theoretical investigations. In another direction, important advances have been made in the interpretation of the spectra of the various classes of celestial bodies, which may be regarded physically as experiments on large masses of matter at various high temperatures.

Standards of Wave-Length.—Extensive interferometer determinations of wave-lengths in the arc spectrum of iron, based upon 6438·4696 "international" angstroms for the red cadmium line, have been made by K. Burns[1] and others, which provide valuable standards for the general determination of wave-lengths by interpolation. It has been found, however, that the wave-lengths of many lines differ considerably in different parts of the arc, so that special precautions are necessary in order to obtain comparison spectra in agreement with the tabulated standards. Probably the most accurate set of standards are those given by St. John and Babcock,[2] who used a small central zone of a "Pfund" iron arc operated between 110 and 250 volts, with five amperes or less, at a length of 12 mm. This list contains 1026 lines, from λ3370 to λ6750, and for most of them the wave-lengths are believed to be accurate to 0·001 angstrom.

Flame, Arc and Spark Spectra.—The range of spectroscopic research has been almost indefinitely extended by the discovery that in nearly all cases the same substance yields different spectra when stimulated in different ways. Such differences are of little importance from the point of view of *chemical* analysis, but they have become of great significance to the physicist, and have also greatly aided in the interpretation of the spectra of celestial bodies.

The three typical methods of producing luminosity for the observation of the spectra of metallic elements or their salts are the flame, the electric arc and the electric spark. As a general rule, the three sources exhibit important differences. In the flame the lines are comparatively few in number; in the arc the flame lines remain prominent, but many more lines, including some which are as strong as the flame lines, make their appearance. In the spark, there is a tendency for many of the typical arc lines to disappear, whilst other lines may be much intensified, and entirely new lines may also be present. The important class of lines which are intensified, or which only appear, under the violent action of the condensed spark were designated *enhanced lines* by Sir Norman Lockyer, and this name has been generally adopted. The different classes of lines are thus commonly known as flame, arc, and spark (or enhanced) lines, according to their relative prominence in these three sources. This classification, however, is in some respects imperfect, and more definite designations will doubtless eventually be based upon the theoretical considerations to which reference will be made later.

[1] *Lick Obs. Bull.*, No. 247 (1913); *Zeit. f. Wiss. Phot.* xii., 209.

[2] *Astrophys. Jour.* liii., 260 (1920).

There are many possible variations of these experimental methods of producing spectra, but it would seem that the equivalent of one or other of the three typical sources, or of some intermediate stage, is almost invariably obtained. A more detailed temperature classification of the lines has been based upon experiments with the electric furnace by King,[1] but the terms flame, arc and spark lines suffice for most purposes of description.

Similar variations have also been observed in the spectra of gases when submitted to the action of discharges of varying intensity, and the different classes of lines are sometimes distinguished by analogy as arc and spark lines, although with few exceptions the arc is not actually employed. Independent justification for these names, however, is found in the fact that the arc spectra of some gases can be directly observed. The primary and secondary spectra of hydrogen, for example, have both been observed in the arc,[2] and some of the principal series lines of oxygen have also been observed in the spectra of metallic arcs in ordinary air.[3] The actual spectrum given by a gas depends upon its pressure as well as upon the intensity of the discharge by which it is made luminous. Generally speaking, the greater the pressure of the gas, the greater will be the strength of the discharge required to produce the "spark" lines.

One important aim of modern spectroscopic research has been to search for an explanation of these phenomena, for it cannot be doubted that the causes of the variations in the spectra are intimately connected with atomic structure. In this connexion it will be instructive to refer first to the spectra of known compounds. There are many compounds which can be excited to luminosity without total decomposition,[4] and it has been found that each compound gives a characteristic spectrum by which it can be identified as such. These spectra invariably consist of bands, and different sets of bands characterize, for example, the oxides, chlorides and fluorides of the alkaline earth elements.

It is sufficiently obvious that if a compound be stimulated so strongly that it becomes dissociated, the spectrum will change from one consisting of bands representative of the compound to one containing the lines of the constituent elements. It is not only compounds, however, that show changes of this character. Experiments on nitrogen, for instance, show a range of spectra from one consisting wholly of bands to one in which lines occur alone. Even hydrogen has two spectra: (1) the highly complex, so-called secondary spectrum, which doubtless represents a banded spectrum of rather coarse structure[5]; and (2) the familiar line spectrum, constituting the Balmer series. Similar results have been obtained for many other elements, and from analogy with the spectra of compounds the natural conclusion is that the band spectra of the elements arise from molecules, while the line spectra are produced by the atoms which are set free when the molecules are dissociated.

If this be a true view, the change in the structure of the atom, or in its mode of vibration, which accompanies the successive modifications of the line spectrum becomes a question of paramount interest. Lockyer[6] did not hesitate to believe that while the arc lines of an element were to be attributed to ordinary atoms, the enhanced lines could only be produced by the splitting-up of the atoms themselves, and he called these simpler forms of matter the proto-elements. Proto-calcium, for instance, denoted calcium which had been broken up into sub-atoms by the application of a sufficient stimulus. A somewhat similar, but more probable, explanation has been based upon an application of the quantum theory by Bohr to Rutherford's nucleus theory of the atom. This theory is founded largely on the analysis of spectra into regular series.

Range of Observations.—For the complete determination of the laws of spectra it is necessary to extend the observations far beyond the limits of the visible spectrum. Conspicuous success in the direct photography of the near infra-red spectrum has been achieved by Meggers and others, by the use of ordinary plates stained with dicyanin.[7] By this method excellent photographs of the arc spectra of a large number of elements, extending to λ10,000, have been obtained with a concave grating, and the positions of the lines have been measured with a high degree of accuracy. For the present, the extreme infra-red can only be investigated by thermal effects, involving the use of the thermopile, bolometer, or radio-micrometer, as in the researches of Paschen, Lehmann, and Randall.

Spectroscopic observations in the direction of the ultra-violet, beyond the limit about λ1850 set by the absorption of quartz, and beyond about λ1700 set by the absorption of air, which were first made by Victor Schumann, have been greatly extended by the use of concave gratings, and wave-lengths of considerable accuracy have been determined. Lyman has recorded lines as far as λ500 angstroms, and in similar work at Toronto, McLennan has observed a line attributed to carbon at λ584. A still greater extension has been made at Chicago by Millikan[8] and his colleagues, who have observed lines of nickel as far as λ202. Several improvements in technique were necessary to this success. It was achieved, in the first place, by using gratings specially adapted for the purpose; secondly, by working in an essentially perfect vacuum, through the use of powerful pumps; and finally, since no ordinary spark could pass in a vacuum, by the use of a specially strong sparking apparatus which was capable of forcing a discharge across a very small space between the electrodes. Such a spark was found to produce the extremely short X-rays in the case of carbon, so that the gap which had previously existed between ordinary light waves and X-rays was for the first time bridged.

Spectroscopic data thus cover a very wide range, and offer many interesting problems to the investigator. Their solution depends on his ability to make a true analysis of spectra, and to deduce therefrom the corresponding atomic or molecular conditions.

Analysis of Spectra.—Considerable progress has been made in the analysis of spectra into series. One of the most important advances in this direction is the increased knowledge of the primary spectrum of hydrogen, which is now known to contain, not only the Balmer series, but also two similar series, one in the infra-red and the other in the far ultra-violet. The former was discovered by Paschen, and the latter, previously predicted by theory, was found by Lyman with his vacuum spectrograph. Each of these series is well represented by a mathematical formula, which is simplified if the lines are expressed by their "wave-numbers" (ν) instead of their wave-lengths. The wave-number is the number of waves per centimetre *in vacuo*, and is proportional to the frequency of the vibration. In practice, it is obtained by dividing the wave-length (in angstrom units), connected to a vacuum, into 10^8. In these terms, the formulæ for the hydrogen series are as follows:—

$$\text{Lyman series:}\quad \nu=\frac{N}{1^2}-\frac{N}{m^2}\quad (m=2,\ 3,\ \ldots).$$

$$\text{Balmer series:}\quad \nu=\frac{N}{2^2}-\frac{N}{m^2}\quad (m=3,\ 4,\ \ldots).$$

$$\text{Paschen series:}\quad \nu=\frac{N}{3^2}-\frac{N}{m^2}\quad (m=4,\ 5,\ \ldots).$$

Thus, a general formula for the primary hydrogen spectrum, which might include other undiscovered series, would be $\nu=\frac{N}{m_1^2}-\frac{N}{m_2^2}$.

N is a constant, whose value[9] is 109678·3. m is a constant integer for any one series; and m_2 has a different integral value for each line of a series. R. W. Wood[10] has recently extended the Balmer series to $m=22$, *i.e.* to 20 lines, by experiments with long vacuum tubes. In the spectrum of the sun's chromosphere, 34 lines of the series have been recorded.

There is only one other known spectrum which has the same simplicity as that of hydrogen—namely, the enhanced spectrum of helium. This includes the series first found by Pickering in the star ζ Puppis, and the line λ4686 and others calculated by Rydberg, by whom both series were attributed to hydrogen. These lines were produced in the laboratory by Fowler,[11] and additional lines of the Pickering series, first indicated by Bohr's theory, were afterwards observed by Evans[12] and by Paschen.[13] It was, in fact, the theoretical work of Bohr which first suggested that the lines in question originated in helium and not in hydrogen.

The enhanced series of helium can be represented by a formula similar to that for hydrogen, with the difference that the series constant has rather more than four times the value for hydrogen. Thus, the series which includes λ4686 is given by $\nu=4N'\left(\frac{1}{3^2}-\frac{1}{m^2}\right)$ when N′ is 109723. The complete Pickering series is given by substituting $1/4^2$ for $1/3^2$ in this formula, and a further series calculated by the use of $1/2^2$ has been partially observed by Lyman. It should be noted that alternate lines of the Pickering series are nearly coincident with the Balmer series of hydrogen.

Other spectra exhibit several series superposed. The three types of series early recognized as occurring in the same spectrum were denoted by Schuster as the "Trunk," "Main Branch," and "Side Branch" series, but these names are now entirely superseded by the titles: "Principal," "Sharp," and "Diffuse," originally assigned by Rydberg. A fourth type of series, called the "Fundamental" or "Bergmann" series, has since been recognized. The four chief types are closely interrelated, but apparently have a certain measure of independence. Each series may consist of singlets, doublets, or triplets.

In each series the lines converge to a definite limit, and their wave-numbers are obtained by subtracting a sequence of "terms" from the wave-number of the limit. The formulæ for series in general, however, are not known with the same accuracy as for hydrogen and enhanced helium. In some spectra, notably the arc spectra of the alkali metals, a close approximation to a series is given by such a formula as that of Hicks,[1] namely, $\nu = A - N/(m+\mu+\alpha/m)^2$ where N has nearly the same value as for hydrogen, while μ and α are constants and A is the limit of the series; as before m takes successive integral values. In some series, however, such a formula by no means gives an accurate representation of the observed lines. All that the theoretical investigator can accept with confidence at present is that the general term formula is $N/[f(m)]^2$, where $f(m)$ is a function of m whose form is known only for hydrogen and enhanced helium.

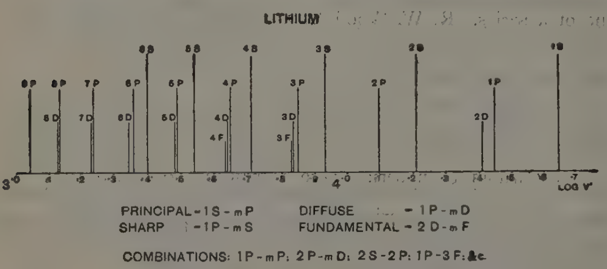
The four main sequences of terms are denoted, for brevity, by the symbols mP, mS, mD, mF, where different integral values of m correspond to the different terms in each sequence. The limit of each of the four series is the first term of one of the others, so that in the abbreviated notation, we have:—

Principal series	$=1S-mP$
Sharp series	$=1P-mS$
Diffuse series	$=1P-mD$
Fundamental series	$=2D-mF$

The term 1P has one, two, or three values, according as the series consists of singlets, doublets, or triplets; and, similarly, the term 2D has two or three values, in doublet and triplet series respectively, when satellites are present in the diffuse series.

It was first shown by Ritz, and expressed in his "combination principle," that lines often occur in positions corresponding to other differences of terms besides those giving the four main series. Thus, there may be a series $2S-mP$, $1P-mP$, and so on. Many lines not previously included have in this way been proved to form part of general series systems.

The recognition of the importance of "terms" is a definite step towards the simplification of spectra, since the number of terms is less than the number of lines included in the series and combinations. Moreover, theoretical investigations indicate that the terms have a more immediate physical significance than the lines themselves. On this account, it is of great interest to construct a "term-spectrum," in which the terms, instead of the lines, are plotted along a horizontal scale. Such a term-spectrum—for the element lithium—is shown in the appended diagram. For economy of space, the terms are represented horizontally by their logarithms instead of their actual values.



In the term-spectrum diagram, the four main sequences are distinguished by the varying heights of the strokes by which their terms are represented. The highest principal term (1P) minus the sets of sharp and diffuse terms, gives the sharp and diffuse series of lines respectively, while the highest sharp term (1S) minus the set of principal terms, and the highest diffuse term (2D) minus the set of fundamental terms, give the principal and fundamental series. These four series are generally well developed, but, as already remarked, other combinations often arise. It appears, however, that all the combinations which are mathematically possible do not occur with the same frequency.

Origin of Spectra.—The theory of Bohr,[2] which has already been mentioned, offers a remarkably accurate explanation of the spectra of hydrogen and enhanced helium, and gives a physical meaning to the terms which has proved very fruitful in suggesting new directions of research. According to this theory, the atom of an element consists of a positively charged nucleus surrounded by an appropriate system of electrons, such that the total negative charge of the electrons is equal to the positive charge of the nucleus. Nearly the whole of the mass of the atom is concentrated in the nucleus, which is very small in comparison with the distances separating it from the electrons. When an electron is removed from its normal position by the application of an external stimulus, it may traverse temporarily one or another of certain orbits determined by quantum considerations. In each of these orbits it has a certain amount of energy, which is assumed to remain constant while the electron revolves in the orbit. The terms of the spectrum are then taken to be proportional to the respective amounts of energy. When the electron returns to its normal position, it comes to an orbit in which, for equilibrium, it must possess less energy than it had in the temporary orbit. The difference of energy, which is proportional to the difference of the corresponding terms, is emitted as a homogeneous radiation, and gives rise to a definite spectral line, while, if the electron occupies successively different orbits on its return, several lines will be produced in succession. The actual spectrum at any moment is the summation of the different lines yielded by atoms in different states. The term spectrum can thus be regarded as a diagram of the atom, in which the nucleus is at the zero of the scale (to the right in the diagram), and the strokes are parts of the possible orbits. A spectrum line appears when an electron passes from one orbit to another on its return towards its normal position in the innermost orbit.

The differences between the arc and enhanced spectra receive a simple explanation on the Bohr theory. The lines of an arc spectrum are supposed to be generated by the disturbance of a single electron and its subsequent interaction with the nucleus and remaining electrons. When two electrons are removed from their normal positions, and one remains at a great distance, the return of the second electron generates an entirely different spectrum consisting of the enhanced lines. An atom which has lost one or more electrons is said to be "ionized."

Assuming the hydrogen atom to consist of a nucleus and a single electron, the energies of the possible orbits can be calculated, and are found to be proportional to the observed terms N/m^2. Helium, the next lightest element to hydrogen, is believed to have two electrons, and the mathematical problem of determining their motion has not yet been solved. If one of the electrons is removed, however, the atom is similar to that of hydrogen, except that the nucleus has a double positive charge and a greater mass. The resulting enhanced terms are therefore calculable. They again have the form N/m^2, but N has now a much larger value than it has for hydrogen. It is represented in both cases by the expression $\frac{2\pi e^2E^2}{ch^3}\cdot\frac{mM}{m+M}$, where e, m, and E, M, are respectively the charge and mass of the electron and nucleus, h Planck's constant and c is the velocity of light. In the case of hydrogen $E=e$, and when the experimental values of the various quantities are substituted in the formula, the series constant is reproduced with remarkable accuracy. The second factor increases with M, so that it will be slightly greater for helium than for hydrogen. Also, the double nuclear charge makes the first factor in the expression for N four times as great for enhanced helium as it is for hydrogen. These theoretical requirements have been completely verified by experiment. Fowler, calculating N for hydrogen and helium from the observed lines, used the theoretical expressions to calculate the value of M/m,—*i.e.* the ratio of the masses of the hydrogen atom and the electron—and obtained a result in very close agreement with that arrived at by direct measurement. Moreover, he has shown[3] that in the more complicated spectra of the alkaline earths, the enhanced line terms are also represented by formulæ in which N has four times its value for arc spectra.

It has not yet been possible to calculate the theoretical terms of other spectra, on account of the mathematical difficulties connected with the interaction of more than two bodies. The same principles, however, are believed to apply to atoms containing many electrons, and the physical conceptions of the theory have led to valuable information regarding the order of excitation of the lines under gradually increasing stimulus.

Further developments of the theory, taking into account the variation of the mass of the electron with velocity required by the theory of relativity, have indicated that the lines of the hydrogen and enhanced helium series are complex, and under high resolution should appear to consist of several components. This has been verified by Paschen,[4] who found results for helium in remarkable agreement with the predictions of Sommerfeld. The intensities of the several components also are in the ratio calculated by Sommerfeld by a special hypothesis.

Resonance and Ionizing Potentials.—Strong support for the Bohr theory is given by experiments in which atoms are bombarded by electrons, with a view to temporary disintegration. If an electron, of charge e falls through a potential difference, V, it acquires a

quantity of energy, eV, expressed in appropriate units. If such an electron bombards a neutral atom, it is found that no change takes place until V reaches a certain value, when there is a sudden radiation of energy corresponding to a particular line—usually a strong flame line—in the spectrum of the bombarded atom. According to Bohr's theory, the energy in this particular radiation is equal to $h\nu$, where ν is the wave-number of the line, and h is Planck's constant. Experiments with several elements show that this critical value of V is determined by the relation $eV = h\nu$. This means that the energy of bombardment has been just sufficient to remove the electron in the atom from its normal position to the next orbit, and, on its return, the electron restores the energy in the form of monochromatic radiation of the appropriate frequency. If V is expressed in volts, the wave-number of the emitted line is numerically equal to $V \times 8102$. The value of V when emission first takes place is known as the "resonance" or "radiation" potential. Further, by increasing V, it is possible to remove an electron from the atom altogether. If the energy, eV, in this case is equated to $h\nu$, the resulting value of ν is found to be equal to the largest term in the spectrum—usually the term 1S, the limit of the principal series. This term would correspond to the innermost orbit of the electron, and the result suggests that the energy which must be applied to remove an electron from the atom is just equal to the energy possessed by the electron when revolving in its normal position. The potential required to remove an electron from the atom is known as the "ionizing potential." It has been determined experimentally for a number of elements and has been found to be in complete agreement with the orbital energy as calculated from the largest term in the spectrum. The Bohr theory thus presents a simple picture of the processes taking place in experiments of this type.

The Stark Effect.—The resolution of spectral lines under the influence of intense magnetic fields—usually known as the Zeeman effect—has been extensively studied for a large number of elements. Somewhat similar effects, but much greater in magnitude, produced by an electric field, have been brought to light by Stark,[1] and examined in considerable detail by a number of workers. Nicholson and Merton [2] have shown that the Stark effect may operate to an appreciable extent in an ordinary vacuum-tube discharge, causing a broadening of the lines. Both the Zeeman and Stark effects have been treated on the basis of the Bohr theory,[3] with some success.

Spectra and the Periodic Table.—Attention is being drawn more and more to the relation of the spectrum to the periodic table of the elements. While it cannot be said that the relation is known with any approach to completeness, a number of important facts have been noted which may ultimately prove of great service in the interpretation of the table. It has long been known that, when doublets or triplets occur in the spectra, the wave-number separations of their components (which are constant in the sharp and diffuse series) are approximately proportional to the squares of the atomic weights of the elements producing the spectra—so long as those elements belong to the same family group. The Zeeman effect also is generally the same for lines of corresponding series in the spectra of elements belonging to the same group. But perhaps the most comprehensive connexion of spectra with the periodic table is established by the "displacement law" of Kossel and Sommerfeld.[4] It has been observed that the "complexity" of the lines of a series—*i.e.* their character as singlets, doublets or triplets—is constant throughout a group, but varies from one group to another. The displacement law states that, when an element is ionized, the enhanced series take on the same type of complexity as the arc series produced by the element to the left (*i.e.* in the preceding group) in the periodic table. It is assumed that electrons arrange themselves round the nucleus in rings, and that spectrum phenomena are produced by electrons in the outer ring. If the outer ring contains an odd number of electrons, the spectrum will consist of doublets, while, if the number is even, the spectrum will show triplets and singlets. In the periodic table each element contains one outer electron more than its neighbour in the preceding group, while a group consists of elements having the same number of electrons in the outer ring. It follows that the removal of an electron from an element will make the outer ring similar to that of the immediate forerunner of the element in the table, and so make the enhanced lines of the first element of the same type of complexity as the arc lines of the second. Removal of a second electron would restore the arc type of complexity, for the number of outer electrons would again become odd or even, as the case might be. A second ionization is difficult to bring about in most cases, but with silicon it is probable that one, two, and even three electrons have been removed, step by step, thus making possible four distinct spectra. These appear to show the alternation of complexity required by the displacement law. The table above gives the types of series produced by the neutral and ionized elements of the various groups, so far as they are known at present.

The spectra of the higher groups are much more complex than those of the lower ones. Their series, if they possess any, are possibly of a different type from those with which we are familiar. The displacement law, however, suggests that, by repeated ionizations, series—and therefore terms—might be detected in such spectra, of the same kind as those of the groups of elements on the left. But since, with each successive ionization, the term constant, N, is multiplied in the ratio 1:4:9:16—etc., the chief series lines might tend rapidly to approach the far ultra-violet and become difficult to observe.

Band Spectra.—Several band spectra have been studied in further detail, but it does not appear that any very fundamental advance in our knowledge of the structure of these spectra has been made. The discovery of a band spectrum of helium,[5] however, is probably of considerable importance. It has been shown by Fowler[6] that, while the individual bands follow the ordinary laws of band spectra, the heads of some of them are arranged in accordance with the laws of line series. In this respect the helium bands appear to be quite unique. Unlike the *lines* of helium, the bands have not yet been traced in any celestial source.

The Solar Spectrum.—A striking feature of continued work on the solar spectrum is the identification of a large number of faint lines with lines composing the bands of certain compounds, in addition to the band lines of carbon and cyanogen previously recognized by Rowland and Lockyer. The peculiarities of the region about the G group of Fraunhofer have been shown by Newall[7] to be due to the absorption of the well-known hydro-carbon band $\lambda 4315$, and the group P has been found by Fowler and Gregory[8] to include the strong ultra-violet band of ammonia having its maximum near $\lambda 3360$. In addition, the band of luminous water vapour beginning at $\lambda 3064$ has been found by Fowler[9] to be present in the solar spectrum. A large number of previously unknown solar lines have thus been accounted for, and it is not improbable that the thousands of faint lines which remain unidentified may eventually be traced to other band spectra.

An interesting application of modern theories of spectra to solar problems has been made by M. N. Saha.[10] On the reasonable assumption that the composition of the sun is essentially the same as that of the earth, it remains to account for the absence of spectral indications of many of the elements. Dr. Saha urges that the varying representation of different elements arises from the varying response of these elements to the solar stimulus, depending upon the structure of their atoms, and the consequent difference in their ionizing potentials. Cæsium, for example, has a low ionizing potential and is considered to be completely ionized in the sun, so that the familiar lines do not appear, while the chief lines of the ionized element are out of range. In contrast, sodium has a higher ionizing potential and is only partially ionized in the sun, so that the lines of the neutral atoms appear strongly. Other elements, such as neon and argon, have very high ionization potentials, and are not excited at all. Dr. Saha finds support for his views in calculations of the percentage ionizations of various elements at different temperatures and pressures, and it is possible that the peculiarities of the solar spectrum may be satisfactorily explained by these considerations.

Stellar Spectroscopy.—Our detailed knowledge of the spectra of the stars has been greatly advanced by the use of the large telescopes which have been erected, and considerable progress has also been made in the interpretation of the stellar lines through experiments in the laboratory. In particular, the use of stronger discharges than had previously been employed has led to the discovery of new lines of several elements, which have been identified with the lines occurring in the hotter stars. Certain lines of the Wolf-Rayet stars, for example, have thus been traced to carbon by Merton,[1] and others to oxygen by Fowler and Brooksbank.[2] The general outcome of the experimental reproduction of stellar lines is to support the view that the order in which the different classes of stars had been arranged is a true temperature sequence. This order, previously indicated by Secchi and Vogel, is now generally expressed by the classification introduced at Harvard by E. C. Pickering, in which the most important classes, passing from the white to the redder stars, are designated by the letters B, A, F, G, K, M.[3] On passing from the relatively cool M stars to the hot B stars, it is necessary, in accordance with the work of Lockyer, to employ a gradually increasing stimulus in order to excite the spectra which appear at successive stages of the stellar sequence.

There are certain peculiarities of the successive stellar spectra which call for explanation, if it be assumed that all stars are of essentially the same composition. Thus, at every stage of the stellar sequence there are many elements which are not represented at all, and different selections of the elements appear at the various stages. The earlier attempts to deal with such questions are incompatible with modern views as to the origin of spectra. The new theory of spectra, however, supplemented by a theory of the temperature radiation of gases, has been shown by Dr. M. N. Saha[4] to provide a very probable explanation of most of the phenomena. According to this theory, a gas or vapour may emit radiations, or become ionized, by subjecting it to appropriate thermal stimulus, depending in part upon the density, and the emissions produced mechanically by the spark may thus also be generated by the action of a sufficiently high temperature. Dr. Saha concludes that, under the temperature stimulus prevailing in the atmosphere of any particular star, certain elements are excited to radiation of their characteristic lines, in accordance with their resonance and ionization potentials, while other elements are either ionized, or the stimulus is too weak to excite the lines by which their presence could be recognized. When an element is completely ionized in this way, it will often happen that the most characteristic lines of the modified atoms will lie far in the ultra-violet, outside the range of possible observation, so that the element will escape detection. Again, under the action of the highest temperatures, a second step in ionization may set in, producing still more refrangible chief lines as a rule, so that even the elements which yield enhanced lines in the ordinary range of spectrum at some stages will eventually cease to be represented. The simplification of the spectra of the hotter stars thus receives an acceptable explanation; the surviving elements represented in the spectra are those for which the maximum amount of energy is required to produce the successive ionizations, or those for which these conditions yield lines of sufficient intensity within the range of spectrum which is open to observation. Preliminary calculations of the probable temperatures at which such changes of spectrum would occur are in substantial agreement with the temperatures of the various classes of stars deduced from spectro-photometric observations by Wilsing and Scheiner. It therefore seems probable that temperature is the controlling factor in determining the character of the spectrum given by a star, and, as Dr. Saha remarks: "The stellar spectra may be regarded as unfolding to us, in an unbroken sequence, the physical processes succeeding each other as the temperature is continually varied from 3000° to 40,000°."

SPEE, COUNT MAXIMILIAN VON (1861–1914), German admiral, was born June 23 1861 at Copenhagen. He was first officer of the battleship "Brandenburg" when it was sent to East Asia in 1899 during the Chinese boxer disturbances. In 1908 he was chief of the staff of the North Sea command, and in 1913 he was appointed chief in command of the Cruiser Squadron. When the World War broke out he was on a voyage with this squadron from Tsing-tau to the South Sea Islands. He was hard pressed by British and Japanese naval forces, but was at an advantage when he was engaged on Nov. 1 1914 off Coronel on the Chilean coast by Adml. Cradock with a British squadron which was inferior to his own in numbers and speed, as well as in range and weight of fire. Adml. Cradock went down with his ship, the "Cape of Good Hope," and the "Monmouth" was also sunk. On the following Dec. 8 Count Spee's squadron was drawn into action off the Falkland Is. by the powerful cruiser squadron of Adml. Sturdee which had been sent out to look for him. Count Spee's own ship, the "Scharnhorst," was sunk, he himself and his two sons going down with all hands. The "Gneisenau" was also sunk, as were the "Leipzig" and the "Nürnberg." The light cruiser "Dresden" escaped, but was afterwards sunk off Juan Fernandez in the Pacific.

SPIELHAGEN, FRIEDRICH VON (1829–1911), German novelist (*see* 25.667), published during his later years *Freigeboren* (1900); *Die schönen Amerikanerinnen* (1902); *Ultimo* (1903); and *Am Wege* (1903). He died at Charlottenburg, Berlin, Feb. 25 1911.

SPIERS, RICHARD PHENÉ (1838–1916), English architect and author. Phené Spiers occupied a unique position amongst the English architects of the latter half of the 19th century, his long mastership of the architectural school at the Royal Academy having given him the opportunity of moulding and shaping the minds of more than a generation of students. He was educated in the engineering department of King's College, London, and proceeded thence to the atelier Questel of the École des Beaux-Arts, Paris, for upwards of three years, a method of study rare for an architectural student in those days. On his return he won the gold medal and travelling scholarship of the Royal Academy, and in 1865 the Soane medal of the R.I.B.A. In 1871, after he had worked in the offices of Sir Digby Wyatt and William Burges, he gained second premium with a spirited design (showing a good deal of the Neo-Grec feeling consequent on his French training) for the new Criterion building, London. His work of about this period included Lord Monkswell's house, Chelsea. Phené Spiers travelled in France, Spain, Egypt, Syria and the East, and besides his record of more purely architectural data, he made many water-colour sketches showing much talent and facility. He was a frequent exhibitor at various galleries, and a good specimen of his art—the loggia at Hampton Court—is in the Victoria and Albert museum. His works and publications were many, and covered a wide ground. Amongst them are his new edition of James Fergusson's *History of Architecture* and the further volumes on Indian and Eastern art; *Architectural Drawing; The Architecture of Greece and Rome* (conjointly with the late W. J. Anderson); *The Mosque at Damascus;* and the articles on Persian and Roman Architecture in Dr. Russell Sturgis's *Dictionary of Architecture*, besides an edition of Pugin's *Normandy.* For the *E.B.* Spiers wrote most of the articles dealing with architecture. The position to which his erudition and ability entitled him was fully recognized in other countries as well as his own, as is shown by his election to membership of many foreign societies in France, Spain and America. He died in London Oct. 3 1916.

SPIRITUALISM: *see* PSYCHICAL RESEARCH.

SPITSBERGEN (*see* 25.708).—The highest peaks in Spitsbergen are believed to be Mount Newton, 5,676 ft., and Mount Poincaré, 5,446 ft., both in the eastern part known as New Friesland. Mount Eidsvoll in King James Land is 4,770 ft, and Mount Monaco on Prince Charles Foreland is 3,543 ft.

Geology.—Considerable exploration has not greatly modified the main conception of the geological structure. The old rocks of the W., generally described as the Hekla Hook series, seem to be of Silurian age to which may also be ascribed the so-called Archaean rocks of the N.W. There are no Permo-Carboniferous rocks in King James Land and the strips of rocks on the N.E. side of Prince Charles Foreland and the opposite shores of the mainland, formerly attributed to that age, are now known to be Tertiary. Certain of the coal measures in Advent Bay prove to be of Cretaceous and not Tertiary age and these Cretaceous beds probably appear also below the Tertiary beds in Lowe Sound.

[1] *Proc. Roy. Soc.*, A, xci., 498 (1915).

[2] *Monthly Notices*, *R.A.S.*, lxxvii., 511 (1917).

[3] The work of H. N. Russell, in general agreement with that of Lockyer, renders it probable that the true sequence is from M to B with increasing temperature, and thence from B to M with decreasing temperature, the density increasing throughout. Stars of rising temperature, on account of their great volume, have been called "giants," those of falling temperature "dwarfs." Differences between the spectra of giants and dwarfs of the same spectral class have been found by Adams (see *Monthly Notices*, *R.A.S.*, lxxxi., 334).

[4] *Proc. Roy. Soc.*, A, xcix., 135 (1921).

An extinct volcano and several hot springs with a temperature of 75° to 82° F. were discovered in Bock Bay, off Wood Bay, in 1910. The volcano seems to date from a later period than any other volcanic manifestation found in Spitsbergen. Research has proved that dislocation has played a great part in determining the main features of the fjord system, especially in Ice Fjord where the course of the fjord has been decided by great faults.

Climate.—From the meteorological data now available, including eight years' records from Green Harbour, the following means may be given: Cape Thordsen, Jan. 0·3° F., July 39·9° F.; Green Harbour, Jan. 6·7°, July 39·7°; Axel I. (Lowe Sound), Jan. 1·6°, July 40·3°; S.E. of Edge I., Jan. 1·5°, Aug. 37·4°; Bear I., Feb. 10·4°, Aug. 40·1°. The mean annual precipitation at Green Harbour is 11·6 in.; Prince Charles Foreland has more and the interior of Spitsbergen less.

Exploration.—There is little doubt that the land called Svalbard ("cool coast") in the Icelandic annals, discovered by Norsemen in 1194, was really Spitsbergen. If Spitsbergen was forgotten by the Norsemen it was possibly rediscovered by Russian hunters from the White Sea in the 15th or 16th centuries or at least previous to Barents' rediscovery in 1596.

Recent exploration in Spitsbergen has been devoted mainly to geological work, largely with economic ends in view, and detailed cartographical survey. A German expedition under Lt. Schroeder-Stranz in 1912 came to grief on the N. coast, after the loss of the leader. Half the staff were lost and the survivors were rescued by Norwegians under A. Staxrud.

The principal survey work has been done by Norwegians working in small parties every summer since 1906, assisted by grants from the Norwegian State. These parties have been successively commanded by G. Isachsen, A. Staxrud and A. Hoel, and have mapped in detail the western side of the mainland from the N. coast to the South Cape. The work is expedited by the use of photogrammetric methods to assist triangulation. The detailed survey of Prince Charles Foreland has been completed by Dr. W. S. Bruce and assistants who have also mapped the area between Klaas Billen and Sassen bays. Swedish surveyors have mapped the land round Lowe Sound and Braganza Bay. The Prince of Monaco has shown continued interest in Spitsbergen exploration by giving assistance to several explorers, including the Swiss H. Stoll who in 1913 crossed the unknown country between Lowe Sound and Agardh Bay on Stor Fjord. Lt. W. Filchner in 1910 surveyed the glaciated region between Temple Bay and Mohn Bay. In 1920 J. M. Wordie scaled several of the highest peaks on the W. coast, including Mounts Monaco, Rudmose and Barents. Hydrographic surveys have been carried out by G. Isachsen and others on the W. coast and in Green Harbour, by W. S. Bruce in Foreland Sound, Klaas Billen and Sassen bays and Stor Fjord. Swedish Government surveyors have been at work in Lowe Sound. Oceanographical work has been done in Spitsbergen waters by Dr. F. Nansen. The Norwegian Government has maintained a wireless telegraph station and meteorological observatory in Green Harbour since 1911. A German meteorological station was founded in Eleltoft Haven, Cross Bay, in 1910 as the outcome of a visit by Prince Henry of Prussia and Count Zeppelin when experiments with dirigible balloons were conducted. This station was abandoned in Sept. 1914. In 1920 Norway opened a new meteorological and geophysical station for aerological and geomagnetic research. Besides the Norwegian state wireless station at Green Harbour, there were in 1921 seven others (4 Norwegian, 2 English and one Swedish). In Aug. 1921 a Norwegian Church was consecrated at Longyear City.

Mining.—The development of the coal-fields has proceeded rapidly, greatly stimulated during the war by the scarcity and high price of coal in Scandinavia. The coal-mine in Longyear Valley, Advent Bay, which had been under American ownership since 1905, was sold in 1916 to Norwegians who have been assiduous in their export. Several other Norwegian mines have started, notably in Kings Bay, Green Harbour and Hjorth Haven in Advent Bay. Swedish mines were opened in Lowe Sound (Braganza Bay) in 1917. There are Russian mines in Green Harbour and Dutch mines at Cape Boheman. British enterprise, hampered by war conditions, revived in 1919 in the coal-bearing areas in Klaas Billen Bay and Lowe Sound. By 1920 practically all the coal-bearing areas were annexed by one or other company and at least five mines had reached the export stage. The total amount of coal exported in 1919 was 90,000 tons, all of which went to Norwegian ports, including some to Narvik for the Swedish railways. The coal exported so far is of Tertiary and Cretaceous age and proves to be good steam coal. Bituminous coal of Carboniferous age will soon be available for export. Jurassic coal occurs but is of poor quality and no longer worked. Mining continues throughout the year but the export season at present is from June to Sept. The largest mining camp is Longyear City in Advent Bay, housing some 400 men in summer and 300 in winter. No other minerals besides coal are as yet exploited commercially, but large deposits of iron ore (36% iron) and gypsum are known, as well as smaller deposits of zinc and asbestos. Signs of oil have been reported. A Norwegian company is exporting coal from Bear Island. The approximate area (in sq. m.) of estates owned by various nationals in Spitsbergen is as follows: British 6,500, Norwegian 900, Swedish 400, Russian 60 and Dutch 10. Whaling was revived in Spitsbergen waters in 1905, abandoned in 1912 and restarted during the World War. The only station is now in Green Harbour. Winter fur-hunting is pursued by a few Norwegians.

Political History.—The question of political control had been discussed since about 1870, mainly by Norway, Sweden and Russia, without any solution being found. Spitsbergen therefore occupied the curious position of being *terra nullius*. In 1907, however, Norway again opened negotiations for an international conference to decide the question of sovereignty, and one was held at Christiania in July-Aug. 1910, followed by another in 1912, without definite result. In July 1914 a conference which included also representatives of Britain, France, Belgium, the United States, Holland and Germany tried to devise a form of administration consistent with the country remaining a *terra nullius*, but the outbreak of the World War put an end to the discussions. In 1919 the Supreme Council conferred the sovereignty of Spitsbergen, including Bear I., on Norway. The signatories of the treaty were Great Britain and the British Dominions, France, Italy, the United States, Japan, Holland, Denmark, Norway and Sweden. The rights and territories of nationals other than those of Norway are safeguarded, and Norway is not allowed to show preferential treatment to Norwegian mining companies or to levy taxes except for expenditure on the administration. Disputed claims to estates were to be decided by a neutral commission presided over by a Dane.

BIBLIOGRAPHY.—The literature is in the main scattered in periodical publications: specially useful are *Ymer* (Stockholm), *Videnskapsselskapets skrifter* (Christiania), *Naturen* (Bergen), *Scottish Geographical Magazine* and *Résultats des Campagnes Scientifiques*, par Albert I., Prince de Monaco, vol. xl., xli., and xlv. Two modern works giving recent history and economic developments are *Spitsbergen: its exploration, hunting and mineral riches*, by R. N. Rudmose Brown (1920), and *Spitsbergens Natur og Historie*, by G. Holmsen (1911). "Fra Ishavet" by G. Isachsen in *Det Norske Geografiske Selskabs Aarbok* (1916–19) gives much information about Norwegian hunters. *The Dutch Discovery and Mapping of Spitsbergen 1596–1829*, by F. C. Wieder (Amsterdam, 1919), has many reproductions of early maps. The meteorological observations at Green Harbour are published annually in *Jahrbuch des Norwegischen Meteorologischen Instituts* (Christiania). *Mit Zeppelin nach Spitzbergen*, by A. Miethe and H. Hergesell (Berlin 1911), is noteworthy for the excellence of its illustrations, including colour plates. Some of the results of the Norwegian surveys are collected in *Expédition Isachsen au Spitsberg 1909–10. Résultats scientifiques* (Christiania 1916). The geomorphology of Spitsbergen is explained by G. de Geer, "On the physiographical evolution of Spitsbergen," in *Geog. Annaler*, I. (Stockholm 1919).

(R. N. R. B.)

SPORTS AND GAMES.—The tendency towards "internationalism" in competitive sports and games had been rapidly growing in intensity, partly as a result of the establishment of the Olympic Games, from 1896 onwards; but it was rudely interrupted by the World War, and conditions were still unfavourable up to 1921 for more than a limited renewal. The decade from 1911 to 1921 offers no proper material, therefore, for a consistent history in this field, by way of supplement to the separate articles in the earlier volumes of this Encyclopædia; nor, indeed, in the case of most sports and games, as carried on in 1910–21, had there been more than minor changes, either in equipment, methods or rules. So far as British and American interests, however, are concerned, the chief statistics, as regards the main events in the more important sports and games, are recorded in the following sections.

Athletics, Track and Field.—The Olympic Games were held at Stockholm in July 1912, the highest number of points being scored by the United States, and again at Antwerp in 1920, the 7th Olympiad being projected for Paris in 1924.

While the United States won the track and field events of the 1920 Olympic games in Antwerp by a considerable margin in the point score, and set new records in the pole vault, the high jump, and the 400-metre hurdles, the Americans totalled only 9 first places, the same as the team of 24 men from Finland. The "stars" of the American team were C. W. Paddock in the 100 metres, Allan Woodring in the 200 metres, Frank Loomis in the 400-metre hurdles, Richard Landon in the high jump, Frank Foss in the pole vault, Pat Ryan in the hammer, Pat McDonald in the 56-lb. weight, and H. H. Brown, the individual winner in the 3000-metre team race, the only American to win a distance event. In swimming the Americans were supreme, with Duke Kahanamoku and Kealoha, both of Hawaii, Norman Ross, Ethelda Bleibtrey, Aileen Riggin and Charlotte Boyle. The winners at the American eastern college meetings were: 1911, Cornell; 1912, Pennsylvania; 1913, Pennsylvania; 1914, Cornell; 1915, Cornell; 1916, Cornell; 1918, Cornell; 1919, Cornell; 1920, Pennsylvania; 1921, California. Princeton won against Oxford (July 8 1920) at Queen's Club, London, by 6 events to 4. At the Pennsylvania Relay Games (April 30–May 1 1920) the Oxford-Cambridge 2-m. team, Tatham, Stallard, Milligan and Rudd, set a new world's record of 7 min. 50⅖ sec.

Cricket.—Before the war English cricket was in a flourishing condition. The visit of a South African team to Australia in 1910–1, in which the South Africans did hardly as well as had been expected, served as a prelude to the so-called Triangular Tournament of 1912; and in the meantime an English team under the management of the Marylebone Cricket Club carried through a successful tour in 1911–2. Of 18 eleven-a-side matches the M.C.C. team lost only the first test match; four were drawn, and 18, including four test matches, were won by the Englishmen. At the end of 1910 a team sent to South Africa by the M.C.C. won two and lost three test matches. In 1912 the interest in county cricket was largely eclipsed by the Triangular Tournament between England, Australia and South Africa, in which nine test matches were played. England proved victorious, winning four matches (three against South Africa and one against Australia) and drawing twice with Australia, owing to bad weather. The Australians beat the South Africans twice. Of the 102 matches played up to 1920 between England and Australia, England won 46 and Australia 35. Of those played in England the home team won 17 and Australia 8, and 17 were drawn. In those played in Australia England won 30 and Australia 27, three being drawn. In 1921, however, in their visit to England, the Australians won an easy victory.

A new method of deciding the English county championship was inaugurated in 1911. With the idea of discouraging the players from aiming at drawn matches, five points were given for a win, and three points (with one point to the losing side) for a first-innings victory. The championship was won by Warwickshire in 1911, by Yorkshire in 1912 and by Kent in 1913. In 1914 the championship was not decided owing to the outbreak of war, but the M.C.C. Committee adjudged Surrey the winners. It was resumed in 1919, when a new system was adopted, by which only wins counted, the winners being the county with the highest proportion of wins to matches played. Yorkshire was at the head of the list in 1919, and Middlesex in 1920 and 1921.

The Oxford and Cambridge match was not played between 1915 and 1918. In 1911, 1914 and 1919 Oxford won, and in 1912, 1913 and 1921 Cambridge were the winners, the match in 1920 being drawn. From 1911 to 1921, with the exception of the years 1915 to 1918, when the match was not played, Eton won against Harrow.

English Football.—(1) Rugby.—In 1911 a French team for the first time was victorious in an international match, beating Scotland in Paris. In the same season Wales beat England, Ireland, Scotland and France; Ireland beat England, Scotland and France; England at Twickenham beat Scotland and France. In 1912 all the international matches that took place in the United Kingdom were won by the fifteen playing in its own country. England defeated Wales and Ireland, but narrowly lost to Scotland. Ireland beat Scotland and Wales, and Wales beat Scotland. In no match was France victorious. A strong South African team began a tour in Great Britain in the autumn of 1912. After gaining several decisive victories over counties, the South Africans lost to Newport, were with great difficulty victorious over Llanelly, the United Services and London, beat Oxford and Cambridge Universities, were narrowly beaten at Twickenham by another London fifteen, and easily beat Scotland at Edinburgh. They next gained their most decisive victory at Dublin, securing 36 points against Ireland, and beat Wales by a try at Cardiff, but lost to Swansea by the same margin. In the international matches in 1913 England defeated Scotland, Wales, Ireland and France; Wales beat Scotland, Ireland and France; Scotland beat Ireland and France; and Ireland beat France. In 1914 England beat Scotland, Wales, Ireland and France; Wales beat Scotland, Ireland and France; and Ireland beat Scotland and France. From 1915 to 1919 the matches were not played. In 1920 England beat Scotland, Ireland and France; Wales beat England, Ireland and France; Scotland beat Wales, Ireland and France; and France beat Ireland. The University match went in favour of Oxford in 1910, 1911, and 1913. Cambridge won in 1912, 1914, 1915 and 1920. (2) *Association.*—In 1910 a tour was undertaken in Brazil by the Corinthian Football Club, and another in North America in 1911–2. From 1907 to 1914 amateur international football was affected by a dissension among English clubs. In consequence of the Football Association insisting upon the admission of professional clubs (so-called) to the district associations, a large number of amateur clubs, including the University, College and Public Schools Club, seceded to form the Amateur Football Association. The officers of the army, while sympathizing with the seceders, considered it advisable for the sake of regimental football to retain their connexion with the Football Association. But in 1911–2 they used their influence to promote a reconciliation. A conference was held at which the delegates of the two associations only failed to arrive at an agreement because the older body would not accept an arrangement by which the younger could receive the adherence of newly formed amateur clubs. In 1914, however, the Football Association and the Amateur Football Association sank their differences. The Amateur elevens of the Football Association won matches with Wales, Belgium, France and Holland in 1910–1, but lost to Ireland. In 1911–2, besides victories at the Olympic Games, they defeated Ireland, Wales, Denmark, Holland and Belgium. The Amateur Football Association teams beat Wales and France in both seasons. The full representative eleven of the Football Association defeated Ireland and Wales in 1911 and drew with Scotland. Ireland lost to Wales and Scotland, and Scotland drew with Wales. In 1912 England and Scotland again played an indecisive match, but both beat Wales and Ireland; Wales lost three matches. In 1913 England beat Scotland and Wales; Wales beat Ireland and drew with Scotland; Scotland beat Ireland; and Ireland beat England. In 1914 England beat Wales; Scotland beat England; Ireland beat England and Wales and drew with Scotland; and Wales drew with Scotland. In 1920 England beat Scotland and Ireland; Wales beat England and drew with Ireland and Scotland; and Scotland beat Ireland. The Football Association Cup was won in 1911 by Bradford City, in 1912 by Barnsley, in 1913 by Aston Villa, in 1914 by Burnley, in 1915 by Sheffield United, and in 1920 by Aston Villa. The championship of the Football League was carried off by Manchester United in 1911, by Blackburn Rovers in 1912, by Sunderland in 1913, by Blackburn Rovers in 1914, by Everton in 1915, and by West Bromwich Albion in 1920. The principal trophy of the Amateur Football Association was won in 1911 by the Old Malvernians, in 1912 by Oxford City, in 1913 by the New Crusaders, in 1914 by Ealing, and in 1920 by Dulwich Hamlet. The Arthur Dunn cup for public school clubs fell to the Old Reptonians in 1911, to the Old Malvernians in 1912, to the Old Brightonians in 1913, to the Old Reptonians in 1914, to the Old Wykehamists in 1920, and to the Old Carthusians in 1921. Oxford won the University match in 1911 and Cambridge won in 1912, 1913, 1915; in 1914 and 1920 the match was drawn.

American Football.—Of all amateur sports in America, college football (the American Rugby game) drew the largest crowds and aroused the greatest enthusiasm. Occasional professional teams drew big gate receipts, especially in Ohio and Michigan, where the professional game was popular, but in general it was not encouraged. After 1908 a number of colleges abandoned football because of the deaths and injuries that resulted from the old-style mass playing. In the following years, especially in 1910 and 1912, radical revisions of the old rules were made; the new rules were designed to foster a more open style of play and to make the game more interesting to spectators. The periods of play, formerly two halves of 35 min. each, were altered to four periods of 15 min. each, with an intermission of one minute between the first and second, and third and fourth periods, and 15 min. between the second and third periods. The playing field, from goal line to goal line, was shortened from 110 to 100 yd. and each side was given four trials in which to make the required 10 yd. The removal of the restrictions on the forward pass was one of the most conspicuous changes; this with other new rules, had the effect of encouraging an open, running game, in which the advantage lay rather in quick thinking and skillful playing than in mere weight or strength. The full possibilities of the new rules were not realized for some time, but, as familiarity with them increased, the play became more spectacular, and there was no question that the game had been improved from the standpoint of both spectator and player. Ordinarily the schedule of football games was not designed to determine the champion team among eastern colleges; therefore in reviewing the football games of the decade 1910–20 the choice of the strongest teams is to some extent a matter of opinion. From 1910 to 1915, inclusive, Harvard University had a succession of strong teams, which in nearly every year gained what appeared to be a clear title to the championship. The succession was interrupted in 1911, however, when Princeton defeated both Harvard and Yale. In the next year the honours went to the smaller colleges—especially the university of Pittsburgh and Colgate University—and this was interpreted as due in part to the fact that the new rules had removed certain handicaps from the less powerful teams. Football probably had never been so popular as in 1916; it was estimated that in that year 35,000 games were played throughout the United States, with an attendance of 6,500,000. Owing to the entrance of the United States into the war, the major teams practically cancelled their schedules during the two following years, but in the army and navy every unit had its team. A full schedule was played by the A.E.F., the winners being the 89th Div. team, captained and coached by Captain Gerhardt of West Point. The resumption of college games in the east in 1919 showed that college football had lost none of its popularity. One of the strongest teams of 1919 was that of Pennsylvania State College, though Harvard went through the season without experiencing defeat. Despite a tie with Harvard, Princeton was generally conceded to have had the best team turned out in the east in 1920, the first really normal year of play after the war. The tendency among colleges was more and more towards open play, with much kicking and forward passing. The east, however, continued to play a far more conservative game than was popular in the west and south. Among the colleges of the middle west the strongest teams were Michigan (1910), Minnesota and Michigan (1911), Wisconsin (1912), Chicago (1913), Illinois (1914), Illinois and Minnesota (1915), Ohio State (1916–7), Illinois (1918–9), Ohio State (1920). Ohio State, champions of the middle-west group in 1920, played an intersectional match at Pasadena at the Festival of Roses in that year with the university of California, and was badly defeated. The large attendance at football matches led to the construction of immense stadiums of concrete and steel to accommodate the crowds. Two of these stadiums, those at Harvard and at Syracuse University, had been constructed before 1910; after that year there were built a number of others, among which the most noteworthy were, perhaps, those at the university of Chicago, Yale (the "Yale Bowl"), the university of Michigan, Princeton (the Palmer Memorial stadium), the university of Pennsylvania and the college of the City of New York. The greatest of these structures, the Yale Bowl, has exterior dimensions of 940 by 744 ft. and a permanent seating capacity of 61,000. This huge amphitheatre cost more than $500,000 and is considerably larger than the Roman Colosseum, which had a seating capacity of about 45,000. The Palmer stadium at Princeton provides seats for 41,000 and cost $350,000.

The *Association* game made remarkable gains in popularity not only among American colleges and the country clubs, but among the big industries as well. Each year the United States Football Assn. conducted a national cup competition, the final round of which was won in 1920 by the Ben Miller Athletic Club of St. Louis from the Fall River Club of Quincy, Mass. Previous winners include the Bethlehem Steel Co., the Fall River Rovers, and the Brooklyn Field Club.

Baseball, the universal American sport, occupied the attention of the public in the United States chiefly as a professional game in which the leading cities were represented by baseball teams comprising two major leagues—the American and the National. At the end of each year the winning teams of the two leagues played what was known as the world series for the championship. During 1910–20 these contests were by far the most popular of all annual sporting events. This is indicated by the attendance and gate receipts, which in 1920 were 174,414 and $564,800, respectively, and in 1919, 236,928 and $722,414, as against an attendance of 125,222 and receipts of $173,980 in 1910. In the following list of world-series contests since 1910, the name of the winning team is given first, that of the losing team second, and the score in games third: 1910, Philadelphia (American League) *vs.* Chicago (National League), 4—1; 1911, Philadelphia (A.L.) *vs.* New York (N.L.), 4—2; 1912, Boston (A.L.) *vs.* New York (N.L.), 4—3, one game tied; 1913, Philadelphia (A.L.) *vs.* New York (N.L.), 4—1; 1914, Boston (N.L.) *vs.* Philadelphia (A.L.), 4—0; 1915, Boston (A.L.) *vs.* Philadelphia (N.L.), 4—1; 1916, Boston (A.L.) *vs.* Brooklyn (N.L.), 4—1; 1917, Chicago (A.L.) *vs.* New York (N.L.), 4—2; 1918, Boston (A.L.) *vs.* Chicago (N.L.), 4—2; 1919 Cincinnati (N.L.) *vs.* Chicago (A.L.), 5—3; 1920, Cleveland (A.L.) *vs.* Brooklyn (N.L.), 5—2. In 1914 an attempt was made to organize a third major league, known as the Federal, but this was unsuccessful, and at the end of the following season it was amalgamated with the two older leagues. After 1919 baseball was for a time under a cloud, owing to charges that certain members of the Chicago American League team had been bribed by outside persons to lose the 1919 world series. The accused players were expelled from organized baseball, and there was a general overhauling, with the result that final authority over the game was given to Kenesaw Mountain Landis, a Federal judge known for his proficiency in the law and his knowledge of baseball. During the World War American soldiers carried the game to England and France, where it was a favorite diversion in the camps of Canadian and U.S. soldiers. The professional game enjoyed an extraordinary revival after the war, the crowds breaking all records, especially since Sunday playing was more generally permitted by law than before. Colleges generally resumed the game, though interest in college baseball was slight in comparison with interest in college football.

Lawn Tennis.—American players, during 1910–21, were in the forefront, but an increasingly high standard of play was being shown among other nationalities besides the British and American, notably the French and Japanese. The International Davis Cup was won by Australia in 1911 and 1914, by the British Isles in 1912, and by the United States in 1913 and 1920. In 1911 the United States team (Larned, McLoughlin, Little and Bundy), were beaten by Australia (Brookes, Dunlop and Heath) after beating Great Britain (Dixon, Lowe and Beamish). In 1912 Great Britain (Dixon, Parke and Beamish) defeated Australia (Brookes, Heath and Dunlop). In 1913 the United States (Hackett, McLoughlin, Little and Williams) beat Great Britain (Parke, Dixon, and Roper-Barrett). In 1914 Australia (Brookes, Wilding, Dunlop and Doust) beat the United States (McLoughlin, Williams, Behr and Bundy); McLoughlin defeated Brookes in a memorable match (14–16, 6–3, 6–3), and Wilding by 6–2, 6–3, 2–6 and 6–2, but McLoughlin and Bundy lost the doubles to Brookes and Wilding. In 1920 the United States (Hardy, Johnston, Tilden, Williams and Garland) defeated Great Britain, France and Australia.

In the English singles (world's) championships A. F. Wilding won in 1911, 1912 and 1913; N. E. Brookes in 1914; G. L. Patterson in 1919; and W. T. Tilden in 1920 and 1921. Mrs. Lambert Chambers won the English ladies' singles in 1911, 1913 and 1914; Mrs. Larcombe in 1912; and Mlle. S. Lenglen in 1919, 1920 and 1921. In the English covered court championship A. H. Gobert won the singles in 1911, 1912, 1920 and 1921; Gobert and M. J. G. Ritchie won the doubles in 1911, Wilding and S. N. Doust won the doubles in 1912 and 1913. P. M. Davson won the English singles in 1913 and 1919. In 1914 Ritchie won the English singles and in 1914 and 1921 T. M. Mavrogordato and Davson won the doubles. In 1919 the English doubles were won by R. Lycett and R. W. Heath, and in 1920 by Gobert and Lycett.

In the United States, William A. Larned won the championship for the seventh time in 1911, his experience proving too much for the challenger, Maurice F. McLoughlin; the doubles went to Raymond D. Little and Gustave Touchard, while Miss Hazel Hotchkiss won the women's title for the third time. In 1912 McLoughlin won the American championship, Larned not being in the tournament; McLoughlin and Thomas Bundy won the doubles from Little and Touchard, and Mary Browne won the women's championship. The outbreak of war in 1914 robbed the Newport tournament of interest. The German team was interned in England on the way home. Meantime Williams won the national title, and McLoughlin and Bundy the doubles. In 1915 much attention was paid to building up the junior tournaments. There was no international competition. William M. Johnston, of California won the championship. With Clarence J. Griffin, another Californian, he also won the doubles. Miss Molla Bjurstedt (later Mrs. Mallory), won the women's championship. In 1916 the United States was the world's lawn-tennis centre. The season was marked by the appearance of two Japanese players, Kumagae and Mikami, in the principal tournaments. Williams won the national singles title, Johnston and Griffin the doubles. Miss Bjurstedt took every title she contested. In 1917, with the United States in the war, tennis was transferred to the army and navy, all the ranking 10 players being in the services. The "patriotic" singles, in lieu of a national championship, was won by R. L. Murray, a Californian settled in the east. In 1918 R. L. Murray won the title in straight sets from William T. Tilden. Tilden and Vincent Richards won the doubles title. In 1919 Johnston won the singles title from Tilden, while Brookes and Gerald Patterson, from Australia, took the doubles. Brookes, Patterson, Lycett and Thomas, of Australia, invaded the United States, but were beaten at Forest Hills, 4 matches to 0, by Johnston and Williams, and in the doubles by Tilden and Johnston. In 1920 Tilden won back the singles titles from Johnston, while Johnston and Griffin won the doubles.

Polo.—The United States retained the cup against England at Meadowbrook in 1911, winning by 2 to 0, the American team consisting of the famous "big four," Lawrence Waterbury and J. M. Waterbury (forwards), Harry Payne Whitney (No. 3), and Devereux Milburn (back); in 1913 the same team won again by 2 matches to 0. In 1914 Lord Wimborne's team took the trophy to Great Britain winning 2 straight matches from an American team consisting of Milburn, who played both 3 and back, the two Waterburys, and René La Montagne. In 1921 an American invasion of Hurlingham was led by Devereux Milburn, whose team, consisting of himself at back, J. Watson Webb at No. 3, Thomas Hitchcock, Jr., at No. 2, and Louis E. Stoddard at No. 1, brought the cup back to the United States winning 2 straight matches by 11 to 4 and 10 to 6.

Yachting.—Just before the outbreak of the war Sir Thomas Lipton renewed his challenge for the America's Cup, there having been no races since 1903. "Shamrock IV.," a much-criticized boat, was sent to a drydock in Brooklyn, while "Resolute" and "Vanitie" reappeared and contested the right to sail as defender. The thirteenth series of races for this trophy was not sailed until July 15–27 1920, off Sandy Hook. The challenger was designed by C. E. Nicholson and was sailed by Capt. William P. Burton, an amateur skipper. Capt. Andrew Jackson Applegate, an American familiar with conditions on this course, acted as professional pilot. The defender was "Resolute," winner of 7 out of 13 races against "Vanitie," 4 being won by the latter and 2 called off. "Resolute" was built by a syndicate of New York yachtsmen, composed of J. P. Morgan, Cornelius Vanderbilt, Arthur Curtiss James, George F. Baker and others. The skipper was the well-known amateur, Charles Francis Adams of Boston. The sailing-master was Capt. Chris Christensen, he and the mates being of Scandinavian birth but American citizens. The defender was designed by Nat. Herreshoff, of the Herreshoff family of Bristol, R.I. The first 2 races were won by "Shamrock," the last 3 and the cup by "Resolute." Twice the yachts failed to finish within the 6-hour time limit. Once the wind was deemed too strong to permit a start. It was feared that with lee decks awash there was risk of losing a man overboard. In all but one race "Resolute" was allowed 6 min. 40 sec. handicap, due largely to the challenger's great sail area with Marconi mast and extreme hoist. In the same year was held the first race for the championship of the North Atlantic fishing fleet off Halifax. "Esperanto," United States, defeated "Delawanna," Canadian, in two straight races over a 40-m. course, for $4,000 and a cup.

Golf.—In Great Britain, H. Vardon was the champion in 1911 and 1914, E. Ray in 1912, J. H. Taylor in 1913, G. Duncan in 1920, and Jock Hutchison in 1921. In the amateur championships H. H. Hilton won in 1911 and 1913, John Ball in 1912, J. L. C. Jenkins in 1914, C. J. H. Tolley in 1920 and W. I. Hunter in 1921. The ladies' open championship fell to Miss D. Campbell in 1911, to Miss G. Ravenscroft in 1912, to Miss Muriel Dodd in 1913, and in 1914, 1919, 1920 and 1921 to Miss C. Leitch.

In the United States the amateur championship was won by H. Hilton in 1911 and by Jerome Travers in 1912. J. J. McDermott won the open tournament both in 1911 and 1912. Travers defeated Anderson for the amateur title in 1913, and Francis Ouimet won the open title, after a tie with Harry Vardon and Ted Ray of England. No amateur before had won this title, and Ouimet was only 20 years old. Miss Gladys Ravenscroft, of England, won the American ladies' championship in 1913. In 1914 Ouimet defeated W. C. Fownes for the amateur title, and Walter Hagen won the open from a field of English, French and Scotch professionals; the women's title went to Miss Georgiana Bishop. The amateur title for 1915 went to Robert M. Gardner; and Jerome Travers won the open, the second triumph of an amateur. In 1916 "Chick" Evans took the amateur title from Gardner, and the open from the professional Jock Hutchison. With the United States at war in the following year golf was abandoned save as exhibitions were given in aid of the Red Cross. The first revival came in 1918 with a match in Canada between American and Canadian amateurs, which was won by the Canadians, 23 to 19. A complete revival followed in 1919; S. Davisson Herron won the amateur title, though four former champions, Travers, Gardner, Ouimet and Evans, were entered. "Bobby" Jones was the runner-up. The open was won by Walter Hagen, while Miss Alexa Stirling easily took the women's title. Gardner went to England in 1920 for the amateur championship, and was only beaten in the final, after an extra hole, by Cyril J. Tolley, the Oxonian. Ray and Vardon made this year a remarkable invasion of the United States, Ted Ray winning the open championship. The amateur title went to Evans. The U.S. team easily won the Devonshire Cup from Canada. In 1921 an American invasion of England by the strongest of professional and amateur teams resulted in the winning of a team match by the Americans, and of the open championship by Jock Hutchison, of St. Andrews, a naturalized American.

Horse Racing.—The following is a list of the winners of the Derby in England from 1911 to 1921:—

	Winner	Owner	Trainer	Jockey
1911	Sunstar	Mr. J. B. Joel	C. Morton	G. Stern
1912	Tagalie	Mr. Raphael	D. Waugh	J. Reiff
1913	[1]Aboyeur	Mr. Cunliffe	Lewis	Piper
1914	Durbar II.	Mr. H. B. Duryea	(trained in France)	MacGee
1915	[2]Pommern	Mr. S. B. Joel	C. Peck	S. Donoghue
1916	[2]Fifinella	Mr. E. Hulton	R. C. Dawson	J. Childs
1917	[2]Gay Crusader	Mr. Fairie	A. Taylor	S. Donoghue
1918	[2]Gainsborough	Lady James Douglas	A. Taylor	J. Childs
1919	Grand Parade	Lord Glanely	Barling	F. Templeman
1920	Spion Kop	Major G. Loder	Gilpin	F. O'Neill
1921	Humorist	Mr. J. B. Joel	Morton	Donoghue

[1] Craganour, who came in first, was disqualified.

[2] "New Derby" run at Newmarket.

Other "classic" races resulted as follows:—

	Oaks	Doncaster St. Leger	2,000-guineas Newmarket	1,000-guineas Newmarket
1911	Cherimoya	Prince Palatine	Sunstar	Atmah
1912	Mirska	Tracery	Sweeper II.	Tagalie
1913	Jest	Night Hawk	Louvois	Jest
1914	Princess Dorrie	Black Jester	Kennymore	Princess Dorrie
1915	[1]Snow Marten	Not run	Pommern	Silver Tag
1916	[1]Fifinella	Not run	Clarissimus	Canyon
1917	[1]Sunny Jane	" "	Gay Crusader	Diadem
1918	[1]My Dear	" "	Gainsborough	Ferry
1919	Bayuda	Keysoe	The Panther	Roseway
1920	Charlebelle	Caligula	Tetratema	Cinna
1921	Love in Idleness		Craig an Eran	Bettina

[1] Run at Newmarket.

In 1914, before the season was half over, came the war. During most of August racing was suspended, partly because of difficulties of transit and also because some courses were occupied by the military. Owing largely to the King's desire that the interests of the many people employed in racing establishments should not be endangered, the remaining fixtures were carried out, so far as regarded the more important ones. For the first time since 1865 the Derby was won by a horse bred and trained in France, Durbar II. On May 16 1915 the Jockey Club issued a notice suspending all racing under their jurisdiction, except the Newmarket fixtures, until further notice. Substitute races for the Derby, Oaks and St. Leger were arranged at Newmarket.

In the United States, too, horse-racing was interrupted by the war, but there was a prompt revival afterwards. In 1920 Man-O'-War, a chestnut colt by Fair Play-Mahubah, from the Glen Riddle Farm, and trained by Louis Feustel, started in 21 races, winning 20 and taking one second. Its total winnings amounted to $244,465. Man-O'-War held the American running records for 1 m. (1 min. $35\frac{4}{5}$ sec.), $1\frac{1}{8}$ m., $1\frac{3}{8}$ m. and $1\frac{5}{8}$ m. The climax of the 1920 season was a match race between Man-O'-War, owned by Samuel Riddle, and Sir Barton, owned by Commodore Ross of Canada, at a mile and a quarter, at the Kenilworth track, Windsor, Ont. The race was for a purse of $75,000 and a $5,000 cup offered by A. M. Orpen. Man-O'-War won by seven lengths in 2 min., 3 sec., three seconds slower than the record made by Whisk Broom II. in 1913.

Rowing.—For the professional championship of the world, the following contests took place:—

1910—R. Arnst beat E. Barry on Zambesi.
1911—R. Arnst beat H. Pearce on Parramatta.
1912—E. Barry beat R. Arnst on Thames.
1912—E. Barry beat E. Durnan on Thames.
1913—E. Barry beat H. Pearce on Thames.
1914—E. Barry beat J. Paddon on Thames.
1919—A. D. Felton beat E. Barry on Thames.
1920—E. Barry beat A. D. Felton on Parramatta.

In England the winners in the Oxford and Cambridge boat races for 1911–21 were:—

1911	Oxford	1915–9	Not rowed
1912	Oxford	1920	Cambridge
1913	Oxford	1921	Cambridge
1914	Cambridge		

In the 1912 races, as originally rowed, both boats became waterlogged and Cambridge sank. But the race was rowed again the following Monday, Oxford winning.

American rowing, interrupted by the war, was promptly revived, and assumed an international character when in 1920 the veteran crew of the U.S. Naval Academy at Annapolis defeated a picked English eight over the canal course at Brussels for the Olympic championship. In 1921 the Annapolis crew, with two new men in the boat, was defeated by Princeton University in a race on Carnegie Lake, over a course of a mile and three-quarters. The same Annapolis crew in the same year won the revival of the Poughkeepsie Regatta over three miles, easily defeating California, Cornell, Pennsylvania, Syracuse and Columbia, the last named up to that time an unbeaten combination. Yale defeated Harvard in 1921, on the Thames river at New London, Conn., at four miles, using English rigging and boat, and being coached in the last two weeks by James Corderry, an English sculler, who had succeeded Guy Nickalls at the eleventh hour as coach at New Haven. In 1920 Harvard beat Yale, but the previous year Yale won under the coaching of Prof. Mather Abbott, an Englishman who had taught rowing for many years at St. Paul's School, Concord. Syracuse in 1916 won the Poughkeepsie Regatta under the coaching of James A. Ten Eyck. In 1920 Charles E. Courtney, Cornell's rowing coach, the foremost of American coaches, died. The winners of the American Intercollegiate regatta after 1909 were Cornell (1910, 1911 and 1912), Syracuse (1913), Columbia (1914), Cornell (1915), Syracuse (1916 and 1920), Annapolis (1921). The Yale-Harvard races were won as follows: Harvard (1910, 1911, 1912, 1913), Yale (1914 and 1915), Harvard (1916), Yale (1919), Harvard (1920), Yale (1921).

Boxing.—The official maximum boxing weights (Great Britain and the United States) are as follows:—Flyweight, 8 st. (112 lb.); Bantamweight, 8 st. 6 lb. (118 lb.); Featherweight, 9 st. (126 lb.); Lightweight, 9 st. 6 lb. (132 lb.); Welterweight, 10 st. 7 lb. (147 lb.); Middleweight, 11 st. 6 lb. (160 lb.); Light-Heavyweight, 12 st. 7 lb. (175 lb.); Heavyweight, no maximum.

In 1920 the official list of the world's champions was:—*Flyweight*, Jimmy Wilde (Gt. Britain); *Bantamweight*, Peter Hermann (U.S.A.); *Featherweight*, Johnny Kilbane (U.S.A.); *Lightweight*, Benny Leonard (U.S.A.); *Welterweight*, Jack Britton (U.S.A.); *Middle*, Mike O'Dowd (U.S.A.); *Heavy*, Jack Dempsey (U.S.A.).

The results of the Amateur Boxing Association Championships in England were as follows in 1911–4:—

	Bantamweight	Featherweight	Lightweight
1911	W. W. Allen	H. Bavers	A. Spenceley
1912	W. W. Allen	G. R. Baker	R. Marriott
1913	A. Wye	G. R. Baker	F. Grace
1914	W. W. Allen	G. R. Baker	R. Marriott

	Middleweight	Heavyweight
1911	W. Child	W. Hazell
1912	E. V. Chandler	R. Smith
1913	W. Bradley	R. Smith (walked over)
1914	H. Brown	E. V. Chandler

In professional contests the bantamweight championship of England was won by Digger Stanley against Alec Lafferty in 1912, by B. Beynon in 1913 (*vs.* Digger Stanley) and by Curly Walker in 1914 (*vs.* C. Ledoux). Fred Welsh was the lightweight champion of England in 1912 (*vs.* Matt Wells), 1913 (*vs.* H. Mehegan) and 1914 (*vs.* W. Ritchie). Johnny Summers was the welterweight champion of England in 1912 (*vs.* Arthur Evernden) and 1913 (*vs.* S. Burns). Jack Harrison was the middleweight champion of England in 1912 (*vs.* Private McEnroy). In 1913 (*vs.* Packy Mahoney) and 1914 (*vs.* Colin Bell) Bombardier Wells was the heavyweight champion of England, and in 1913 (*vs.* Alec Lambert) Kid Lewis was the featherweight champion of England. In 1912 Jim Driscoll (Cardiff) won the featherweight championship of the world against Jean Poesy (France); Jack Johnson (America) (heavyweight champion of the world) beat Jim Flynn (America); Georges Carpentier (France) beat Jim Sullivan (England); Frank Klaus (America) beat Carpentier; Billy Papke (America) beat Carpentier.

In 1913, in the middleweight championship of the world, F. Klaus beat Billy Papke; in lightweight championship of the world F. Welsh beat H. Mehegan; in featherweight championship of the world, J. Driscoll and Owen Moran drew; and in heavweight championship of Europe, Carpentier beat Bombardier Wells.

In 1914, in lightweight championship of the world, F. Welsh beat W. Ritchie; and in heavyweight championship of Europe, Carpentier beat Gunboat Smith.

In 1915, at Havana, Jess Willard defeated Jack Johnson in the 25th round for the world's championship.

In 1919, at Toledo, U.S.A., Jack Dempsey beat Jess Willard (holder) for the world's championship in the 3rd round.

On Dec. 4 1919, at the Holborn Stadium, London, Carpentier beat Joe Beckett in a fight for the heavyweight championship of Europe. Beckett was knocked out in the first round after the fight had lasted one minute fourteen seconds. In 1921 Carpentier was beaten at Jersey City, U.S.A., by Dempsey, in the 4th round, in a contest for the heavyweight championship of the world, the greatest interest having been excited by this fight.

Swimming.—American swimmers in 1920 held a majority of the world's records. A large number of these records were held by three men—Duke Kahanamoku of Hawaii, Perry McGilvray of Chicago and Norman Ross of San Francisco. Kahanamoku won the 100-metre race at the Olympic games of 1920, establishing a new world's record of 1 min. ⅖ sec. Ross was winner in two events (400 metres and 1,500 metres); Warren Kealoha of Honolulu was victorious in the 100-metre backstroke race, and the American team carried off the honours in the 800-metre relay. Two races were lost to Swedish swimmers. American women also proved themselves good swimmers, one of their triumphs was the defeat in 1919 of two Australians, Miss Fanny Durack and Miss Wylie, who visited the United States in that year. The victorious Americans were Miss Ethelda Bleibtrey and Miss Charlotte Boyle, both of Brooklyn. Miss Bleibtrey won a number of races at the Olympic games in 1920, where she established a record of 4 min. 34 sec. for 300 metres open water.

English Billiards.—Since the prohibition of consecutive spot hazards and the push stroke, English professionals have relied chiefly upon the top-of-the-table game. An innovation, however, was introduced in 1911 by the Australian, George Gray, who repeatedly made huge breaks by means of a series of losing hazards from the red ball. In all, he scored 24 breaks of four figures, of which the highest was 2,196. Gray invariably declined to play matches with ivory balls, and these breaks were not made under Billiard Association rules. H. W. Stevenson, though not at his best in 1911, beat M. Inman twice for the championship of the Billiards Control Club. In Jan. 1912 George Gray met Stevenson and defeated him in two games out of three of 18,000 up. M. Inman beat T. Reece for the Billiard Control championship in 1912, 1913 and 1914. In 1919 Inman beat Stevenson in the Billiard Association championship by 6,532 points in 16,000. In 1920 W. Smith beat C. Falkiner in the Billiard Association championship by 1,500 points in 16,000. In 1921 Newman beat Reece in the professional championship by 5,256 points in 16,000.

In 1911 H. A. O. Lonsdale did not defend his title of amateur champion, and the cup reverted to H. C. Virr. An alteration was made in the arrangements, the champions of England, Ireland, Scotland and Wales meeting in competition in the finals. Virr beat Major Fleming by only seven points in 3,000 for the amateur championship in 1912. The influence of Gray's example was plainly perceptible in this competition in the use made of the losing hazard. In 1913 Virr beat J. Nugent by 1,044 points in 3,000 and in 1914 by 1,962 in 3,000. In 1914 the Scottish championship was won by A. Croneen, and the Welsh championship by A. Paton. In 1915 the United Kingdom Amateur Championship was won by A. W. T. Good (England) by 3,000 points to 2,716. In 1918 it was won by Graham Symes by 2,000 points to 1,721. In 1919 S. H. Fry won the Amateur championship by 2,000 points to 1,729, but in the Billiard Control Club's Amateur Championship Tournament was beaten by Major Fleming by 2,000 points to 1,903. In 1920 Fry again won the Amateur Championship, by 3,000 points to 2,488.

A break of 1,016 was made by Stevenson in 1912 against W. Cook, without a series of spot strokes, anchor cannons or long successions of losing hazards. Stevenson made a break of 919 in 1913, and in the same year M. Inman made one of 894. In 1903 the amateur S. H. Fry made a break of 236.

Archery.—The opportunity may be taken here to correct the earlier article on ARCHERY in some particulars. The bow now used by men is from 6 ft. 1 in. to 6 ft. 4 in. in length; a lady's bow ranges from 5 ft. 6 in. to 5 ft. 8 in., measured between the nocks; these lengths according in the one case with an arrow of 27 in. to 28 in. and in the other with an arrow of 25 in. to 26 in. Exceptionally long arms may render necessary an arrow an inch longer and a corresponding addition of one or two inches to the bow. The "weight" of a bow is the number of pounds required, when appended to the string, to draw to the head an arrow of 28 in. for a man's bow or 25 in. for a lady's. The weight of men's bows varies from 36 lb. to 58 lb., of ladies' from 18 lb. to 30 lb., the lighter weights being sufficient for beginners. Bows are styled "self" or "backed" according as they are made of one wood or of two or more glued together. "Self bows," if of yew, are usually made of two pieces joined by a double fish splice at the handle: as it is difficult to find a piece of this wood (incomparably the best) of sufficient length while free from knots. If made of lance they are invariably of a single piece. "Backed bows" may be of yew, backed either with the same wood or with hickory; or alternatively of washaba or of ruby, lance, or other woods backed with hickory; the back being the flat side of the bow, and the "belly" the rounded side. Three woods are sometimes employed, a thin strip of fustic being interposed between a belly of yew and a back of hickory. There should be an inflexible centre of about 21 inches, whence the bow should taper gradually towards each end. It should be straight, the back true, and, when strung, the string should appear to cut the belly into two equal parts. Self yew bows are the best. They are light in the hand, the sweetest to pull, and have the best cast; but they require careful handling. They are also expensive, costing from £5 to £15, and they are liable to "crysals," or tiny cracks, which gradually spread until the bow breaks. A yew backed yew, which is next in merit, can be bought for £5 and is somewhat less liable to crysals. Between the others there is little to choose, provided that they are properly made, and not "reflexed," as they are said to be when the ends bend outward; for these jar the hand. Their price varies from 25s. to 3 guineas. The string for a man's bow should be from 6 in. to 6¾ in. from the back of the bow when strung; for a lady's from 5¼ in. to 6 in., according to the length of the bow. The nock of arrows—it is never called the "notch"—should not be "cut square" but rounded. The feathers must be wing and not body feathers, which are quite useless. They should be from the same wing, *i.e.* right or left, about 1½ in. long and tapering to the front from a depth of ½ in. at the nock. If balloon-shaped, their greatest depth should be at one-third of their length from the nock-end.

With regard to target scoring and handicapping it should be noted that a St. George's Round has never been shot at a public meeting, or, indeed, at any meeting held within the last 60 years. Handicapping by the loss of rings has been obsolete for more than 35 years, nor is there any system which can rightly be called handicapping by points. Handicapping is now carried out either by dividing the archers into classes according to their powers, or by deducting percentages from their scores for previous successes.

As regards the history of archery, some corrections may also be made. The bow was used in war at a later date than 1860, viz. by the Japanese against the English at Surni Nosake, September 5 1864. Nor did the Armada year see the last appearance of the English archer. A company of archers was raised for the expedition to the island of Rhè in 1627. There were archers among the Russian troops in the Crimea. Again, the relation of Finsbury Archers, the Hon. Artillery Company and the Royal Toxophilite Society requires restatement. In July 1676, William Wood, Marshal of the Finsbury Archers, was sent round with a paper, signed by Sir E. Hungerford and others, setting forth that the "officers and others of the Society of Archers, within the cities of London and Westminster" have determined "that the bearer shall have a silver badge and bear the same as Marshall to the Queen's Majesty's Regiment of Archers." The names of the subscribers were appended (Guildhall MSS. 193). Consequently this badge or shield had no connexion with Oxford. The Finsbury Archers became extinct about 1761, but the Royal Toxophilite Society was not founded until 1781, when Mr. P. Constable, the last captain of the Finsbury Archers, joined it and handed to it the shield and other valuables. There was, therefore, no combination of the two clubs in 1841. It is incorrect to assert that the Finsbury Archers were not connected with the Hon. Artillery Company. They were connected, and under their powers shot over the Finsbury Fields up to 1657. The Archers' Division of the Hon. Artillery Company was formed by members of the Royal Toxophilite Society in 1784. (X.)

SPRING-RICE, SIR CECIL ARTHUR (1859–1918), English diplomatist, was born in London Feb. 27 1859, the second son of the Hon. Charles Spring-Rice (1819–1870), sometime assistant under-secretary for foreign affairs, and grandson of the 1st Baron Monteagle. He was educated at Eton and Balliol College, Oxford, and entered the Foreign Office in 1882, becoming private secretary to Lord Granville in 1884 and précis writer to Lord Rosebery in 1885. He went to Washington as third secretary in 1886, and after various brief appointments went in 1895 to Berlin. In 1898 he became secretary at Teheran, and from there went in 1901 to Cairo as British commissioner on the Caisse de la Dette. In 1903 he went to St. Petersburg, first as secretary and later as councillor of embassy, remaining in Russia during the war with Japan of 1904–5 and the revolution of 1905. In 1906 he was sent to Persia as minister, having lately been created K.C.M.G., and his stay there coincided with the period of the delicate negotiations which preceded the signing of the Anglo-Russian agreement of 1907. In 1908 he was created G.C.V.O. and went to Sweden as minister, and in 1912 was appointed ambassador to the United States. Ill-health, however, prevented his undoubtedly brilliant capacity from making his work at all prominent during his tenure of this position. He died at Ottawa on his way home to England Feb. 14 1918. He married in 1904 Florence, daughter of Sir Frank Lascelles, and left two children.

SQUIRES, RICHARD ANDERSON (1880–), Newfoundland politician, was born at Harbour Grace, Newfoundland, Jan. 18 1880. He was educated at the Methodist College, St. John's, and Dalhousie University, Halifax. In 1902 he was admitted a solicitor, and in 1911 was called to the bar (K.C. 1914). In 1909 he entered the Legislature as Liberal member for the Trinity district, for which he sat until 1913. In 1914 he became Minister of Justice and Attorney-General, from 1914 to 1917 was a member of the Legislative Council, and from 1917 to 1918 Colonial Secretary. He was nominated leader of the Liberal party in Aug. 1919, and the same year became Prime Minister.

STAFF, MILITARY (*see* 25.752).—One result of the unqualified success which Prussian arms achieved in the wars of 1866 and 1870–1 was that the general staff principle, which had so largely contributed to give victory to the hosts controlled by von Moltke in those contests, was adopted by almost every military power during the last quarter of the 19th century. The exact nature of the arrangements necessarily varied in different countries, but the ideals sought after were the same. Thus in the different staff organizations as they were constituted in peace-time, work in connexion with devising plans for offensive operations and for ensuring territorial defence, duties dealing with the collection of military information, the superintendence of the education of officers, the conduct of manœuvres and the training of troops, were kept as far as possible distinct from administration—"*adjutantur*," as the Germans call it. Before the year 1900 most armies possessed a general staff which was more or less in close touch with its Government on the one hand and, thanks to its ramifications, with the troops on the other.

Only two of the more important nations—the United Kingdom and the United States—adhered for all practical purposes to previously existing systems, under which preparation for war was relegated to the background in staff duties. It is true that in either state certain improvements were effected by the military authorities, tending towards ensuring that at least some of the functions properly performed by a general staff should be allocated to special branches of the staff; but, such as they were, they did not go very far. Then came the S. African War of 1899–1902. The difficulties and disappointments encountered by British military forces in that protracted struggle, coupled with the unsatisfactory working of the staff in the field (especially in its higher grades) during the progress of the operations, made plain the need of reform, and the War Office was considering the question of far-reaching modifications of the system in force when, in 1904, the Government suddenly set up a "War Office Reconstitution Committee" charged with the duty of reorganizing the central administration of the army. The committee recommended a number of drastic alterations, but by far the most important of its proposals was that a General Staff Department, which was to constitute the foremost branch of the professional side of the War Office, should be created forthwith out of certain existing sections, with entirely new sections superposed. The committee further urged that a general staff organization, acting under the aegis of, and in close touch with, the general staff in Whitehall, should be introduced into military districts and commands. The recommendations of the committee were accepted by the Government, and so it came about that a British general staff was established ten years before the outbreak of the World War. During those ten years remarkable progress was made, and when the nation was confronted by the tremendous emergency of Aug. 1914 it had at its disposition a body of well-trained general staff officers, sufficient for the comparatively small army that was available to take the field at the opening of hostilities, although totally insufficient to meet the requirements of the vast forces which had to be improvised after war had broken out. The Government of the United States was still later than that of the United Kingdom in establishing a general staff of the kind that Scharnhorst had thought of a century before. This was only set on foot in 1911, six years before the entry of the Republic into the great conflict which was to upset so many preconceived ideas on the subject of conducting war, but which was to prove—even more conclusively than had the Franco-German War and the Japanese triumphs of 1904–5—how imperative it is under modern conditions for a state which embarks upon a serious struggle with a foreign foe to have an efficient and suitably organized military staff at its command. Owing to the very small number of trained general staff officers that were available when the country became committed to hostilities on a vast scale, the U.S. forces were even worse equipped in this respect when they took the field in Europe than were those of the United Kingdom in their greatly expanded form.

The remarkable progress that has taken place in science of recent years has tended to impose some entirely new duties upon military staffs, brought about their expansion in certain directions, and even necessitated the creation of some entirely new branches as part of their organization. There is, for instance, in the first place that development in railway communications which has occurred in most civilized countries and in many possible and actual theatres of war, as also the contriving of numberless devices by which the construction of new lines of rail is facilitated during operations in the field. Then again there is the question of electric communications, which to-day play so conspicuous a part in war. Improvements in small arms and in ordnance have brought it about that the volume of ammunition needed for the weapons in the hands of troops has come to be out of all proportion to the amount which experience had proved to be ample in campaigns of the past. Developments in mechanical traction are giving this an ever-increasing military importance, not merely from the point of view of the supplying of armies but also from that of their tactical employment. The appearance of the tank on the battlefield is another feature of very recent date which tends to increase staff work. Finally, there is the establishment of air power which has introduced a factor of incalculable importance as affecting the control of belligerent armies; whether the combatant aeronautical service of a nation form part of its military organization or be independent, its operations in time of war impose duties upon military staffs such as had not to be performed by them in any contest previous to the World War. In some cases it is mainly the general staff that finds its labours increased by these modern developments, in other cases the new work falls rather upon the administrative staff. But in all cases both subdivisions of the staff are, at least to some extent, affected.

One most important duty which devolves upon the general staff in a State compelled by its geographical position and by political and international problems to maintain fighting forces both by sea and by land is the establishing and the maintenance of intimate relations with the naval authorities. Such conditions prevail in the case of most maritime nations, and, where this is so, it is imperative that the two services shall be capable of effective coöperation in the event of war. Effective coöperation when an emergency arises can only be ensured if the military staff has been in close touch with the corresponding naval staff in time of peace. Much attention had fortunately been paid to this question in the United Kingdom during the period that intervened between the creation of the British general staff and the outbreak of the World War. Permanent contact existed between the thinking branches of the Admiralty and of the War Office. Problems which might possibly arise in the future had been examined by them in conference, principles of action had been laid down, details had been worked out, and to this is to be attributed the secrecy and the smoothness with which the British Expeditionary Force was transported across the Channel to France during the fortnight succeeding the declaration of war in 1914. Moreover, thanks to their being brought into contact at staff rides with naval officers and to the happy relations which existed between these two services, British general staff officers as a body had studied and were acquainted with naval doctrine and naval procedure, a great advantage when, as was the case at the Dardanelles, operations partook of an amphibious character. General staffs on the Continent did not, on the other hand, prove to be equally well-informed as to maritime conditions; this was made apparent during discussions such as often took place between military authorities representing the different Allies, concerning the policy which ought to be pursued in the Near East and other problems in which sea-power was necessarily involved. It is only natural, however, that a military staff which is representative of a sea-faring people should devote more attention to such subjects than will that of a non-maritime nation or of a nation possessing small maritime interests and limited maritime resources.

When a country elects to make of its air service a department of State distinct from the army, as has happened in the United Kingdom, it necessarily falls to the lot of the military general staff to maintain those intimate relations with the aerial general staff by which alone mutual coöperation can be secured in time of war. Under such circumstances the military general staff stands towards the air service as it does to the navy.

"War," said Clausewitz, "is only a continuation of State policy by other means," and elsewhere that "none of the principal plans which are required for a war can be made without an insight into the political relations." It was a recognition of this truth on the part of her Government that led to the triumphs of Prussia, first over Austria and then over France, in the days of von Moltke, the foremost professional interpreter of Clausewitz' doctrines. The executive in Berlin had during the middle decades of the 19th century been working hand in hand with the general staff. Sadowa and Sedan were the outcome. The history of the short-lived German Empire indicates that in later years a tendency made itself felt for the general staff to attempt to direct, and even partially to succeed in directing, the policy of the Government. A system of genuine militarism in its worst form began to creep in, which in due course brought untold disasters on the German people; but the passages quoted above from the great Prussian military writer do not inculcate anything of that kind. What they do inculcate is that there should be at all times an intimate understanding between what has been called the "brain of the army" and the civilian executive at the head of the State. The truth is that any Government which understands its business will always, when any question of a delicate nature arises between it and the rulers of some foreign Power, keep itself fully acquainted with the resources at command for enforcing its wishes should a quarrel supervene. If, moreover, the most is to be made of such fighting force as a country will dispose of in the event of finding itself in a state of belligerency with some neighbour, it is indispensable that the military—as also naval—authorities shall have made beforehand a study of the strategical situation that will, as far as can be foreseen, arise when hostilities break out. It is also indispensable that those authorities shall have been made aware in advance of the likelihood of the struggle's taking place. It is on the central directing branch of the general staff, *i.e.* on the General Staff Department at the War Office in the case of the United Kingdom, as it was on the "Great General Staff" of the days of von Moltke and the German Empire, that devolves the duty of maintaining relations with the Government and of advising it regarding the military aspect of problems created by the international situation. That central directing branch of the general staff is entitled to expect that the Government shall keep it fully *au courant* with the political conditions of the day.

The merits of the doctrine preached by Clausewitz seem to be self-evident, but leaders of opinion in the United Kingdom were slow to realize its importance. There existed an almost unaccountable inability to perceive the dangers to which a State unprepared for emergencies is exposed. When a Royal Commission presided over by Lord Hartington virtually recommended the setting up of a general staff in 1889, one of its members, a prominent politician who at a later date came to be Prime Minister, actually—in one of the most fatuous documents ever written by a public man—objected to the proposal on the grounds that, owing to its peculiar position, Great Britain had no need to study possibilities of conflict in advance. With such ineptitude in influential quarters, the bitter experiences of the S. African War were required to awaken British statesmen to a realization of their responsibilities. The lessons of that contest were to some extent learnt. By the setting up of the Committee of Imperial Defence, in which professional opinion was given a powerful voice, some preliminary steps had been taken in the right direction even before the creation of the general staff in 1904, and, subsequent to that date, the general staff at the War Office has been constantly consulted by the British Government and has been kept well-informed on all points of importance connected with the international situation.

How, as a matter of administration, the relations between the general staff and the executive are to be governed, and by what process communications between them are to be carried out, necessarily depends upon the political system in vogue in the state concerned. In any country possessing representative institutions the general staff can only be acting in a consultative capacity, at all events in peace-time. In the United Kingdom in the years preceding the World War the Chief of the Imperial General Staff and the Director of Military Operations were *ex-officio* members of the Committee of Imperial Defence. When strategical or administrative questions in which military force was or might be concerned were to be discussed by the committee, documents setting out the general staff view on the subject were laid before it by the general staff representatives. The decision of the committee on the points under discussion was taken and recorded, and executive action sometimes followed if it was involved by the decision. But although the more prominent members of the Government were included in it, the committee itself was merely a consultative body, and no executive action involving expenditure could follow on one of its decisions without the obtaining of at least nominal Cabinet sanction. Such recommendations were liable to be vetoed on account of the expense by the committee without reference to the Cabinet. Moreover, it did not necessarily follow that the view of the general staff would be accepted by the committee even on academical questions.

An interesting example of the working of the system is provided by the story of the Dardanelles. The expediency of an attack upon the Straits in the event of a war with Turkey was gone into by the committee as an academical question in 1906. The general staff were opposed to such a venture and the Admiralty representatives in the main agreed with them, the committee decided that the undertaking would in the event of a contest be inadvisable, and the result was that study of the subject on the part of the general staff virtually ceased. When early in the World War the project was brought up afresh by the First Lord of the Admiralty, the decision which the Committee of Imperial Defence had arrived at eight years before was ignored, and when the operations were undertaken their progress was hampered by lack of information, owing to the general staff's having acted on that decision and having to some extent abandoned research with regard to the topography, the resources and so forth of this potential theatre of war. But experience proved that the general staff had been right.

When hostilities arise some instrument a good deal more effective than a consultative committee is needed to control conduct of the war, and, from Aug. 1914 to the date of the Armistice, the operations were, in the case of the United Kingdom, for the first two and a half years of the struggle under supreme charge of various forms of war council directly representative of the Cabinet and given a free hand by that body. They were later under supreme charge of the specially established War Cabinet. The general staff was practically always represented at the meetings of the war councils and of the War Cabinet, but purely in an advisory position without voting power. They were responsible to the council or the Cabinet for the advice they gave, but the council or the Cabinet was responsible to the country for accepting or rejecting that advice. It is true that as a result of somewhat peculiar conditions that held good in the early days of the struggle, attributable partly to the unique personality of Lord Kitchener and partly to the weakening of the general staff at the War Office when its cream was skimmed off and dispatched to the Continent, the influence of the brain of the army was not for a time exerted very effectually in the councils of the Government. But that was only a passing phase. At a later stage the general staff was always at least allowed to express its views, even if its opinion was not necessarily accepted.

As a matter of fact its opinion was occasionally ignored in questions of considerable importance. This was no doubt partly due to some want of confidence in its judgment felt in Government circles owing to the slow progress made towards victory, and partly due to the personality and the temperament of certain members of the Government itself. The general staff also must have been sometimes at fault on occasions when its advice was rejected, although, should the full facts ever be made known impartially, posterity will probably pronounce it usually to have been right. Still, a general staff, however well-organized it may be and however gifted and informed its personnel, is not infallible. That this is so was demonstrated in the protraction for years of the World War, whereas the British general staff had at the outset confidently reckoned on its only lasting some months. The German general staff, again, looked with contempt upon the huge forces that Lord Kitchener was known to be improvising, until the value of the British "New Armies" was proved up to the hilt in the field; and at a later stage of the struggle it totally miscalculated and underestimated the military potentialities of the United States. Moreover, all the European general staffs alike, in their forecasts made in time of peace, underrated the wastage in personnel and the expenditure in ammunition in a modern campaign on a great scale.

It has been said that a general staff must "think politically." If this maxim is merely to be taken as meaning that a general staff should appreciate political habits of thought, watch political tendencies, and keep itself acquainted with the political aspects of every question influencing military action alike in peace and in war, its truth is indisputable. But one of the most important duties falling to the lot of a general staff, especially in times of emergency, will often be to strive to prevent mere policy from adversely influencing the conduct of operations of war or affecting Government decisions in connexion with military subjects. History provides some striking examples of political considerations gravely prejudicing the prospects of armies in the field. MacMahon's fatal march to Sedan was a case in point. The retention of Gen. Penn Symons' advanced force at Glencoe in the opening days of the Natal campaign of 1899 furnishes another instance. Had the question at issue been regarded solely from the soldier's point of view, it is more than doubtful whether Gen. Townshend would ever have been launched on his ill-omened effort to reach Bagdad in Nov. 1915. When problems of this kind present themselves, a general staff will often have a difficult and delicate rôle to play. But the golden rule to govern its conduct on such occasions would seem to be that it ought to regard and present the problem from the fighting point of view alone. The politicians can look after the political side.

It cannot be too clearly understood that neither in the United Kingdom nor in any other military state does the staff of an army in reality consist of a general staff alone. There must always be what, for lack of a more distinctive nomenclature, is called in the British service its "administrative" side—although in point of fact many of the duties of a general staff are necessarily of an administrative character. It is indeed the case that, at least in peace-time, the administrative staff of an army is in a sense the more important of the two. The army has to be recruited and fed and clothed and equipped, and its discipline has to be maintained, otherwise there will be no troops for the general staff to dispose of and there will be no *raison d'être* for the general staff. Whereas the general staff will often in peace-time be engaged on work which in the event may prove of little profit, the administrative staff is constantly busy disposing of questions which if not dealt with will cause a collapse. Calling the administrative staff "*adjutantur*" may alter its status and may lower its dignity, but does not alter the fact that it is a staff and that it performs staff duties. The organization as affecting the administrative staff that was introduced into the War Office in the United Kingdom in 1904, and in due course extended throughout the army (the details of which have been touched upon in earlier paragraphs), worked extremely well both at headquarters and with the troops during the pre-war period, and it also gave good results when subjected to trial at manœuvres between 1909 and 1914. The same staff organization was extended to India shortly after it came into force in the United Kingdom. Nor, when it came to be put to the test in warfare on a gigantic scale in many parts of the world, was it found wanting. Although the problems engaging the attention of the quartermaster-general's staffs and the inspector-general of communications' staffs were in many respects fundamentally the same in the Gallipoli Peninsula, in Mesopotamia, and in France and Flanders, the wide differences in the geographical and topographical conditions as between the three theatres of war obliged the problems to be solved on separate lines in each case. In France and Flanders several railways connected the troops at the front with the secure and well-equipped ports that acted as bases. In the Gallipoli Peninsula open beaches under fire served for bases, and the communications were to all intents and purposes maritime. For most of the time in Mesopotamia it was a case of an army dependent on one single line of river communication, hundreds of miles long, although the river was gradually to some extent supplemented by specially constructed sections of railway. And yet the organization of the administrative staff as it had been designed in peace-time met requirements under these diverse sets of circumstances. Where failures occurred, they were due to errors in execution or else to lack of essential resources. Such alterations as have recently been carried out as a result of the teachings of the World War have been in detail and not in principle.

The British plan subordinates the administrative staff to the general staff less than is the common practice. This is perhaps due to the nature of British campaigns of the 1874–1902 era, campaigns fought in regions often destitute of communications and always poor in resources. Almost everything hinged on supply and transport in these contests, and the transport generally had to be improvised on entirely new methods for each particular case. Losses in action were as a rule trifling as compared to losses from disease. For one thought that the commander or his chief advisers gave to the enemy, ten thoughts were given to communications. Instead of looking to the front they were generally looking to the rear. Duties such as are now apportioned to the administrative staff greatly outweighed in importance duties such as are now apportioned to the general staff. There was little difficulty in beating the enemy if only supplies could be got up to permit a fight. But, to whatever cause it may be attributable, the fact remains that the chief of the general staff of a British army nowadays is merely in the position of *primus inter pares* relatively to the adjutant-general and the quartermaster-general—and it is the same at the War Office. In almost all other armies, on the other hand, including that of the United States, the chief of the general staff is definitely chief of the staff. And he also is usually called chief of the staff, the heads of different branches of the administrative staff being absolutely subjected to him. The "chief of the staff" plan was moreover adopted in the case of several British campaigns of modern date, *e.g.* that of 1882 in Egypt and Lord Wolseley's and Lord Kitchener's expeditions up the Nile in 1884–5 and 1898. A chief of the staff was appointed to Sir R. Buller at the outset of the S. African War (although owing to unforeseen events he never took up the post), and at a later date Lord Kitchener went out as chief of the staff to Lord Roberts.

If the existing British staff organization comes to be compared with those where the chief of the general staff is also chief of the staff, it will be found that there is something to be said on both sides. That part of the British system under which a command or a district is in peace-time supplied with a superior officer in charge of administration, to whom wide responsibilities are allowed and who is generally in practice senior to the principal general staff officer, permits the general in command to devote nearly the whole of his attention to preparing his troops for war. But that arrangement would be unworkable in the field. There the progress of operations is so dependent on the work of the administrative staff that the commander cannot transfer his authority in connexion with the latter to somebody else—as is recognized in the British staff organization in time of war by the heads of the adjutant-general and the quartermaster-general staffs, as well as the inspector of communications, then dealing direct with the commander. Still, the fact that a peace arrangement does not fit in with the requirements of war is not a conclusive argument against that arrangement's holding good in peace-time, which after all represents the normal condition of things; and the British plan of a chief of administration is only a special feature in a larger question. Objections do undoubtedly exist in peace-time to the supremacy of the chief of the general staff. That automatically makes him responsible for the work of the administrative staff, and as all manner of administrative problems—unimportant problems, perhaps, but problems which have to be solved—are constantly arising in peace-time, most of the chief of the general staff's time may come to be occupied with matters that are not general staff matters at all, and military policy, manœuvres, training of troops, higher instruction, defence schemes, and so forth, may suffer. But, if peace represents the normal state of affairs, armies none the less exist for purposes of war, and in time of war the case for the British system is not so strong.

In face of the enemy, operations—planning them, deciding whether the plan is feasible, and taking the necessary steps for their execution—are of paramount importance, but cannot be said actually to govern administration, for unless the army's establishments are maintained and unless it has its food, its ammunition, etc., it cannot carry out the operations. The success of the plan may in the main depend on strategical and tactical factors; but in framing the plan the duties which the administrative staff will have to perform in connexion with its execution must have been considered with meticulous care. It is for the administrative staff to say whether the plan is feasible from the point of view of supply, transport, depots, hospital service, and so forth. There may be great administrative difficulties in the way, which will as a matter of course be represented. It is, however, for the general staff to weigh the administrative as against the strategical aspects of the case and then lay the whole subject before the commander for a final decision. The British *Field Service Regulations* clearly admit by implication that the chief of the general staff is the superior of the adjutant-general, the quartermaster-general and the chief of communications, without their being actually under him. That, under conditions such as develop on active service, is apt to prove a somewhat clumsy arrangement and to give rise to friction. It is neither one thing nor the other. Granted that the "chief of the staff" system means centralization, granted that it demands from the chief of the general staff a somewhat closer acquaintance with purely administrative questions than would be necessary if the heads of the chief branches of the administrative staff were virtually his equals, even granted that under it less of his time will be available for the consideration of the strategical and tactical situation than would otherwise be the case, the system does seem a more satisfactory arrangement for purposes of operations in the field than that which found favour in the British army after the setting up of the Army Council. Nor would it seem to follow as a matter of course that the "chief of the staff" system must not be adopted in war-time, simply because it does not obtain during peace. (C. E. C.)

STAMBOLIISKI, ALEXANDER (1879–), Bulgarian statesman, was born at Slavovitsa in Bulgaria Sept. 1 1879. He was of peasant origin, but obtained a good education at Sofia and then at Halle in Germany. In 1902 he became editor of the newspaper of the Agrarian League and later entered the Sobranje. He soon acquired great influence among the peasants, and from the first took up an attitude of fearless opposition to King Ferdinand's policy. In 1908 Stamboliiski headed the Agrarian protest against the Declaration of Independence, as being in the interest of the dynasty rather than of the people. In 1911 he made a violent speech in the Grand Sobranje, opposing the amendment to the constitution by which the King was given the right to make secret treaties, and in 1913 he openly accused the King of having brought about the calamitous war with Serbia. On Sept. 17 1915 Stamboliiski accompanied the other leaders of the Opposition to the palace, and, in a forcible speech and later in personal conversation, he warned the King with characteristic *brusquerie* that if he again plunged the country into war it would end in disaster and that he would lose his throne, if not his head. Stamboliiski was then condemned to imprisonment for life, and was kept in strict and painful confinement from Sept. 30 1915 for three years; he was, however, allowed access to books and spent much of his time in study and writing. On Sept. 25 1918, when imminent catastrophe compelled Bulgaria to seek an armistice, he was released, and, after a stormy interview with the King, went to the front, where a revolutionary movement among the troops was developing. He returned with the insurrectionary troops to Sofia, and order was restored only after much loss of life; Stamboliiski was obliged to go into hiding, even after the King's abdication. The Government, however, soon realized that his help was essential in the critical state of the country, and he became Minister of Public Works in Todorov's Cabinet. Although the Agrarians had not an actual majority after the election of Aug. 1919, Stamboliiski became President of the Council and Minister for Foreign Affairs; on Nov. 27 he had the courage to sign the Treaty of Neuilly on behalf of his country. In April 1920 the Cabinet was reconstructed, Stamboliiski remaining as Premier, Minister for War and of Foreign Affairs in a Cabinet composed entirely of his own followers.

STANFORD, SIR CHARLES VILLIERS (1852–), Irish musical composer (*see* 25.773), published in 1911 *Musical Compositions;* three years later appeared *Pages from an Unwritten Diary* and in 1916 *A History of Music,* written in conjunction with his former pupil, Cecil Forsyth. In later years his music included the operatic piece *The Critic* (op. 144), produced by Beecham in 1916, and *The Travelling Companion* (op. 146), which won a Carnegie award in 1917, but had not yet been produced in 1921. In 1919 his symphony *L'Allegro ed Il Penseroso* also won a Carnegie award, and in 1921 his setting of a poem by Mr. Justice Darling entitled *At the Abbey Gate*—the point being the burial of the Unknown Warrior in the Abbey—was produced by the Royal Choral Society in the Albert Hall. Stanford's *Songs of the Fleet,* originally produced in 1910, gained great popularity, and he also composed much chamber music.

STANMORE, ARTHUR HAMILTON HAMILTON-GORDON, 1ST BARON (1829–1912), British administrator, was born Nov. 26 1829, the youngest son of the 4th Earl of Aberdeen. He was educated at Cambridge and afterwards entered politics, becoming private secretary to the Prime Minister, Lord Derby, from 1852 to 1855, and sitting as member for Beverley from 1854 to 1857. He was successively governor of Trinidad (1866–70), Mauritius (1871–4), Fiji (1875–80), New Zealand (1880–2) and Ceylon (1883–90). He was raised to the peerage in 1895, and died in London Jan. 30 1912. He was succeeded by his son, George Arthur Maurice Hamilton-Gordon, born Jan. 3 1871, who in 1916 was appointed lord-in-waiting to King George V.

STEAD, WILLIAM THOMAS (1849–1912), English journalist (*see* 25.817), was drowned on the "Titanic" April 15 1912.

STEED, HENRY WICKHAM (1871–), English journalist, was born at Long Melford, Suffolk, Oct. 10 1871, the son of a local solicitor, and was educated at Sudbury grammar school and the universities of Jena, Berlin and Paris. From 1896 to 1913 he acted continuously as foreign correspondent to *The Times*, beginning in Berlin, passing on to Rome, where he remained five years (1897–1902), and thence to Vienna (1902–13). His *Hapsburg Monarchy* (1913; 4th ed. 1918) is recognized as the most illuminating work that has been written on Austria-Hungary. In 1914 he became foreign editor (in London) of *The Times*, and in Feb. 1919 was appointed to succeed Mr. Geoffrey Dawson as editor. During the World War he was a prominent supporter of the Yugoslav movement. In 1918 under Lord Northcliffe he was engaged on propagandist work in the enemy countries, and he headed a special mission to Italy in March and April of that year. His other publications include *The Socialist and Labour Movement in England, Germany & France* (1894); *L'Angleterre et la Guerre* (1915); *L'Effort Anglais* (1916); *La Democratie Britannique* (1918).

STEER, P. WILSON (1860–), English painter (*see* 25.868), exhibited after 1886 practically the whole of his work at the New English Art Club, in whose formation he took a leading part and of which he was at one time president. His earlier work, such as the "Boulogne Sands" showed the influence of impressionism in its feeling for light and its handling of colour; but after 1895 he adopted a more sober palette, at times using strong black shadows with silvery lights, and gave increased attention to design. After 1900 he returned to the use of a full range of pigment, and produced some of his finest work, such as "Richmond after Storm" (1903) and "The Isle of Purbeck" (1909). In later years he only used the impressionist colour analysis to a very limited extent, and generally worked within a chosen and limited colour scheme. His feeling for colour harmony and power of rendering subtle variations in tone relate him to Gainsborough (a likeness well exemplified in "The Beaver Hat"), and give his work its characteristic quality. Most typical perhaps are his landscapes, mainly wide stretches of country with broken skies, full of light, atmosphere and a sense of space; but he also produced many portraits and figure compositions, his paintings of the nude being marked by great appreciation of the character and quality of flesh. His later work includes "A Summer Evening" (1914), "Painswick Beacon" (1916), "The Vale of Gloucester" (1917), "Chirk Castle" (1917), and a considerable group of water-colours, very delicately and directly handled. A self portrait is in the Uffizi Gallery, Florence, and he is represented in the Tate Gallery, the Municipal Gallery, Dublin, and the Johannesburg Gallery.

STEFÁNSSON, VILHJÁLMUR (1879–), Canadian explorer, was born at Arnes, Manitoba, Nov. 3 1879, of Icelandic parentage. He was educated at the universities of North Dakota and Iowa, and afterwards at Harvard. He became a newspaper reporter, but later was appointed to an instructorship of anthropology at Harvard, and became deeply interested in the problems of the Arctic regions. He made a private expedition to Iceland in 1904, and the following year returned with a Harvard archaeological expedition. He visited the Eskimo of northern Alaska (1906–7), and in 1908 started on a four years' expedition to the Arctic shores of Canada under the auspices of the Geological Survey of Canada and the American Museum of Natural History, with interesting results. In 1913 Stefánsson was appointed commander of the Canadian Arctic expedition which sailed from Victoria, B.C., in June of that year to explore the northern shores of Canada and Alaska. In 1914, with two companions, he crossed Beaufort Sea on the moving ice from Martin Point, Alaska, to the north-western corner of Banks I.; in 1915 he visited the sea west of Prince Patrick I. and discovered more land to the north; and in 1916 discovered land west of Axel Heiberg Island. The following year he travelled, again over moving ice, as far as lat. 80° 30′ N. and long. 112° W. The expedition returned to Canada in 1918 (*see* ARCTIC REGIONS). Stefánsson published *My Life with the Eskimo* (1913), *The Friendly Arctic* (1921) and an anthropological report on the expedition of 1908–12, besides many articles in scientific journals. He received many honours from learned societies.

STEIN, SIR (MARK) AUREL (1862–), British archaeologist, was born at Budapest Nov. 26 1862. Educated in the public schools of Budapest and Dresden and afterwards at the universities of Vienna and Tübingen, where he studied Oriental languages and antiquities, he went to England for further study and then to India, where he became principal of the Oriental College, Lahore, and registrar of the Punjab University in 1888. Eleven years later he was appointed to the Indian Education Service, and for the next two years carried out archaeological explorations for the Indian Government in Chinese Turkestan. In 1906–8 he made further explorations (*see* 27.425) in central Asia and western China, receiving the gold medal of the Royal Geographical Society. From 1909 he was superintendent of the Indian Archaeological Survey, and in 1913–6 carried out explorations in Persia and central Asia, described by him in the *Geographical Journal* (1916). He was created K.C.I.E. in 1912. His other publications include *Chronicle of Kings of Kashmir* (1900); *Ancient Khotan* (1907) and *Ruins of Desert Cathay* (1912).

STEVENSON, ADLAI EWING (1835–1914), American political leader (*see* 25.907), died at Chicago June 13 1914.

STEWART, JULIUS L. (1855–1919), American painter (*see* 25.914), died in Paris Jan. 4 1919.

STEYN, MARTINUS THEUNIS (1857–1916), Dutch S. African politician (*see* 25.915). After the prominent share which he took in the work of the S. African National Convention in 1909–10 ex-President Steyn retired into private life at his farm, Onze Rust (Our Rest), near Bloemfontein. From this retirement he never emerged till his death Nov. 28 1916, except to address occasional meetings of the Dutch people of S. Africa on topics of national interest. Yet this almost complete retirement from public activities did nothing to lessen his influence with his own people. It cannot be said that this influence was exercised to promote racial peace in S. Africa. When the dissension between Gen. Botha, the first Prime Minister of the Union of S. Africa, and Gen. Hertzog began to shake the frame of the Ministry, ex-President Steyn might have had a decisive influence in composing that difference, which was ultimately to break Gen. Botha's Cabinet and to lead to long dissension among the Dutch-speaking people of S. Africa. His weight, however, was thrown without reserve on the Hertzog side. The ideas of ex-President Steyn were the ideas of Kruger. He held with tenacity the creed of the Boer who regarded himself as the holder of S. Africa by a species of divine right, who resented the intrusion of the British element, and was determined to treat that element as intruders and "foreign adventurers." Beyond doubt they were sincere, if narrow. He held, as Kruger had held, and as Gen. Hertzog held, that the intrusion of the British element involved a descent into the muddy waters of commercialism, the strife of contending ideas and embroilment in the tangles of world-politics.

STINNES, HUGO (1870–), German industrialist and financier, was born at Mülheim on Feb. 12 1870. He was the son of Hugo Stinnes, and grandson of Matthias Stinnes, who was the founder of a firm in no great way of business at Mülheim in the Ruhr district. After passing his leaving examination from a *Realschule*, young Stinnes was placed in an office at Coblentz where he speedily picked up the elements of a business training. In order to get a practical knowledge of mining he worked for a few months as a miner at the Wiethe colliery. He then, in 1889, attended a course of instruction at the Academy of Mining in Berlin. In the following year he entered the firm which his grandfather had founded. He remained there only two years and then established a firm of his own, Hugo Stinnes, Ltd. The whole original share capital was 50,000 marks (pre-war=£2,500). Gradually, from dealing in coal, he became himself the owner of several mines and extended his business to the manufacture of different kinds of fuel such as briquettes. He also began to purchase sea-going vessels as well as river steamers and barges, the latter, especially on the Rhine, on a constantly increasing scale. He next organized an extensive international business in coal, and had 13 steamers trading to and from North Sea, Baltic, Mediterranean and Black Sea ports. They carried coal, wood and grain, also iron-ore, Stinnes having begun to manufacture iron and steel. He also imported great quantities of English coal and had an agency at Newcastle as well as an interest in some English mines. This led to his establishing branches of his business at Hamburg and at Rotterdam. Before the World War he was the possessor of a fortune which was vaguely estimated at several millions of pounds. He was a director of many of the greatest industrial and mining companies of Westphalia, the Rhineland and Luxemburg. Business interests of this magnitude were constantly expanding, and he became interested in numerous subsidiary enterprises, such as tramways and the supply of electric power and light. He was always engaged in founding new concerns or amalgamating existing ones. Stinnes managed to maintain an extensive and even a detailed knowledge of the working of all the concerns in which he was engaged, and in all of them to exact zealous and conscientious work from his business subordinates. The secret of his success was essential unity of direction and coordination of aims in all branches of his enterprises.

When the World War broke out he secured an enormous share in the war profits which flowed into the coffers of the great industrialists. In enemy countries, it is true, his enterprises were sequestrated, and his firm at Rotterdam placed on the Allies' "black list." But he was richly compensated, apart from the regular indemnification paid by the German Government, when he was called in by Ludendorff as the most competent expert to give advice, to organize the coal and the industrial production of occupied Belgium and to help to set in motion the gigantic production of war material which the German G.H.Q. demanded from the homeland. His connexion with Ludendorff led to his becoming an influence behind the scenes in German politics, and, after the revolution, to his entering the Reichstag, as well as to his début as a newspaper proprietor on a grand scale. During the war he had extended his activities in Hamburg and had bought up in 1916 the Woermann and the E. African lines. In these fresh undertakings he became associated with the two greatest German shipping concerns, the Hamburg-American line and the North German Lloyd. His Hamburg interests continued from that date onwards to multiply in something like geometrical progression. Half a dozen landed estates were purchased in Saxony to supply timber for pit props. At Flensburg in Schleswig he secured control of the largest Baltic shipping concern, and proceeded to build a new fleet of ships, christening one of them the "Hindenburg." In the elections of June 1920 he secured a seat in the Reichstag as a member of the Deutsche Volkspartei, the new electioneering name of the former National Liberal party. He had about the same time begun to buy up leading German newspapers, one of his main objects being to organize a solid and powerful *bloc* of opinion in Germany in support of law and order and the promotion of the highest industrial and commercial efficiency. His newspaper purchases included the *Deutsche Allgemeine Zeitung* in Berlin, formerly the organ of Bismarck and then of all succeeding German Governments, the *Münchener Neueste Nachrichten* and the *München-Augsburger Zeitung*, the last-named being one of the oldest newspapers in Germany. Both of the South German journals were previously exponents of a very much more democratic trend of opinion than that which came to characterize them under the new proprietorship. Ancillary to these acquisitions large interests were secured by Stinnes in paper-works in order to make his newspapers independent of the paper market.

In the autumn of 1921 he was reported to be contemplating some still vaster venture in the nature of a super trust to control every industry in Germany, so that the whole might ultimately be coördinated like one gigantic concern regulating production, transport and the supply of the German markets and those of the whole world. It might thus be possible to avoid waste, sudden crises, ruinous competition and foreign commercial dictation. He was reported to have already expended the equivalent of about £250,000,000 on these aims and to be continuing to sink further millions in them. The Social Democrats were believed not to be averse from Stinnes' vaster scheme, as it corresponded in certain aspects with their own plans, when they were in power, for coördinating all German industries, pending the possibility of socializing them. An instrument for superintending this coördination in the social and economic aspects was ready to hand in the Economic Council of the German Reich, set up by the new Republican constitution of 1919.

The only public check which Stinnes was known to have received in the course of his career was at the Spa Conference in 1920, when he attempted to address that assembly in peremptory language concerning the impossibility of the coal deliveries demanded by the Allies and was summarily silenced by the president.

STOCK EXCHANGE (*see* 25.930).—Before the outbreak of the World War in Aug. 1914 the London Stock Exchange had for several years experienced two remarkable periods of activity, both being the outcome of industrial development which caused a rapid intensifying of the demand for two commodities—namely, oil and rubber. This was the sequel to the discovery of the internal-combustion engine, and its increasing adoption in mechanical road transport.

Pre-war Rubber and Oil Booms.—The rubber boom came first. It began in 1909, and lasted until about 1912. The demand for rubber applied a great stimulus to the rubber plantation industry in the Malay States, the Dutch East Indies, Ceylon and India. The price of rubber rose at one time to over 12s. per lb., and an enormous number of new companies were formed, mostly with capitals of moderate size. In order to popularize rubber as an investment the resourceful company promoter introduced shares of the denomination of 2s. each. The innovation was extraordinarily successful, and a very large number of companies were floated with capital divided into 2s. shares, while others formed prior to the boom sub-divided their shares into the smaller and more popular denomination. Prices of shares rose to extraordinary heights. Premiums of thousands per cent were common, the shares of the Patalung and Selangor companies, two of the earliest plantation companies, rising to premiums in excess of 3,000 per cent. In Stock Exchange parlance the public "got the bit between its teeth," and the boom persisted for a long time. Large fortunes were made by people who participated in the boom in the early period. A reaction in the price of rubber, which ultimately fell below 1s. per lb. in 1921, had already put an end to the boom before the war began. Although the extravagant prices paid during the boom were at no time justified, the companies paid very satisfactory dividends for years; and it was not until the post-war depression, which was unparalleled in its severity, swept over the commodity markets in the latter part of 1920 and the first part of 1921 that the industry was faced with real difficulties. The tremendous stimulus applied to planting in 1910, 1911 and 1912 led to the inevitable overproduction, and in 1919 and 1921 schemes for limiting output were put into force.

The oil boom began shortly after the activity in rubber had been well spread. It persisted for a longer period, for the reason that the price of oil rose steadily from the introduction of the motor-car. It eventually reached its maximum height in 1920, but a reaction began in 1921, and this produced a corresponding movement in the share market. There was an enormous demand for petroleum spirit in the war period, and the price rose steeply. After the cessation of hostilities the price rose further, a circumstance which was partly due to the conversion of locomotives and ships' engines from coal to oil, partly to the great extension of mechanical transport on the road and in the air, and partly to the fact that the refinement and distribution of oil was in the hands chiefly of two vast organizations. The boom was accompanied by the flotation of a number of companies, particularly in Russia, where the Maikop field for a time attracted much attention. But in comparison with rubber, oil did not provide the same opportunities for the company promoter, and the flotation of companies for the exploitation of oil-fields, known and unknown, was comparatively limited. The oil boom lasted approximately 10 years, when a reaction set in. But meanwhile huge fortunes were made. Bonus shares were issued in great numbers by the principal oil companies, and this, together with high dividends, kept public interest at a high level.

With the exception of the oil market, stock markets were in a depressed condition for some time before the outbreak of war.

The War Period.—Early in July 1914, rumours of war began to affect the Continental *bourses*. On July 13 the Vienna market was demoralized by fear of hostilities, but it was not until July 24, when the terms of the Austrian ultimatum to Serbia were made known, that the London market became seriously perturbed. From that date until Friday July 31, when the London Stock Exchange Committee for General Purposes decided to close the House for an indefinite period, markets were inundated with a vast flood of selling orders from home and abroad, and excitement was intense. The European *bourses* virtually ceased to function, and this diverted an enormous stream of foreign selling orders to London. Inter-*bourse* securities naturally suffered a very heavy decline. On Monday July 27 many London jobbers ceased to "make prices." This was "general carry over" day, and the difficulties to be met by speculators were formidable. The settlement, however, was completed on Wednesday July 29, without any very serious disaster, though 9 failures, involving 20 members, were announced. Dealing, however, had become a matter of negotiation entirely, and on Thursday July 30 1914 the House opened for the last time that year. During the first two hours no attempt was made to do business, and the next morning the committee decided not to reopen the House until further notice. On Monday July 27 four consecutive transactions in consols were officially recorded at prices showing a movement of £1 between each bargain, a circumstance without precedent in modern London Stock Exchange history. During the closed period, business, despite official discouragement, was not entirely suspended. A certain amount of dealing, on a strictly cash basis, was found to be possible. On Sept. 14 the committee fixed minimum prices for trustee stocks, based on the quotations ruling on July 30, the object being to prevent disastrous depreciation. The New York Stock Exchange similarly made minimum prices for American shares, and these values were adopted by the London committee. The maintenance of these prices was insisted upon by the banks, which had undertaken to continue their loans against securities without asking for any additional margin.

Meanwhile the question of dealing with the uncompleted mid-August account was taken in hand on the London Stock Exchange and completed on Nov. 19, a special set of rules governing its arrangement. The gist of these rules was that bulls of stock carried over on July 27 should put up a 5% margin on high-class securities, and 10% on others, and pay interest fortnightly, or alternatively pay a higher rate of interest in lieu of margin. The "taker in" was put under the obligation of continuing to "take in" stock at July 27 prices until 12 months after the war, or the expiring of the Courts (Emergency Powers) Act, 1914, whichever event was the sooner. The declaration of a moratorium, which was continued until Nov. 4 1914, made it impossible to reopen the Stock Exchange for some months. About £90,000,000 had been borrowed against securities before the war began, and it was not until the moratorium came to an end that the mid-August settlement was carried through. The affairs of a small number of members were in this operation wound up under the liquidation rule, but the amount of stock carried over under the temporary regulations was smaller than had been feared. As stocks rose to the mean price of July 27 they had to be taken up or sold. On Dec. 23 1914 the conditions governing the reopening of the London Stock Exchange were promulgated. The minimum price list was then extended to include inter-*bourse* securities. Minimum prices were gradually abolished as liquidation ceased and prices settled down to the new level of investment values. On July 3 1916 the last of the minimum prices were removed.

The London Stock Exchange was reopened for the first time after the outbreak of war on Jan. 4 1915. Severe restrictions were placed upon the transaction of business, in accordance with arrangements made in Dec. 1914, between the Committee for General Purposes and the Treasury. These arrangements were embodied in Temporary Regulations which were substituted for the old regulations governing Stock Exchange practice. All bargains had to be done on a cash basis. The suspension of virtually all speculative business was the most important innovation introduced by the Temporary Regulations. Normally, speculation forms the great bulk of business effected on the Stock Exchange, and its temporary abolition deprived many members of their occupation. The volume of business which it was possible to do was further restricted by two other features of the Regulations—namely, the "physical possession" rule, which prohibited dealings in stock that had not been in physical possession in the United Kingdom since Sept. 1914, and the fixing of minimum prices for trustee and other securities, which were in nearly every case the mean prices on July 27. Both of these rules were relaxed to some extent during 1915; the former to facilitate sales of American securities held in Allied and neutral states, and to allow sales of colonially held stock. When they were established, minimum prices undoubtedly served a very valuable purpose, but when the issue of high-yielding war loans completely altered the standard of investment, as regards the yield in interest, no useful purpose was served by them. The retention of minimum prices fixed on a pre-war basis of credit made it impossible to deal in the securities affected, and that was the reason for their removal. But the absence of speculation naturally caused a considerable reduction in membership. On the day of reopening the number of transactions was less than 1,000. On subsequent occasions the number rose to well over 3,000 per day, but in 1915 the daily average was nearer 2,000 than 3,000. A heavy loss of revenue was sustained by the company owning the Stock Exchange, and in 1915 it failed to distribute an interim dividend.

The arrangement by which all stocks carried over at the outbreak of war were continued until after the end of the war, unless the "end of July 1914" prices were reached, worked well in practice, thanks largely to the American demand for securities; and the "open" position on the London Stock Exchange, which in Aug. 1914 was about 90 millions sterling, had been reduced by the end of 1915 to about 20 millions.

With the reopening of the London Stock Exchange an important reform was introduced which was continued after the cessation of hostilities. The Temporary Regulations provided that every bargain should be recorded. This practice was much preferred by the public to the pre-war custom of marking only occasional bargains. The absence of buying and selling prices, dealers being prohibited from offering stock in the market, was one of the reasons for the compulsory marking of all bargains. This reform led to the issue of a supplementary list of bargains in securities not quoted in the daily "official" list. Thus, from Jan. 4 1915 onwards, a complete record of business done was furnished by the two lists, on the authority of the committee. Another innovation was the retention in the lists of prices of previous bargains, which added to their value to the public.

The course of prices in 1915 and subsequent war years was generally downward. In June-July 1915 the flotation of the unlimited 4½% British Government War Loan made a lowering of investment values inevitable. This for a time checked business in the stocks protected by minima, and caused a heavy fall in other fixed interest-bearing securities. In March 1915 minimum prices were reduced to a small extent. The minimum for Consols was reduced from 68½ to 66½ prior to the issue of the 4½% War Loan, and it was removed later when the great bulk of the stock had been converted into the 4½% stock. The market for American securities was very active and strong throughout 1915, and prices showed a substantial advance on the year. The war-time prosperity in the United States caused a great demand for American securities held in the United Kingdom and France. European holders were encouraged to sell by the appreciation of the dollar in terms of sterling, which enabled a profit on exchange to be made. In the second half of the year the British Government bought large quantities of American securities held in the United Kingdom and sold them in the United States in order to provide itself with means of making payment for munitions, etc. (*see* DOLLAR SECURITIES MOBILIZATION). It is estimated that in this year about 150 millions sterling of American securities were transferred to the United States. Towards the end of 1915 the Government ceased operations in the market, and invited holders either to sell or loan approved securities to it. Thus came into force what was subsequently known as the Dollar Securities Mobilization Scheme. The terms of purchase were approximately the parity of the New York price, and for loan a bonus of ½% per annum in addition to the interest or dividend on the loaned security, plus a premium of 2½% in the event of the Government exercising its right to sell the stock loaned to it. The Temporary Regulations were made more stringent as the war continued, but 1917 witnessed a check to the depreciation of fixed interest-bearing securities for the first time since the S. African War of 1899–1902, and also a sustained upward movement in industrial securities.

The following table, compiled from figures published by the *Bankers' Magazine*, shows the course at different important dates of investment values since the calculations were first made. The values relate to 387 representative securities:—

Jan. 1907	£3,843,000,000
*July 20 1914	£3,371,000,000
†Nov. 1918	£2,822,000,000
Dec. 1919	£2,634,784,000
Dec. 1920	£2,319,777,000

*Pre-war. †Month of Armistice.

The general depreciation was due not only to the exceptionally heavy demand for money to carry on the war, but also to the growing burden of direct taxation in the United Kingdom. For a time the British investor showed a marked preference for industrial securities, on which high dividends were paid together with, in many cases, bonuses either in the form of cash or scrip. Bonus shares were created and issued by a large number of concerns. The scarcity of capital caused a steady rise in the rate of interest, and first-class companies found it necessary to pay 8% and even more on new debentures and preference capital. The Treasury scheme for buying and borrowing dollar securities in 1916 was followed in 1917 by a scheme for requisitioning those which had been neither lent nor sold. This put the finishing touch to the process which had begun in 1915, of extinguishing the American market in London.

Throughout the war period the London Stock Exchange Co. had a very lean revenue. Receipts, which in 1914–5 amounted to £296,757, dwindled to £130,304 in 1917–8; and the dividend dropped to £1 per share.

A feature of the year 1918 was the advance in foreign Government securities, especially those of neutral nations. Bonds of the neutral countries were bought for exchange purposes, and they changed hands up to extraordinarily high figures in the first half of the year. Spanish 4's touched 135 at one time, owing to the rise in the sterling value of the peseta, and Swedish 3½% stock rose to 115, through appreciation in kroner.

Calculations made by the *Bankers' Magazine* show that the values of 387 representative securities fell during 1919 from £2,801,089,000 to £2,634,784,000, a decrease of £166,605,000, equal to 5·9 per cent. (As on July 20 1914, the total was £3,371,000,000, the decline in the five and a half years to Dec. 1919 was no less than £736,216,000, or nearly 22 per cent.) At one time during the war the values touched £2,572,000,000. This was on April 20 1918—at the height of the Germans' last great offensive effort. It is interesting to note that in Jan. 1907, when the valuations began, the total was £3,843,000,000. The valuation at the end of 1919 showed a net shrinkage of £1,208,000,000, or 31½%, of which £736,216,000 was due to conditions brought about by the war. The war-time depreciation in fixed interest-bearing securities was greater than this. Taking the values of 108 fixed interest-bearing securities we find that the total on July 20 1914 was £1,989,000,000, at the close of 1918 £1,575,000,000, and at the end of 1919 £1,378,906,000. On the other hand, the value of 279 speculative investments, *i.e.* the dividends on which fluctuate according to profits, was £1,382,000,000 on July 20 1914, at the close of 1918 £1,226,000,000, and at the end of 1919 £1,255,578,000. Thus there was a net depreciation in fixed interest-bearing securities of £610,094,000, or 30%, in the whole war period, of which £196,094,000 occurred in 1919; while speculative investments showed an increase of £29,578,000 in value during 1919, or 2.4%, but a net depreciation of £126,422,000 on the whole period, or 9 per cent.

After the War.—In spite of marked activity in speculative investments, the year 1919 witnessed a generally downward tendency in prices of securities, with the result that a large part of the appreciation which took place in the closing months of 1918, following the collapse of Germany's war effort, was lost. The reaction was due in a large measure to heavy Government expenditure, bringing with it the pressure of high taxation, and an adverse American exchange, the former involving a continuance of heavy borrowing, and the latter a rise in the Bank of England rate from 5 to 6% at the beginning of Nov. 1919. The failure of the British Government's Funding Loan operation in the summer had an adverse effect on the market for gilt-edged investments, and the City of London received something like a shock on learning that national expenditure in the second half of the year was scarcely distinguishable in amount from that of a large part of the war period. Markets, however, presented a generally animated appearance. This was in part due to the return of warrior members. Attention was mainly concentrated on speculative securities, notably oil, brewery, insurance, shipping, S. African gold, and commercial and industrial securities. Fixed interest-bearing securities were persistently neglected, owing to the higher value of money and the competition of numerous new issues offering yields as high as 9 per cent. In the summer of 1919, various war-time restrictions were removed from the London Stock Exchange with the approval of the Treasury. The removal of the embargo on exports of capital enabled foreign-held stocks to be realized in the London market; but arbitrage transactions continued to be prohibited. Some of the declarations which had to accompany each transaction were abolished, but the temporary regulation prohibiting any but cash transactions was retained.

Gold-mining shares made a substantial advance in the closing months of 1919 owing to the high premium received on gold under an arrangement come to in July for restoring free conditions to the market for gold newly produced. This enabled the companies to declare larger dividends in Dec., and rescued a large number of low-grade mines from imminent bankruptcy. Towards the close of 1919 Rand Mines shares were introduced on the New York market, this being the first time that S. African gold shares were listed in Wall Street. The diamond companies enjoyed a wonderful prosperity during the year, the De Beers Co.'s revenue amounting to as much as one whole day's war expenditure at the maximum level. Record dividends were paid, and share quotations reached unprecedented figures.

The year 1920 was the most remarkable of the early post-war period. At the beginning markets in London were extraordinarily active, owing to the boom in trade. The oil market was in a state of ceaseless activity, and other speculative markets felt some of the reflected glory of inflated oil profits. Nomination for membership of the London Stock Exchange rose in price to £650, but was almost unsaleable at the end of the year. There was a great congestion of work in brokers' offices in the early months, and they were kept open until late at night for several weeks. But the introduction of a British budget of 1,200 millions, with its unpleasant reminder of the burden of taxation, administered a check to the reckless buoyancy of markets. The collapse of the exchanges of all the countries except the United States

Sweden, Switzerland and Holland, caused a steady stream of liquidation in London from the Continent, which grew in volume when, later in the year, a heavy fall occurred in wholesale commodity prices. The fall in commodities forced traders to realize securities. The pressure to obtain money to finance production and distribution and pay taxes caused persistent liquidation in the gilt-edged market, and British Government securities fell to a level giving a return of well over 6% per annum. In Dec. 1920 the leading stocks, in some cases, touched the lowest points on record. The 5% War Loan fell to $81\frac{5}{16}$, Victory Bonds to $70\frac{1}{2}$, Funding Loan to $65\frac{3}{16}$, and Consols to $43\frac{5}{8}$. The *Bankers' Magazine* calculations of the prices of 381 representative securities in Dec. 1920 showed a fall in values of no less than £315,000,000, the largest loss ever recorded in one year. British and Indian funds fell in value in 1920 by 11·9%, foreign Government stocks by 18·8%, home railway stocks by 17·3%, foreign Government stocks by 23·5 per cent. The decline in commercial and industrial securities was much greater, the percentage being 40·9. The severity of this reaction was, of course, due to the sudden collapse of the six-year-old boom in trade. Iron and steel shares suffered a depreciation of 33·7%, shipping securities of 21·7%, and S. African mining shares of 39·2 per cent. The losses of the investor were so severe that he lost all interest in speculative stocks and turned his attention to gilt-edged stocks. This brought about a steady recovery in the latter in the first half of 1921. The issue of foreign Government loans in London, which was suspended on the outbreak of war, was renewed in 1921, when a loan to the São Paulo Government was issued, followed by an issue of Norwegian Government bonds.

American and Foreign Stock Exchanges.—The shock of the World War caused stock markets all over the world to shiver and collapse more or less. By custom London was a market to which every *bourse* abroad turned for help when there was any pressure, and for a period of at least a fortnight after the middle of July 1914 the London market was called upon to absorb a flood of selling orders from every mart in Europe where securities were dealt in. While the European *bourses* had to all intents and purposes suspended business by the beginning of the week ended Aug. 1, there was a fairly free market for securities in London in the great majority of international securities down to the middle of the week. The news of the coming war affected the European *bourses* early in July. On the 13th of that month the Vienna market was described as having become quite demoralized by the fear of war. The Berlin *bourse* reflected this nervousness because Germany was Austro-Hungary's chief lender, Government and municipal loans of the Habsburg Empire being held in Germany to the extent, it was estimated, of over £200,000,000. On Monday July 27, the day before the declaration of war by Austria, the panic in Vienna was such that the *bourse* was ordered to be closed for three days. Subsequent events showed it was destined to be closed for an indefinite period. The Brussels market followed the lead of Vienna, ceasing business on July 27, and the Paris *coulisse*, or outside unofficial market, also suspended operations on that day. On Tuesday July 28, before the declaration of war by Austria had become known, dealings became very difficult. On July 29 all account dealings in Berlin were suspended, transactions being confined to cash bargains. The Amsterdam and St. Petersburg *bourses* were entirely closed that day, while on Thursday all markets suspended business except London, Berlin, Paris and New York, but the settlement in Paris fixed for July 31 was postponed. Business on the Berlin *bourse* was ordered to be suspended on the following day (July 31), though the *bourse* was kept open. The Paris market remained open throughout that day, July 31, but only six quotations were available out of some sixty stocks and shares usually quoted in reports from that centre. The Paris *bourse* was the only stock-market to keep open its doors after Thursday July 30. But this *bourse* is under the direct control of the Government, and the authority of the Goverment was no doubt responsible for the *bourse* being kept open. Down to Sept. 2 a few quotations were forthcoming from Paris, but on that day the *bourse* was shut until further notice owing to the approach of the Germans to the French capital. The New York Stock Exchange was open on Tuesday July 28, when the news of the declaration of war by Austria first became known, and it was called upon to withstand the first shock of that announcement. By the end of the day's session it was found that transactions for the first time that year (1914) had exceeded one million shares. On Tuesday July 28 the Toronto Stock Exchange was closed, after being open for 10 minutes, and business on the Montreal market ceased in the afternoon. On July 30 violent breaks in prices occurred on the New York Exchange, but there was at all times a market. The next day, however, the committee decided to follow the lead of London and to close the Exchange.

New York.—In the latter part of 1912 there was a serious decline in American securities, owing to selling from Europe brought about by the Balkan War, but as soon as this unloading ceased the market was much unsettled by the decision of the Supreme Court of the United States ordering the dissolution of the Union Pacific–Southern Pacific merger. Down to the beginning of the World War New York had shown a tendency to develop more and more as a market for international securities, though very little was actually done to encourage foreign securities to seek a market there. In the short and frantic period in the last few days of July 1914 bankers saw ordinary standards of value scattered to the winds and loans aggregating $2,000,000,000 imperilled almost in a night. When the House was closed special committees were set up to undertake the stupendous task of straightening out the apparently hopeless tangle of contracts outstanding when operations were suspended.

The New York Stock Exchange tentatively opened its doors again on Nov. 28 1914, for trading in bonds only. As the experience was encouraging, the committee decided to reopen the House for regular trading on Dec. 13. Minimum prices had been fixed by the committee on Oct. 13, and trading in unlisted securities was resumed on the following day. The minimum prices were revised from time to time and abolished on March 31 1915, owing to a rise in quotations having rendered minima no longer necessary. Then began the most remarkable era in the history of the Exchange. In point of feverish activity and wild fluctuations in prices, the year 1915 was then without precedent. Million-share days, sensational advances, and equally sensational declines, were common occurrences. Price movements were very erratic. The most conspicuous feature of the enormous volume of trading was the participation by the outside public seldom if ever before witnessed on the New York Exchange. Under clique and pool manipulation, prices were whirled upward with startling rapidity. Stocks which led the advances were those of companies which, it was supposed, would benefit most largely from war orders. Throughout the year there was heavy buying of both stocks and bonds by investors and financial interests of the first rank. Many securities reacted from their highest levels before the close of the year, but others, on good business prospects, retained the greater part of their phenomenal rise. Even more remarkable was 1916. Activity was intense, and prices rose to exceptionally high figures. Every dollar security offered from Europe was eagerly snapped up.

The following year witnessed a reaction. The depreciation in the market value of American railway securities was estimated at $3,000,000,000—about one billion in bonds and two billions in shares. The principal causes of this great shrinkage in the market value of railway securities, in which about one-twelfth of the wealth of the United States was invested, were reported to be as follows:—

(1) Enormous destruction of capital in the war, with unprecedented Government loans at rising rates of interest.

(2) The liquidation by Europe of about $1,700,000,000 of American railroad securities in payment for munitions of war.

(3) A rapid advance in the cost of railroad materials and labour, with no compensating advance in railroad rates, and fear on the part of investors that the Government would not promptly raise rates to maintain railroad property and credit.

When the U.S. Government declared war, the composure and strength of the Stock Exchange was an impressively favourable omen. This composure did not continue throughout the year. Prices of outstanding bonds declined steadily; and in Sept. and Oct. an extremely violent movement of liquidation swept over the Stock Exchange, carrying prices of the best investment stocks down to a level lower than that of the panic of 1907. This extreme demoralization of the Stock Exchange did not result from money tension—lending rates were comparatively low throughout the year—nor was it primarily a consequence of decreased earnings or of a weakened economic position on the part of the investing public. It was due to war taxation legislation, and the drawing up of estimates as to how much would have to be raised by taxes and by loans. In 1918 there was a recovery, with prices generally higher on the whole.

In 1919 there was a boom in stock markets which will rank in American finance as one of its greatest historical episodes. The pegging of sterling exchange at $4.76⅞ was removed on March 20 1919, and the other Allied exchanges were released a few days later. But the depreciation of European currencies which followed did not stop European purchases. These increased in volume, and the demand acted as a powerful stimulant on the stock market. There began a speculation in stocks of an unprecedented description. Thousands of industrial corporations were endowed by the war with enormous reserves of cash which war taxation had barely skimmed. The atmosphere of Wall Street was charged with the wildest rumours of "melon splitting," increased dividends, and Liberty Bond distributions. Prices advanced by 10 and 12 points in a day, and on some days 20- and 30-point rises were not uncommon. Amidst this furious activity the million-share day ceased to be exceptional. In May the Stock Exchange was obliged to close on Saturdays in order to give the staffs an opportunity of overtaking arrears of work. When, in the latter part of June 1919, the first reaction occurred, there had been 46 consecutive million-share days. The rise in the value of money was said to be the chief factor which brought the boom to an end. By the middle of Oct. the Federal Reserve Bank of New York found its proportion of reserve to liabilities reduced below the minimum prescribed by law. Call money rose to 30% in Nov., the highest figure since 1907. A coal strike, the heavy fall in the exchanges, and the failure of the Senate to ratify the Peace Treaty, were depressing factors.

Stocks reached the peak of the rise in Nov. 1919. On that occasion the figure was only fractionally below the high-water mark of the war period, viz. 101·51, which marked the culmination of what was described in the picturesque language of Wall Street as the "war-brides" boom of 1916. Then followed the bursting of the distended balloon. In about three weeks the average price of 50 stocks dropped more than 15 points to 85. The collapse remained in the minds of members for a long time afterwards. Despite occasional rallies, prices dropped steadily, and it was manifest that the World War boom was definitely over. November 1920 was also a month of devastating declines, which produced conditions resembling a panic. The index figure of the 50 stocks fell to 68·85, against 94·07 in April.

In the first 11 months of 1920 transactions in stocks on the New York Stock Exchange showed a considerable reduction in volume from those of the corresponding period in 1919—210,220,428 shares, against 296,822,497. The par value of the shares dealt in was $17,983,885,575, or about nine billions of dollars less than the year before. Bond transactions, on the other hand, were much larger, increasing from $2,473,588,050 to $2,495,821,750 for Government bonds, from $258,442,500 to $319,567,400 for state and municipals, and from $522,315,000 to $693,527,000 for those of private corporations.

Arbitrage dealings were restored between New York and London at the beginning of Dec., but there was little business of this character. The depreciated paper pound killed the market for American securities in London. Throughout 1920 a growing interest in foreign securities was shown by American investors, and a comparatively large number of foreign Government and municipal obligations were sold in the American security markets. Competition of domestic issues, however, was fierce, and no little difficulty was experienced in inducing the American public to take up foreign bonds. This had a serious restricting influence on America's export trade, and owing to the inability of Europe to pay for her purchases by exports she had to depend largely on credit given by the United States. In 1921 the depression in trade became very marked, but later a recovery set in.

Paris.—Down to 1911 Paris had been a powerful and persistent supporter of the world's money markets, because of the saving habits of the French people, but in the three years prior to the outbreak of war a change had developed. This was particularly noticeable after the Balkan War of 1912 had disturbed the European *bourses.* France had begun early in 1914 to bring money home to meet her own needs. Excessive issues of short-term notes, the disturbances in Mexico, and the collapse of the St. Louis & San Francisco railway in 1913, caused a feeling of revulsion as regards American securities, and Paris, in the year prior to the outbreak of war, was steadily selling them. On the other hand, Germany was increasing her creditor position in the world's markets. The Paris *bourse* witnessed the end in 1911 of a bull campaign which had lasted for several years, and 1912 saw a persistent depression in gilt-edged stocks. The price of French 3% Rentes, which touched 105 in 1898, when Mr. Cochery dreamed of conversion, fell to 87½ in 1912, and with the outbreak of the Balkan War there was a panic.

The *bourse* was reopened after the events of Sept. 1914, on Dec. 7, and thereafter there was a steady rise in prices. After 15 months of war the first war loan was raised. As a necessary preliminary the settlement of the long-deferred end of July 1914 *bourse* account was begun on Sept. 30 1915, and was carried through with comparative ease. The open account had been very largely reduced by gradual sales, and the Bank of France came to the rescue of both Parquet and Coulisse, lending the former about 150 and the latter 35 million francs. The plan of settlement adopted differed considerably from the London Stock Exchange scheme—5% interest was charged from July 1914, to Sept. 1915; holders were asked to pay their differences in full, or were given the option of paying 10% of their differences at the first settlement, and 10% on each subsequent monthly settlement until the balance was wiped off; 6% was fixed as the rate on all unpaid differences; from the make-up prices of the end-Sept. account differences had to be settled at each settlement as before the war. After the first *post-bellum* settlement contangoes averaged about 4½ per cent. All new business was for cash, dealing on account being confined to clearing up accounts which existed before Aug. 1 1914.

Berlin.—Before the war the Berlin *bourse* was subject to frequent attacks of nerves. On Sept. 4 1911 the *bourse* had what was described as its worst day of the year. It was alarmed by the foreign political situation. Nevertheless business was very active in that year, and the stamp duty on *bourse* transactions produced £75,000 more than in 1910. In 1912 the *bourse* was again much disturbed by political fears, and rumours of war caused heavy selling from time to time. Excessive speculation in the earlier months of 1912 caused the Government Commissary of the *bourse* to issue a public warning. On Oct. 1 of that year came news of the Balkan mobilization, and a panic seized the market. Settlement stocks in one day lost, on an average, 20 points. The total loss in values in that year was estimated at about £150,000,000. On the outbreak of war, Germany imposed more stringent conditions upon the Stock Exchange business than any other country. The open market for stocks and shares was abolished, and the publication of prices was strictly forbidden. Towards the end of 1915, cautious efforts were made, with some success, to liquidate *bourse* transactions which had remained in suspense since the outbreak of war. In 1916 there was much speculation on the German *bourses*, and this was given as a sufficient reason for continuing the veto upon the publication of quotations. But at the end of that year, lists of prices were issued for the first time since July 1914, for the purpose of taxation assessments. The quotations showed many large gains in industrial securities, due, of course, to the enormous profits made by German companies. In 1916 the dividends of 10 explosives manufacturing concerns averaged 22¾%, a group of metal companies paid out 20%

on a capital of £9,000,000, and a group of leather companies paid 19% on an average. All the German war loans were, however, listed by special instruction at the price of issue. In 1917 there was again considerable speculation on the *bourses*, with generally rising prices, but the intervention of the United States in the war caused a set-back. At the end of 1917 the listing of prices was resumed, but publication of prices was strictly prohibited. German 3% stock rose 7 to 8 points, and there was a strong demand for industrials. Between Sept. and Dec. 1918 the quotations of German securities on the German markets fell so heavily that German financial writers estimated the decrease in capital value at about 50 per cent. Meanwhile Germany witnessed her foreign credit—such as it was—go to pieces. This was proved not only by the price of the mark, but by an almost universal desire in neutral countries to withdraw outstanding credits to Germany. The index figures prepared by the *Frankfurter Zeitung* showed the following (*a.* representing values of 24 of the principal shipping, mining and dyeing concerns; *b.* of 10 important munitions, metal, petroleum and potash concerns. The table shows the effect of speculation before the German collapse, then a heavy fall, followed by a slight recovery at the end of 1918):—

	July 28 1914	Dec. 31 1917	Aug. 31 1918	Dec. 5 1918	Dec. 31 1918
a.	185	278	272	151	164
b.	232	445	442	177	197½

Amsterdam.—The Amsterdam Stock Exchange, which was closed on the outbreak of war in 1914, was reopened on Feb. 9 1915. Business at first was not very extensive, except in shipping and home industrial shares. Foreign stocks were very weak in 1915 owing to persistent selling from Germany. The year 1916 was a record of remarkable fluctuations, and at the close all kinds of shares showed enormous gains. The largest improvement took place in the securities of home industrial concerns, which made huge profits, as the result of the elimination of German competition. The Dutch Indian plantation companies made enormous profits, especially the sugar plantations, which sold a great part of their output to the British Government at high prices. Rubber and tobacco shares also improved in value. Royal Dutch shares were introduced for the first time on the American market in 1916. In 1917 the stock markets were rather quiet. Russian stocks fell enormously in the last months in consequence of the stoppage of interest payments, and the announcement that the Bolshevist Government would cancel the national debt. This latter step could only mean a serious financial disaster for Holland, where Russian stocks had found a ready market as being thoroughly sound investments. The total Dutch ownership of Russian stocks of State as well as private railways was estimated at 1,500,000,000 to 2,000,000,000 florins. New shipping shares amounting to 27,500,000 florins in face value were added to the market in 1917. In the following year the tendency was irregular, and sometimes weak, directly owing to the German collapse, but towards the end of the year prices rose again. Large new issues were made by shipping, plantation, and trading companies.

Vienna and Budapest.—In the early years of the war there was extravagant speculation on the Vienna and Budapest *bourses*, and prices rose to extraordinary heights on the enormous profits on paper made by all the industries of the country. But a heavy collapse succeeded the military breakdown in 1918, and the subsequent break-up of the old Empire.

Switzerland.—Following the example of the chief foreign *bourses*, the Basle and Zurich Stock Exchanges suspended operations towards the end of July 1914. The Geneva and Lausanne *bourses*, however, remained open even during August. On Jan. 7 1915 the Basle Stock Exchange resumed the publication of its daily price list. A further step forward was taken on Dec. 1 1915, and on April 25 1916 the bond market was reopened in its entirety. On June 26 transactions were extended to the full pre-war list. The Zurich *bourse* restarted official business on May 15 1916. (C. J. M.)

STOKER, BRAM (1847–1912), Irish author, was born in Dublin Nov. 8 1847 and was educated at a private school there and at Trinity College. He entered the Irish civil service, to which his father also belonged, and wrote critical articles for various newspapers. He was called to the English bar, but in 1878 he joined Sir Henry Irving at the Lyceum theatre and was for many years his secretary and finally his biographer. He wrote a number of novels, of which *Dracula* (1897) was the best known, as well as *Personal Reminiscences of Sir Henry Irving* (1906). He died in London April 20 1912.

STOLYPIN, PETER ARCADEVICH (1863–1911), Russian statesman, was born in 1863, the son of Admiral Stolypin by his wife, a princess of the house of Gorchakov. He was educated at the university of St. Petersburg, and in 1884 entered the Government service. In 1902 he was appointed governor of Grodno, and in 1905 was transferred to Saratov, where he became known as a firm administrator. In 1906 he was recalled to take up the position of Minister of Internal Affairs, and in July of the same year succeeded Goremykin as Minister President. His career as Premier is described in the article RUSSIA. His firm and repressive policy toward all kinds of sedition caused him to be regarded as a deadly enemy by the revolutionary party, and many attempts upon his life were made. In Aug. 1906 a bomb was exploded at his summer residence, which seriously injured one of his daughters, but all efforts to kill him proved vain until 1911, when he was shot in a theatre at Kiev on Sept. 14, before the eyes of the Imperial family, by a Jew named Mordka Bogrov. The minister died of his wounds Sept. 18 1911.

STONE, MARCUS (1840–1921), English painter (*see* 25.957), died in London March 24 1921.

STONE, MELVILLE ELIJAH (1848–), American journalist, was born at Hudson, Ill., Aug. 22 1848. His father was a Methodist minister, of New York birth, who had moved to Illinois in early life and combined his activities as a circuit-preacher with the running of various small businesses, including book-selling and printing. He had English, Scottish and Irish blood in his veins, the Stone family having settled in New England in the 17th century. In 1860, when Melville was 12, his father was made pastor of a Methodist church in Chicago, and it was there that he got his schooling. In 1864 he began work as a newspaper reporter, but after sundry journalistic experiences he was set up in business in 1868 as proprietor of an iron-foundry and machine-shop, which incidentally made a specialty of the supply of folding theatre-chairs, etc. In the great Chicago fire of 1871 this was destroyed, and Stone was then for some time occupied in the administrative work of municipal relief and reconstruction after the fire. But in 1872 he again took up journalism, as one of the editors of the Chicago *Republican* (subsequently *Inter-Ocean*), and later of the *Post and Mail*, becoming for several years a political correspondent at Washington. At the end of 1875, having returned to Chicago, he and a colleague started a new Chicago paper, the evening *Daily News* (*see* 19.571), and, after he had obtained the help of a new partner in Victor F. Lawson as its manager, their venture soon became increasingly prosperous. In 1878 he and Lawson bought out the *Post and Mail*, and in 1881 they established the *Morning News* (later *Record* and *Record-Herald*). In 1888 Stone's interest was bought out by Lawson, and he retired, taking a prolonged holiday in Europe. Returning to Chicago in 1891, he took to banking by the foundation of the Globe National Bank, of which he became president, and he kept up this connexion for about ten years; but meanwhile pressure was put on him to take part in the reorganization of the Associated Press, then already a well-known news-agency, and in 1893 he accepted the position of general manager. In this capacity Melville Stone became even more prominent and powerful in the journalistic world than he had been as a Chicago editor and newspaper proprietor. At that time the Associated Press was still struggling (*see* 19.547) with its competitor, the United Press, but its enterprise now received a new stimulus, and by 1897, under Stone's management, and as subsequently reorganized in 1901, its service knew no rival. Stone had intimate relations with all the leading men of his time and played an important part in the publicity given to events and movements. He held this position until the close of 1918, when he retired. During that period of 25 years the budget of the Associated Press had grown from $500,000 to $6,000,000 and it had come to furnish more than half the news printed in American newspapers.

See the Autobiography: *Fifty Years a Journalist* (1921).

STOREY, GEORGE ADOLPHUS (1834–1919), English painter, was born in London Jan. 7 1834. He was partly educated in Paris, but in 1850 returned to England and commenced studying in London at J. M. Leigh's school, subsequently entering the Royal Academy schools. His first picture was hung in 1852. He was in early life a follower of the Pre-Raphaelite school, but gradually changed his style, becoming well known both as a subject painter and for his excellent portraits. He was elected A.R.A. in 1876 and R.A. in 1914. He became teacher of perspective at the Royal Academy in 1900. Among his best-known pictures are "The Old Soldier" (1869); "Christmas Visitors" (1874); "Mischief" (1897) and "The Love-Letter" (1901). Storey published several books, the most important being *Meissonier* (1886) and *Theory and Practice of Perspective* (1910). He died at Hampstead July 29 1919.

STORY-MASKELYNE, MERVYN HERBERT NEVIL (1823–1911), English mineralogist, was born near Wroughton, Wilts, Sept. 3 1823; he was descended on the mother's side from Nevil Maskelyne, the Astronomer Royal. He was educated at Bruton grammar school and Wadham College, Oxford, and studied for the bar, but in 1850 was invited to deliver lectures at Oxford on minerals, where he stipulated for a chemical laboratory, then a complete novelty in the university. He was prominent in the struggle over the proposal to erect a museum of science and in 1856 became professor of mineralogy with a laboratory in the new museum; but from 1857 he combined the work with the keepership of the minerals at the British Museum and resided in London. In 1880 he resigned this post, but retained his Oxford professorship until 1895. He had inherited a Wiltshire estate from his father, and in 1880 he entered Parliament as Liberal member for Cricklade. In 1885 he was reëlected for N. Wilts as a Liberal Unionist and sat until 1892. He studied especially crystallography, meteorites and gem-stones, and was the author of many scientific papers, and of a book *On the Morphology of Crystals*. He also possessed a valuable collection of antique gems. He died at Bass Down, near Swindon, May 20 1911.

STOUT, SIR ROBERT (1844–), New Zealand judge and statesman, was born on Sept. 28 1844 at Lerwick, Shetland Isles, where he was educated at the parish school and became a pupil teacher. He arrived in New Zealand in 1863, and became second master in the Dunedin grammar school and afterwards in the Dunedin district high school. On July 4 1871 he was admitted as a barrister and solicitor of the Supreme Court of New Zealand, and he then matriculated at Otago University which opened in that month. In 1873 he took first-class honours in mental and moral science and political economy, and from 1874 to 1876 he was Law lecturer at Otago University. Elected a member of the Otago Provincial Council in 1872, he became provincial solicitor in 1873, and he held that position until the abolition of the provinces in 1876. In 1875 he was elected to Parliament as Liberal member for Caversham and in Feb. 1878 he became Attorney-General and Minister of Lands and Minister of Immigration in Sir George Grey's Ministry. But in the following year he resigned owing to the serious illness of his partner, and he did not return to public life till 1884 when he entered Parliament again as member (M.H.R.) for Dunedin East. On the defeat of Sir Harry Atkinson's Government he joined with Sir Jules Vogel in forming a Ministry, which lasted less than a fortnight (Aug. 16–28 1884), but after another Atkinson Government had held office for a few days (Aug. 28–Sept. 3) a second Stout-Vogel Government was formed which lasted three years. In both the Stout-Vogel Governments Sir Robert Stout was Premier and Attorney-General. At the general election in 1887 the Government was defeated and he lost his seat by a narrow margin.

Refusing the offer of other seats, Sir Robert Stout remained out of politics till after the beginning of the long Liberal-Labour régime in 1891. Both by Ballance and by Seddon he was offered a portfolio but he declined both offers. In June 1893, however, he was elected at a by-election for Inangahua as an Independent Liberal, and at the general elections of 1893 and 1896 he was elected for Wellington City, to which he transferred his residence and his legal practice. In 1898 Sir Robert Stout resigned his seat, and in June 1899 he became Chief Justice.

In politics Sir Robert Stout was a strong Liberal of the individualistic school, devoting special attention to the land and labour questions and to educational and temperance reform. Among his principal measures were the Land Act of 1877, the first Land Tax Act, which he drafted in coöperation with Ballance and which became law in 1878, and the Civil Service Reform Act of 1886, which threw the doors of the service open to women and made examination and competition (the latter being added by the Legislative Council) the tests of all appointments except those of experts. As a member of a Royal Commission appointed in 1881 he helped the late Mr. Allen Holmes in forming the Code of Civil Procedure, which was enacted in the following year and made the Supreme Court Procedure of New Zealand one of the simplest in the world. A life-long abstainer, Sir Robert Stout was always a keen advocate of temperance reform. The local option bills which he introduced in 1876 and 1893 did not get further than their second reading, but the second of these measures forced the hand of the Seddon Government and led to the establishment of local option by a less liberal measure in the same session.

He became a member of the New Zealand University Senate in 1884, and also of the Victoria University College Council, Wellington. In 1903 he was elected chancellor of the university. He was made a K.C.M.G. in 1886. Besides writing many essays and lectures on social, literary and legal subjects, he was the author, jointly with his son, J. Logan Stout, of *New Zealand* in the Cambridge University Manuals of Literature and Science, and of the article on New Zealand in the Oxford University Survey of the British Empire. He married in 1876 Anna Penrhyn, daughter of Mr. J. Logan, official clerk to the Superintendent of the Province of Otago. He had four sons—of whom two served in the war as medical men and one obtained the D.S.O.—and two daughters.

STRACHAN-DAVIDSON, JAMES LEIGH (1843–1916), British classical scholar, was born at Byfleet, Surrey, Oct. 22 1843, and educated at Leamington College and Balliol College, Oxford. He graduated first class in *literae humaniores* in 1866, and was elected to a fellowship of his college the same year. This he held until 1907 when, on the resignation of Edward Caird, he was elected to the mastership of the college. His whole life was devoted to university teaching and administration, as classical tutor, examiner, delegate of non-collegiate students, pro-vice-chancellor, etc., and to the study of Roman history. Amongst his published works were *Cicero and the Fall of the Roman Republic* (1894), *Problems of the Roman Criminal Law* (1912), as well as articles on the Roman Constitution in *Smith's Dictionary of Antiquities*. He died at Oxford March 28 1916.

STRACHEY, JOHN ST. LOE (1860–), English journalist, was born at Sutton Court, Som., Feb. 9 1860, the second son of Sir Edward Strachey, 3rd Bart., and Mary Isabella, daughter of John Addington Symonds. He was educated at Balliol College, Oxford, graduating with a first-class in modern history, and was subsequently called to the bar; but he adopted journalism as his profession from the age of twenty-four. In 1886 he became assistant editor of the *Spectator*, and after the death of R. H. Hutton (1897) and the retirement of Meredith Townsend (1898) he became proprietor of the paper, which under his editorship not only maintained but increased the high reputation it had gained (*see* 19.562) for sober political criticism and well-informed appreciation of art and literature, so that he exercised great influence upon English opinion. St. Loe Strachey also edited (1896–7) the *Cornhill Magazine*. He was specially interested in problems of rural housing, pauperism and local government generally. Amongst his publications are: *The Manufacture of Paupers* (1907); *Problems and Perils of Socialism* (1908); *The Practical Wisdom of the Bible* (1908); *A New Way of Life* (1909).

STRAIGHT, SIR DOUGLAS (1844–1914), English lawyer and journalist, was born in London Oct. 22 1844 and was educated at Harrow. Up to 1865 he engaged in journalism, but was then called to the bar and soon worked up an extensive practice, especially at the Central Criminal Court, London. He sat in the House of Commons as Conservative member for Shrewsbury from 1870 to 1874, and from 1879 to 1892 he was a judge of the High Court of Judicature at Allahabad. He was knighted on retirement, and four years later he returned to journalism as editor of the *Pall Mall Gazette*. He retired in 1909, and died in London June 4 1914.

STRAITS (DARDANELLES AND BOSPORUS.)—The waterway formed by the Dardanelles, the Sea of Marmora and the Bosporus, which connects the Mediterranean and the Black Sea, has possessed marked political importance from the earliest times. This importance, however, grew with increasing rapidity during the 20th century. The increase of population, the growth of commerce, the construction of railways, and the rise of nations in the basin of the Black Sea, enormously added to the political and military significance of the Straits. And while these factors gained in weight yearly, the Ottoman Empire, which held the guardianship of the Straits, declined yearly in vigour and strength. Correspondingly, it became more and more the object of national intrigue and ambition on the part of foreign Powers, whose designs would benefit were they in a position to control the Straits themselves.

These matters received forcible illustration during the World War. Problems having their origin in the existence of the Straits became then of supreme importance, even to the extent of prolonging or shortening the period of war. At the Peace Conference, too, questions of the Straits became acute. The seaborne commerce of the 100 million inhabitants occupying the basin of the Black Sea must perforce pass through the Straits. By railway communication with central Asia this region, too, is concerned with control of the Straits. The traditional Russian ambition for a warm water port looked to Constantinople and the Straits for fulfilment; and in 1915 the Powers in alliance with Russia accepted the Russian claim to the great position. Apart from Russia and Turkey, three states—Georgia, Rumania and Bulgaria—had a coast-line confined to the Black Sea, and therefore depend upon the Straits as the one route for their maritime trade with the outer seas. To Germany, control of the Straits in war by her ally Turkey meant the isolation and strangling of her enemies, Russia and Rumania. In fact the closing of the Straits at this time had much to do with the collapse of Russia, the outbreak of the revolution, and the prolongation of the war. With such possibilities and interests hanging upon them, the Peace Conference dealt comprehensively with the Straits in the Treaty of Sèvres. Under this treaty they were thrown open to all navigation in peace and war, without distinction of flag, and blockade of these waters was prohibited. An International "Commission of the Straits" was established to control the waterway. And still further to ensure that military interruption should not take place, a demilitarized "Zone of the Straits" was created, embracing all adjoining coastal territory. Within this area all military works and fortifications were to be razed, and the construction of similar works was forbidden.

(W. J. C.*)

STRAITS SETTLEMENTS AND DEPENDENCIES (*see* 25.980*).—The resident pop. of the Straits Settlements proper, according to the census of 1911, was 705,405, divided as follows: Singapore, 303,321; Penang, 141,559; Province Wellesley, 128,978; Malacca, 124,081; the Dindings, 7,466. Males outnumbered females nearly as 2 to 1. Included also in the Government of the Straits Settlements are Labuan (pop. in 1911, 6,546), Christmas Island (1,369) and the Cocos Islands (749).

In Labuan and Cocos Islands males did not greatly outnumber females, but in Christmas Island, with an almost wholly labouring pop., males were 1,328 and females 41.

In 1919 the pop. of the whole colony was estimated at 827,719. That of Christmas I. was 514 on Jan. 1 and 617 on Dec. 31.

In the colony the birth-rate in 1919 was 30·3 per thousand. The death-rate, which was 46·45 per thousand in 1911, fell to 29·15 in 1915, rose, with an epidemic of influenza, to 43·85 in 1918, and was 33·04 in 1919. The principal causes of death in the last year were infant diseases (5,848) and malaria (4,623), and the other most serious maladies as returned were tuberculosis, beri-beri, pneumonia, and dysentery, but probably many deaths were due primarily to influenza. The epidemic of this disease resulted in the revival, after 30 years, of the native *wang-kang* ceremony at Malacca, in which a model boat is constructed in a temporary temple, and is subsequently burnt as a sacrifice to some supposedly neglected god.

Principal nationalities and religions were shown by the census as follows:—

Nationalities

	Chinese	Malay	Indian	Europ. and Amer.
Straits Setts. proper	366,765	235,762	81,928	7,276
Labuan	1,799	4,434	—	34
Christmas I.	1,252	44	—	19
Cocos Is.	—	668	—	39

Religions

	Chinese[1]	Mahommedan	Hindu	Christian
Straits Setts. proper	359,760	261,154	52,579	24,474
Labuan	—	4,430	—	116
Christmas I.	—	46	—	32
Cocos Is.	—	669	—	50

[1] Other than Mahommedan and Christian.

Chinese immigrants in 1919 numbered 70,912—21·4% more than in 1918, and 73·6% less than in the "record" year, 1911. Adult males were 62·4% and females 19·5%. 101,433 immigrants arrived at Penang from southern India, and 46,767 Indians quitted the colony. There were 2,439 labourers from Netherlands India.

The Chinese community was on the whole prosperous during the World War; the increased cost of living and the high rate of exchange with China bore hardly upon the poorer classes, but the increase of wages in great measure counterbalanced these disadvantages. The Chinese freely supported patriotic and charitable funds, and after some demur, before its purpose was fully understood, recognized without further difficulty the war-tax ordinance of 1917. The war, however, produced its problems for the community. It was necessary to establish a censorship of Chinese newspapers, and in June 1919 an anti-Japanese boycott resulted in rioting in Singapore and Penang, while a Chinese patriotic league and an anarchical body, the so-called Truth Society, gave some trouble.

Finance.—Revenue in 1911 amounted to $11,409,220, in 1919 to $34,108,465; expenditure in 1911 to $9,085,389, in 1919 to $34,901,233 ($1 = 2s. 4d.). A noteworthy financial measure was the introduction of an income tax, which, in spite of controversy, raised £400,000 sterling in 1917 without friction.

The colony had at the end of 1919 a debt of £6,913,352 sterling in respect of the loan raised by the issue of 3½% Straits Settlements inscribed stock, 1907. About four-fifths of this loan was expended on account of the Singapore Harbour Board, and the rest on account of the Penang Harbour Board, the municipal commissioners of Singapore and Penang, and on Government harbour works, and interest charges are borne by these bodies.

Among Government monopolies that of opium is by far the most productive; the sales of chandu in the colony in 1919 yielded $17,511,229, in addition to which there were sales to the Federated and Non-Federated Malay States and Brunei. But prices were raised and other measures were taken in that year with a view to the gradual reduction of the amount of opium consumed.

Economic conditions: Agriculture, etc.—In many respects the colony actually benefited from the World War: there was, for instance, an increase in the gross value of trade from £63,600,000 in 1914 to £148,200,000 sterling in 1917. The more serious economic problems were not all results of the war. For example, it was about 1909–10 that a remarkable development of agricultural activity set in, especially in Malacca and Province Wellesley. This took the direction mainly of rubber planting, which led to the neglect of fruit cultivation and other forms of native agriculture; and this tendency has persisted. It has been asserted, indeed, that the rubber industry has been overexploited here: the people ceased in great measure to cultivate their own food crops and raise their own live stock, and became dependent on imported food stuffs. In 1917 rice was imported from Rangoon, Siam, and French Indo-China; wheat flour from Australia and India; cold storage foodstuffs from Australia, and other foodstuffs from China. Difficulties connected with shortage of supplies and shipping made it necessary to set up food control in 1917. An enquiry was instituted into measures for increasing home produce of rice and other foods, and "cultivation clauses" were inserted into leases of newly alienated lands. In 1918 the United States restricted imports of rubber, with a consequent reaction upon the Straits Settlements industry. This could not, however, immediately affect food cultivations, and in that year shortage in India, floods in Siam, and the demand for imported rice in Java and

Japan caused serious conditions in the Straits Settlements. Siam prohibited export of rice in July 1919: the Straits Settlements controller took entire charge of import and wholesale dealing, and a food production department was established which fostered home planting, and in spite of many difficulties it was found possible, early in 1920, to ensure supplies for several months. The Governments of the Straits Settlements, Netherlands India, and Ceylon agreed in 1919 to purchase through a single agent to avoid competition.

The cultivation and yield of coco-nuts declined in and after 1917, and the destruction of palms to make room for rubber had advanced so far in Singapore and Province Wellesley that an enactment was directed against it. Copra prices, however, rose in 1919. The clove, nutmeg, gambier, and areça nut industries of Penang shared in the general decline of cultivations which had become subsidiary to that of rubber. The pineapple cultivation was affected by the difficulty of obtaining tin plate for the canning industry. As for live stock (of which mention has been made above) a report for 1917 showed that whereas in 1910 Malacca exported 12,000 pigs, in the later year that number was imported, and that the former large export of poultry from Penang was more than balanced by import.

Forestry.—Measures have been taken to amalgamate the forest services of the Straits Settlements and the Federated Malay States, the first step being taken in 1918, when the forests of Malacca were placed under the deputy conservator of forests for Negri Sembilan. The area of reserved forests in 1920 was 107,270 ac., about 11% of lands in the colony. The mangrove industry has been fostered by imposing a control over cutting, and by replanting, over 2,000,000 seedlings having been planted in Penang and the Dindings in 1919.

Tin.—War conditions reacted favourably upon the tin trade. In July 1918 the price reached $160 per picul, and subsequently $185 when buying was prohibited except under licence. But after the Armistice the price, already declining, was further lowered when the Imperial Government ceased to buy direct, and the Federated Malay States had to guarantee purchase at $118 per picul.

Commerce.—Imports were valued at £43,856,000 sterling in 1914, and exports at £38,032,000. Both rose annually thereafter almost without exception, until in 1919 the figures were: imports, £96,664,000; exports, £99,318,000. The *entrepôt* trade in tin and Pará rubber is illustrated by the following figures for 1919:—

Imports (piculs)			
From	Tin	Tin Ore	Rubber
Malay States	133,000	686,000	1,412,000
Netherlands India	38,000	113,000	456,000
Siam	6,000	207,000	—
Other countries	2,000	32,000	79,000

Exports				
To	Tin, piculs	Value	Rubber, piculs	Value
United Kingdom	324,000	$41,347,000	406,000	$ 44,088,000
United States	454,000	$59,928,000	2,310,000	$230,511,000
Elsewhere	219,000	$27,445,000	254,000	$ 24,227,000

Shipping.—The total tonnage of shipping entered and cleared for the year 1919 is shown as follows: Singapore 14,088,775; Penang, 4,009,126; Malacca, 564,400; Christmas I. and Labuan, 222,882. The principal flags were British (nearly five-ninths of the whole), Japanese, and Dutch, and the total increase over the year 1918 was 5,820,913, nearly four-fifths of which was in British shipping. The total of 18,885,183 tons thus compares with 13,064,270 tons for 1918 when the shortage of shipping was most acute, and with 27,124,789 tons in 1913.

Work on the Lagoon wet dock and main wharf reconstruction, Tanjong Pagar, was completed and made over to the Singapore Harbour Board in May 1917. The revenue and expenditure of the Board, which reached $6,015,648 and $4,216,015 respectively in 1912, declined to $5,432,425 and $3,421,271 in 1915, and amounted to $9,617,718 and $5,444,410 in 1918. Penang wharf and dock receipts amounted in 1919 to $996,372 (approximately), and expenditure to $815,092. The wharf tonnage returns for Singapore and Penang show the following figures:—

		No. of Vessels	Net Tonnage	Inbound and Outbound	
				Coal, tons	Cargo, tons
Singapore	1913	2,708	5,794,536	1,338,495	1,462,788
	1918	2,114	3,330,791	732,231	1,213,730
Penang	1913	732	1,532,361	282,067	399,412
	1918	513	581,132	60,029	251,183

Land Communications.—The Singapore Railway Transfer Ordinance, 1918, enabled the Government of the Federated Malay States to construct a causeway across Johor Straits and to lay a railway to connect the Singapore line with the Johor and Federated Malay States systems. The sale of the Singapore Railway and railway stores involved a sum of $4,149,750. Metalled roads in the colony at the end of 1919 had a length of 584 m. (Singapore, 96 m.; Penang and the Dindings, 86 m.; Province Wellesley, 166 m.; Malacca, 231 m.; Labuan, 5 m.); and the Public Works Department had charge, in addition, of 50 m. of gravelled roads in Malacca, and 93 m. of "natural" roads in Penang, the Dindings, and Prov. Wellesley.

Education.—The centenary of the modern foundation of Singapore by Sir Stamford Raffles was the occasion of local celebrations in Feb. 1919, and by way of commemoration it was decided to found a Raffles College for higher education. Evidence of the general enthusiasm for this scheme was given by the prompt provision of subscriptions which ensured its success and enabled plans to be laid forthwith. The Straits Settlements Government promised a donation of $1,000,000 and an annual contribution of $50,000: the Governments of the Federated Malay States and Johor, and many private individuals, contributed. There have been other signs of a demand for a more active education policy; it being especially desirable as a counter measure against undesirable propaganda.

The Government maintained in 1919 eight English schools, and aided 45 English, Anglo-Tamil, Malay, Tamil, and Chinese schools: it also supported the Malacca Training College for Malay teachers. The Central Training College in Perak, the erection of which was started in that year, is intended for Malay teachers not only in the Federated Malay States but also in the Straits Settlements.

Labuan.—Revenue collected in Labuan in 1919 amounted to $38,308, and expenditure was $81,927. The total value of trade was $3,748,930 in that year, and $2,763,561 in 1918. Merchant shipping entered and cleared amounted to 141,686 tons in 1919. The Labuan Exploration Co. of London undertook a geological survey in 1920 with the view of prospecting for minerals.

Christmas Island.—Revenue (1919), $26,155; expenditure, $12,791. The export of phosphate of lime, which reached 89,889 tons in 1917, showing a large increase, fell to 53,370 tons in 1918 and amounted to 68,621 tons in 1919. The export was taken in 1919 by Japan (71%) and Australia. Shipping entered and cleared amounted to 81,197 tons (61% Japanese). There is a small export of rubber. The phosphate company maintained its output during the war, completed an inclined haulage way, and carried the railway to new quarries at South Point in 1918–9.

Cocos Islands.—A typhoon in 1909 left standing only 3% out of over 1,000,000 coco-nut palms, but replanting was completed in 1911, and export of copra was resumed two years later and reached 800 tons in 1918. An exchange cable station of the Eastern Extension Telegraph Co. and a high-power wireless station are established on Direction Island. The German raider "Emden" landed a party to destroy these on Nov. 9 1914, and was caught and herself destroyed by the "Sydney" of the Australian navy, running ashore on North Keeling Island, while her landing-party captured and escaped in the schooner belonging to the proprietor of the islands.

The governor of the Straits Settlements is high commissioner for the Malay States, Federated and Non-Federated (*see* MALAY STATES), and also for Brunei, and British agent for Sarawak and British North Borneo. These three divisions of northern Borneo are dealt with below.

Brunei (*see* 4.681).—Pop. (1911), 21,718. Revenue (1919), $162,020; expenditure, $138,844. Imports were valued in 1916 at $254,756, and $614,061 in 1919; exports at $734,254 in 1916 and $1,134,864 in 1919, including plantation rubber ($243,596), cutch ($304,249), and coal ($296,621). The demand for sago, wild rubber (jelutong) and other forest produce, and dried fish, was great, and purchase prices ceased to be controlled by a group of traders as previously, which enabled the peasantry to profit to the extent of balancing the high prices of rice and other foodstuffs. Attempts were made to increase home production. The rice crop of 1918–9 failed, but the effort was maintained and rewarded in the following season. Plantation rubber (429,823 lb.) came mainly from the Brunei district, which has become the chief centre of the industry, in place of the Temburong basin. The cutch industry was suffering from the former indiscriminate cutting of mangroves in accessible districts where no replanting had been done, and the production was only maintained at the expense of heavier labour and transport. The Brooketon collieries yielded 29,565 tons of coal in 1918 and 26,274 tons in 1919. Attempts to develop a petroleum field at Tutong at this period were unsuccessful, though it was still expected that later there would be good results. Plantations and mines were encountering a serious shortage of labour, owing to the prosperity of the native traffic in forest produce, etc., above referred to.

Sarawak (*see* 24.207).—Pop. (estimated 1919), 600,000. Revenue (1918), $1,921,964; expenditure, $1,455,692. Imports, $9,908,732; exports, $11,540,190. Gold was exported to the value of $1,256,500 in 1915 and $923,100 in 1918. An extensive oil-field has been developed in Baram district, and 74,400 tons of oil were exported in 1918. Other principal exports include sago, pepper, and jelutong. There are four wireless stations, affording communication with Singapore. Charles Vyner Brooke (b. 1874) succeeded his father, Sir Charles Johnson Brooke, as rajah on May 17 1917.

British North Borneo (*see* 4.262).—Pop. (1911), 208,183; (estimated 1919), 227,000. The revenue of the British North Borneo Chartered Company (exclusive of land sales) has shown unbroken increase since 1910, from £170,767 in that year to £234,804 in 1914 and £373,936 in 1919; expenditure for 1919 amounted to £193,230. Imports were valued in 1919 at £925,235, and exports at £1,453,990, including rubber (£782,037), tobacco (mostly grown on estates; £230,122), coal (£78,706), copra (£39,629), cutch (£24,651), sago, and dried fish. The company's railway from Jesselton extends to Melalap in the interior, and has a branch from Beaufort to Weston, and a total length of 130 miles. There are four wireless stations. A Legislative Council was established in 1911 to aid the governor and civil staff in the local administration: the commercial, planting, Chinese, and native communities are represented on it. The company created an opium monopoly department in 1913, following the policy of the Straits Settlements Government. (O. J. R. H.)

STRANG, WILLIAM (1859–1921), British painter-etcher (*see* 25.982), was in 1918 elected president of the International Society of Sculptors, Painters and Gravers. In 1909 the degree of LL.D. was conferred upon him by Glasgow University. His later work includes the etchings "The Little Flower Girl" (1909); "Nymph and Shepherds" (1910); "On the Omnibus" (1911); "The Walls of the Alhambra" (1912) and "The Mirror" (1912); besides various portraits, including one of Thomas Hardy (1910). He had only recently been elected a full R.A. when he died suddenly at Bournemouth, on April 12 1921.

See *Catalogue of William Strang's Etched Work, 1882–1912* (1912).

STRATEGY: *see* TACTICS.

STRATHCONA AND MOUNT ROYAL, DONALD ALEXANDER SMITH, 1ST BARON (1820–1914), Canadian statesman (*see* 25.1000), died in London Jan. 21 1914. His barony passed by special remainder to his daughter Margaret Charlotte, wife of Robert Jared Bliss Howard, of Montreal (d. 1921).

STRAUSS, RICHARD (1864–), German composer (*see* 25.1003). His opera, *Ariadne auf Naxos* (1912), was produced at His Majesty's theatre by Thomas Beecham in May 1913 and the same year *Der Rosenkavalier*, first produced at Dresden in 1910, was performed at Covent Garden with great success, eight performances being given; in point of fact, this proved to be Strauss's most popular opera. His other recent works include *Festliches Praeludium*, for orchestra (1913), and *Josephs Legende* (1914). In addition to the works enumerated mention should be made of *Eine Alpensinfonie*, (1915, op. 64); and the three-act opera, *Die Frau ohne Schatten*, libretto by Hugo von Hofmannsthal (1916, op. 65). In the winter of 1920–1 Strauss visited S. America, where he officiated at Buenos Aires as opera conductor, subsequently returning to Vienna.

STRAVINSKY, IGOR (1882–), Russian musical composer, was born at Oranienbaum, near St. Petersburg, June 18 (O.S. June 5) 1882. His father was an opera singer, who early discovered his son's remarkable musical gifts. At the same time, however, he wished the boy not to devote himself entirely to music but to study law, and with this end in view Igor Stravinsky entered the University of St. Petersburg. At the age of 22, however, a meeting with Rimsky-Korsakov decided him in the direction of a musical career, and the former declared himself ready to take Stravinsky as a pupil. His first work for orchestra was a symphony (1907), followed by a suite, *Faune et Bergère*, and two short works, also for orchestra, *Feu d'artifice* and *Scherzo fantastique*. A meeting with Serge Diaghiliev turned his attention to the possibilities of the ballet, and in rapid succession appeared *L'Oiseau de feu* (1910), *Petrouchka* (1911), and *Le Sacre du Printemps* (1913). His next important work was an opera, *Le Rossignol* (1914), founded on Hans Andersen's fairy story of *The Nightingale*, of which the second and third acts were later worked up into a symphonic poem, *Le Chant du Rossignol* (1917). The opera was produced at Covent Garden in 1920, and the same year appeared a revision by Stravinsky of Pergolesi's *Pulcinella*.

STREUVELS, STIJN, the pen-name of FRANK LATEUR (1871–), Flemish author, who was born at Heule, West Flanders, Oct. 4 1871. He was a nephew of Guido Gezelle (1830–1899), a celebrated Flemish poet, and until 1905 worked as a baker at Avelghem, a village near Courtrai in West Flanders. Writing in the West Flemish dialect, he was accepted in Belgium and Holland as the most distinguished Low Dutch author of his day. He produced many short stories, including *Openlucht* (1905) and *De Vlaschaard* (1908), a collection of which, translated into English by A. Teixeira de Mattos, appeared in 1913 under the title of *The Path of Life*. In 1912 appeared *Het glorierijke Licht* ("The Glorious Light").

STRIKES AND LOCK-OUTS (*see* 25.1024).—In the following account of later developments between 1907 and 1921, strikes in the United Kingdom are first dealt with, sections following for other countries.

(A) UNITED KINGDOM

I. *Statistics.*—Table 1 shows the total number of strikes or lock-outs recorded in each year from 1907 to 1920, inclusive; the number of workpeople involved therein, and the aggregate loss of working days due to these disputes.

Table 1.

	No. of Disputes	No. of Workpeople Directly and Indirectly Involved	Aggregate Duration of Disputes in Working Days
1907 . .	601	147,000	2,162,000
1908 . .	399	296,000	10,834,000
1909 . .	436	301,000	2,774,000
1910 . .	531	515,000	9,895,000
1911 . .	903	962,000	10,320,000
1912 . .	857	1,463,000	40,915,000
1913 . .	1,497	689,000	11,631,000
1914 . .	999	449,000	10,111,000
1915 . .	707	453,000	3,040,000
1916 . .	578	281,000	2,581,000
1917 . .	803	885,000	5,809,000
1918 . .	1,300	1,142,000	6,332,000
1919 . .	1,413	2,515,000	34,903,000
1920 . .	1,715	1,932,000	27,011,000

It will be seen that the figures show a general advancing tendency, partially checked during the World War. The total for the year 1920 shows the highest figure ever recorded for number of disputes, the highest figure (with one exception) for the number of workpeople involved, and the highest figure (with three exceptions) for the aggregate duration of disputes. The exceptions in this latter case are 1893, with 30,468,000 working days; 1912, with 40,915,000 working days; and 1919, with 34,903,000 working days. In 1893, 1912 and 1920 the high figures were principally due to great coal strikes; the year 1919 was a year of great industrial unrest.

As showing the general advancing tendency of the figures, it may be instructive to compare the average of the four years 1907–10 with the average of the four years 1917–20:—

	Average of Years 1907–10	Average of Years 1917–20
No. of Disputes . . .	492	1,308
No. of Workpeople Involved	315,000	1,633,500
Aggregate Duration (in Working Days) . .	6,416,000	18,511,000

It should be stated that the increase in the number of disputes may be partly accounted for by improved facilities for obtaining information with regard to minor disputes, which may have previously escaped notice; but this will not account for more than an insignificant part of the increase in the figures for number of workpeople involved and for aggregate duration, since the greater disputes, involving large numbers of workpeople, have always been well reported in the newspapers. Table 2 (p. 583) shows the distribution of strikes between the principal groups of trades, taking the averages for the 10 years 1911–20.

Table 2 shows that the average number of workpeople involved in each dispute was a little over 1,000, and that the average duration of disputes was about 14 days. The figures, however, vary widely as between one trade and another. Thus, the average number of workpeople varies from a little more than 200, in the building trades, to over 3,000 in the mining and quarrying group; while the average duration varies from 8 days, in the transport trades, to 27 days in the building trades.

The figure for average numbers involved, and still more that for the average duration, give an exaggerated idea of what may be called the "normal" magnitude and duration of a strike. It is the great strikes, involving many thousands of workpeople, that are commonly also the hardest fought and the most prolonged. Great masses of workers are not mobilized for industrial conflict except for some object which they regard as of first-class importance; and it is exceptional for a strike or lock-out of this magnitude to occur unless all means of reaching a pacific settlement have been exhausted, and unless both employers and workpeople are organized in strong combinations, with great financial resources. All these factors tend to prolong precisely those strikes—in reality a small minority—which involve large numbers of workpeople, and thus exaggerate enormously the figure for "aggregate duration." For example, nearly 40% of the aggregate duration of disputes in the building trades was due to the great dispute in the London building trade in 1914, which lasted for more than six months and accounted for about 2,500,000 working days. In the mining and quarrying industry, two-thirds of the total aggregate duration of all the disputes was due to the two great coal strikes of 1912 and of 1920; if these were eliminated, the average number involved in disputes in this group of trades would be reduced from over 3,000 to 1,800, and the average duration from 14 to 8 days. The case is much the same with the other great groups of trades; and, speaking broadly, it may be said that the vast majority of recorded disputes involve comparatively small numbers of workpeople, and last less than a fortnight—often indeed, only a few days.

To put the same thing in another way. The number of disputes which had an aggregate duration of 25,000 days and upwards varied, in the period 1904–13, from 11 (in 1904) to 72 (in 1913), with an average of 32, or 5% of the total number of disputes. Yet this 5% of disputes accounted for 65% of the number of workpeople involved, and for no less than 86% of the aggregate duration. Or again, the number of disputes in which 2,500 workpeople or upwards were involved varied, in the years 1904–13, from a minimum of 4 (in 1905 and in 1907) to a maximum of 43 (in 1913), with an average of 18, or less than 3% of the total number of disputes; but this 3% of disputes accounted for 67% of the total number of workpeople involved, and for 74% of the aggregate duration.

Some trades are far more subject to industrial disturbance than others; in the building trades the proportion of men who strike or are locked out rarely reaches 1% of the total number employed in the industry, and in the clothing trades the proportion is not much higher; whereas in the coal-mining industry the proportion who strike or are locked out rarely falls below 5% and frequently rises above 20% in a year.

The mean percentages of workpeople involved in disputes for the years 1904–13 were as follows:—

Building trades	0·7
Coal mining	21·4
Other mining and quarrying	2·2
Metal engineering and shipbuilding	3·3
Textile trades	6·4
Clothing trades	1·3
Other trades	1·7
All Trades	4·4

The statistics of *causes* show, on the whole, remarkable regularity. Such fluctuations, as there are, are due principally to the prevalence or otherwise of wage disputes. In years of good or improving trade, strikes for advances in wages are numerous; in years of bad and declining trade such strikes become much fewer.

The statistics of *results* show somewhat less regularity. The principal features of this part of the table are the diminishing proportion of disputes settled in favour of the employers, and the increasing proportion settled by a compromise. In the first half of the period the proportion of disputes settled in favour of the workpeople was 24% on the average; settled in favour of the employers, 44%; and compromised, or partially successful, 32%. In the second half of the period the corresponding percentages were 26, 28, and 46. It should be noted that the second period includes three or four years of exceptional prosperity, a condition which tends to promote settlements in favour of the workpeople; and that this was followed by the period of the war, when prices were constantly rising and industrial conditions were altogether abnormal.

Table 2.

Group of Trades	No. of Disputes	No. of Workpeople involved (Thousands)	Aggregate Duration in Working Days (Thousands of Working Days)
Building	119	25	652
Mining and Quarrying	164	508	7,067
Metal Engineering and Shipbuilding	265	180	2,765
Textile	107	138	2,143
Clothing	58	19	258
Transport	88	150	1,230
Miscellaneous (including Employees of Public Authorities)	260	68	968
Average for all above Trades[1]	1,061	1,088	15,083

Table 3 classifies the disputes of the years 1900 to 1920, (*a*) according to their causes, and (*b*) according to their results:—

Table 3.

Year in which Disputes began	Proportion of Disputes arising on questions of					Proportion of Disputes settled				
	Wages	Hours of Labour	Employment of particular Classes or Persons.	Other Questions	Total	In favour of Workpeople	In favour of Employers	Compromised	Indefinite or Unsettled	Total
...	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.	Per cent.
1900	68	1	14	17	100	31	34	34	1	100
1901	63	4	13	20	100	26	44	30	..	100
1902	60	5	13	22	100	24	47	28	1	100
1903	60	4	14	22	100	23	48	29	..	100
1904	65	4	13	18	100	17	51	32	..	100
1905	66	4	13	17	100	20	47	33	..	100
1906	68	3	11	18	100	32	37	31	..	100
1907	64	3	14	19	100	32	41	27	..	100
1908	62	3	14	21	100	20	44	36	..	100
1909	59	6	14	21	100	18	46	36	..	100
1910	57	4	15	24	100	25	37	38	..	100
1911	64	3	16	17	100	25	32	43	..	100
1912	63	3	17	17	100	27	31	42	..	100
1913	66	3	16	15	100	29	25	46	..	100
1914	63	3	18	16	100	25	33	42	..	100
1915	73	2	12	13	100	23	37	40	..	100
1916	76	3	12	9	100	22	27	51	..	100
1917	73	1	15	11	100	31	20	48	1	100
1918	68	2	17	13	100	29	21	48	2	100
1919	64	11	15	10	100	24	22	54	..	100

II. *Principal Disputes.*—The year 1908 (in contrast to 1907, which was entirely free from any disputes on a great scale) saw three great disputes: (1) a shipbuilding dispute involving 35,000 workpeople, and with an aggregate duration of 1,719,000 working days; (2) an engineering dispute on the N.E. coast, involving 11,000 workpeople, and with an aggregate duration of 1,706,000 working days; and (3) a dispute in the cotton trade, involving 120,000 workpeople, and with an aggregate duration of 4,830,000 working days.

In each of these three disputes the workpeople struck against (or were locked out to enforce) a proposal to reduce wages. This was at one time a common and important cause of disputes; the great coal strike of 1893, for example, was against a reduction in wages. During 1910-20 there were few or no disputes of any importance on this ground; in fact, these three disputes in 1908 were the last important disputes arising out of an attempt to reduce wages, until the ship-joiners' dispute, which, beginning in Dec. 1920, was the precursor of a series of strikes or lock-outs culminating in the coal strike of 1921.

In each of the three disputes referred to above, one or more of the trade unions concerned was prepared, before the strike or lock-out occurred, to accept the terms offered by the employers; but in each case one or more other trade unions resisted the reduction. Modified terms offered by the employers were accepted in all three cases.

There were no important disputes in 1909; but in 1910 several prolonged disputes, involving large numbers took place.

---

[1] Exclusive of the general strike at Dublin in 1913–4, which cannot be classified under any of the separate trade headings. This strike involved about 20,000 workpeople, and had an aggregate duration of about 1,900,000 working days.

Trouble arose in Northumberland and Durham in Jan. 1910, with regard to the working of the coal mines under the Eight Hours Act (the Coal Mines Regulation Act, 1908), which came into operation, in those two counties, on Jan. 1 1910. Agreements had been reached between the two coal owners' associations and the respective miners' union in Dec. 1909, as to the working of the mines under the new arrangements; but a large number of men at the various mines repudiated the agreements, and refused to go down the pits. About 85,000 workpeople were involved in Durham, and about 30,000 in Northumberland. At most of the pits the strike was over by the end of Jan.; but a minority of men stood out, and the strike was not finally settled until April. The aggregate duration of the dispute was about 1,280,000 working days in Durham and about 1,080,000 working days in Northumberland.

Certain members of the United Society of Boilermakers and Iron and Steel Shipbuilders stopped work in Aug. 1910, in breach of an agreement with the Shipbuilding Employers' Federation, at two shipyards, one on the Tyne and the other on the Clyde; and the Employers' Federation locked out the members of the Boilermakers' Society at all the federated shipyards on Sept. 3. About 25,000 workpeople were directly or indirectly affected.

A provisional agreement made between representatives of the parties on Oct. 11 1910, was twice rejected by the workpeople on a ballot vote, and it was not until Dec. that a final agreement supplementing that of March 1909 was reached, and accepted by the workers. Work was resumed on Dec. 15. The aggregate loss of time in this dispute was about 2,850,000 working days.

A strike of *coal miners and surface workers* in the Rhondda Valley began on Sept. 1 1910 and continued for nearly a year, being settled in Aug. 1911. It arose out of a dispute at one pit concerning the price list for a particular seam, and was followed by sympathetic strikes at other pits belonging to the same employers. An agreement was finally reached on the price list, and on a guarantee of an average wage. About 12,800 men and boys were involved at the beginning of the strike.

The years 1911-2-3 were years of violent, and almost continuous industrial unrest. Among the most important disputes of these years were those described below.

A series of *seamen's and transport workers'* strikes began in June 1911. The original occasion of the first dispute was a demand put forward by the National Sailors' and Firemen's Union for the formation of a conciliation board, consisting of representatives of the Union and of the Shipping Federation, to consider a programme of reforms desired by the Union. The Federation refused to discuss the demands, and the seamen and firemen came out on strike at various dates in June 1911, many of the principal ports being affected. (London was not affected till a little later.) Strikes of dock labourers, carters, tramwaymen, and other transport workers occurred at some of these ports, partly in sympathy with the seamen, and partly in support of demands of their own for improved working conditions. Serious disorder occurred at Hull, Manchester and Salford.

Settlements were reached at various dates in July and Aug. affecting seamen and dockers at Hull and Goole; seamen and carters at Manchester; dock labourers and tramwaymen at Liverpool; and seamen and transport and other workers at Cardiff. There were also a large number of sectional settlements in the London dock, shipping, and transport trades.

The *railway* dispute of 1911 began with a strike of 1,000 railwaymen (goods porters, etc.) at Liverpool on Aug. 5, the men alleging their inability to get their grievances dealt with by the conciliation boards set up under the scheme of 1907. They were joined by railwaymen at Manchester and at many other centres. On Aug. 15 the executives of four of the railwaymen's trade unions sent to the various railway companies a resolution, stating that they were being pressed by their members to declare a strike, and giving the companies 24 hours to decide whether they would immediately meet representatives of the workers to discuss their grievances. The Government got into touch with representatives of the companies and of the trade unions on Aug. 16; and on the following day the Prime Minister announced that the Government was prepared to appoint immediately a Royal Commission, to investigate the working of the Railway Conciliation Agreement, and to report what amendments, if any, were desirable in the scheme. This announcement did not prevent a strike; but a provisional settlement was reached on Aug. 19, and work was generally resumed on Aug. 21 (except on one railway, where it was resumed on Aug. 23). The Royal Commission began its sittings on Aug. 23, and reported on Oct. 18. The trade unions, however, refused to accept the Commission's recommendations without various modifications; the railway companies, on their side, took the line that both sides were bound by the findings of the Commission. On Nov. 22 the House of Commons debated the question, and passed a resolution to the effect that the parties should be invited to meet with the view of discussing the best mode of giving effect to the report of the Royal Commission. The Board of Trade signified to the parties their readiness to call a fresh conference "on the understanding that the findings of the Royal Commission were accepted in principle and in substance." The parties accepted these conditions, and a conference was held, at which an agreement was reached, the recommendations of the Royal Commission being accepted with certain alterations and additions. The effect of the new agreement was to expedite the settlement by the conciliation boards of matters in dispute, to secure greater uniformity in the decisions of the conciliation boards, and to give such decisions greater finality than they had previously possessed.

The Cotton Weavers' Association of N. and N.E. Lancashire engaged in an active campaign in this year (1911) against the employment of non-unionists. The employers replied by a general lock-out, which began on Dec. 28, about 160,000 workpeople being involved. This is exclusive of the workpeople in the spinning section of the trade, who were put on short time, or thrown out of work, owing to the stoppage of the principal outlet for their production. The chief industrial commissioner (Sir George Askwith) invited the parties to a conference, which was duly held; and an agreement was reached on Jan. 19 1912. Work was to be resumed on Jan. 22, under the old conditions of employment, on the understanding that no action should be taken for six months in the way of tendering notices or striking mills on the non-unionist question. It was also agreed that, at the end of that period, Sir George Askwith would, if requested, submit proposals for the settlement of the question.

The great *coal* strike of 1912 involved an aggregate loss of working time of over 30,000,000 working days in the coal mines alone. There was also, of course, much consequential unemployment and under-employment in other industries. The percentage unemployed among members of trade unions rose to 11.3% at the end of March 1912; while blast furnaces, steel sheet works, and the glass bottle industry, were brought almost to a standstill, and tinplate mills working were reduced to about 14% of the normal number.

The strike arose out of a demand by the Miners' Federation for the payment of a minimum wage for every man and boy working underground in the mines. A conference between representatives of the coal-owners and of the miners had discussed the question of the earnings of miners in "abnormal" places (*i.e.* in working places where, owing to the thinness of the seams, or other causes beyond their control, the hewers were unable to earn the recognized minimum or average rate for the district), and a considerable measure of agreement had been reached; but at the annual conference of the Miners' Federation at Southport on Oct. 6 1911, it was decided "to take immediate steps to secure an individual district minimum wage for all men and boys working in mines in the area of the Federation, *without any reference to the working places being abnormal.*"

A ballot of the members of the Federation was taken on the question of handing in notices to establish the principle of an individual minimum wage, as expressed in the resolution quoted above. There was a large majority (445,801 to 115,721) in favour of giving notice; and notices were accordingly handed in, to terminate at the end of Feb.

At a subsequent meeting the Miners' Federation fixed the minimum rates they were prepared to accept in each district for piece workers "at the face" (*i.e.* hewers, etc.); and also added the following general instructions to their representatives, for their guidance in any negotiations that might ensue with the mine owners:—

> "No underground adult worker should receive a rate of wages less than 5s. per shift." (This did not apply to the Forest of Dean, or to Bristol and Somerset.) "Individual minimum wages for all piece workers other than colliers to be arranged by the districts themselves, and to be as near as possible present wages."

Day rates for underground workers, and boys' wages, were also to be left to local arrangement; the boys' wages not to be less than the then existing wages, and not in any case less than 2s. a day.

Unsuccessful negotiations took place between the coal owners and the men; and on Feb. 20 Mr. Asquith, who was at that time Prime Minister, intervened, and invited both parties to meet him and other members of the Government, separately, in conference on Feb. 22. From that date onward till March 15 the Prime Minister kept in constant touch with the parties, who finally met, in joint session, with representatives of the Government, on March 12, 13 and 14. On March 15, the Prime Minister announced that the Government had decided to ask from Parliament "a legislative declaration that a reasonable minimum wage, accompanied by adequate safeguards for the protection of the employer, should be a statutory term of the contract of employment of people who are engaged underground in coal mining."

In accordance with this announcement the Prime Minister introduced a bill in the House of Commons on March 19 1912, which received the Royal Assent on March 29, as the "Coal Mines (Minimum Wage) Act, 1912." The Act provided for the setting up of a joint district board in each of 22 districts specified in a schedule to the Act, to determine the minimum rates of wages for workmen employed underground in coal mines. On March 27 the coal owners met and adopted a resolution in favour of working the Act; and on the same day the men's Federation decided to take a ballot of the members on the question of resuming work, pending the settlement of minimum rates by the district boards. The ballot showed a majority (244,011 to 201,013) against resumption; but, at a national conference held on April 6, it was decided to terminate the strike.

A great strike of *dock and other transport workers* in the Port of London and on the Medway began on May 21 1912, and lasted over two months. The immediate occasion of the dispute was the refusal of a workman who belonged to the Amalgamated Society of Foremen Lightermen to join the Amalgamated Society of Watermen, Lightermen, and Bargemen; the latter society is affiliated to the National Transport Workers' Federation, but the former is not. The employers refused to interfere, and between 5,000 and 6,000 lightermen left work on May 21, followed later by a number of dock workers, who ceased work in sympathy.

The underlying cause of the dispute, however, was dissatisfaction with the carrying out of the various agreements that had been arrived at in settlement of the disputes in the previous year (*see* above). The Government ordered an enquiry to be held by Sir Edward Clarke, K.C.; and the alleged grievances of the workmen were found to come under seven heads, including:—

> Employment of non-union men, in alleged breach of an agreement, by two of the employers' associations.
>
> Refusal of an employers' association to meet the trade union to discuss rates of wages and conditions of labour.
>
> Refusal of certain employers to pay rates of wages fixed by various awards or agreements. Alleged interference with union workmen.

The board of trade invited representatives of the employers and of the workers to a conference, to discuss Sir E. Clarke's report. The men accepted, but the employers declined to be present, and stated that they could not accept Sir E. Clarke's report as an award on the points dealt with by him. They were unable to adopt certain suggestions made by the Board of Trade for the formation of a federation of employers; and refused, "under any circumstances, to any recognition of the Union of Transport Workers' Federation ticket, or any discussion for such recognition." Following upon debates in the House of Commons, and upon further conferences with the parties, the Government put forward various proposals on June 7; these were accepted (in substance) by the men, but refused by the employers. The Transport Workers' Federation thereupon declared a national strike of transport workers. Certain of the unions affiliated to the Federation took a ballot of their members as to the advisability of ceasing work, the result being in each case a majority against a strike; and only about 20,000 men, at Manchester and some of the minor ports, came out on strike. These all returned unconditionally after a few days' stoppage.

The places of the men on strike in London had by this time begun to be filled up by non-unionists; and the employers took a very determined attitude, refusing to agree to any conditions precedent to the men returning to work. Further negotiations were fruitless, and on July 27 the men's strike committee recommended an immediate resumption of work. By July 31 the return to work was fairly general; and by Monday, Aug. 6, practically all the men who could find work were reinstated. About 100,000 workpeople were involved in the dispute, and the aggregate duration was about 2,700,000 working days.

A strike of *tube and other metal workers* in Birmingham, Wolverhampton, Wednesbury, and other towns in the "Black Country," began on April 25 1913, and continued until the middle of July. As many as 50,000 workpeople were involved at the height of the dispute, and the aggregate duration was about 1,400,000 working days. The majority of the strikers were labourers or semi-skilled workers; but a large number of skilled men were thrown idle owing to the absence of the labourers. The men demanded an all-round advance of 2s. a week on day-rates, and 10% on piece-rates, with a standard minimum of 23s. a week for unskilled men; and various rates, on a scale rising with each year of age, for youths and for girls. The parties were brought together through the intervention of the chief industrial commissioner; and an agreement was signed on July 7, fixing the standard rate for adult able-bodied unskilled labourers at 23s. in the Birmingham district, and at 22s. in the Black Country district, to be raised to 23s. after six months. The rates for youths and for girls were also fixed, on a scale rising by ages. Piece-work rates were to be fixed by agreement between the several employers and their workmen, the day-rate, however, being guaranteed irrespective of piece-work earnings.

The Dublin dispute of 1913–4 was unique in British industrial history, in that it was the only dispute of importance, at least since regular records have been compiled, in which all the trades of a whole city and district were involved, including even agriculture. It was, in fact, the nearest approach to a "general" strike that had ever been known. Ever since the year 1908 there had been much industrial unrest in Dublin, frequently taking the form of the sympathetic strike. The "sympathetic" strike, in this developed and organized form, is a species of boycott, aiming at the complete dislocation of the trade of the firm or firms attacked; the withdrawal of their own employees is supplemented and reinforced by the refusal of the employees of other firms to handle their goods. The immediate occasion of the strike was an announcement by the Dublin Tramway Co. of the temporary closing of their parcels department, and of their intention, when that department was reopened, not to allow their employees in that department to belong to the Irish Transport and General Workers' Union, which had been active in the policy of the sympathetic strike. A number of tramwaymen struck work on Aug. 26, demanding the reinstatement of the locked-out workpeople in the parcels department; they also put in claims for increased wages, shorter hours, and other concessions. Following this came strikes (or lock-outs) of employees of flour millers, coach builders, biscuit manufacturers, coal merchants, steamship companies, master carriers, master builders, timber importers, cement and brick merchants, and farmers in the County Dublin; besides a large number of independent firms, in a wide variety of trades. At a meeting on Sept. 3, 400 employers in Dublin passed a resolution to the effect that "the position created by the Irish Transport and General Workers' Union (a union in name only) was a menace to all trade organizations, and had become intolerable"; and pledging themselves not to employ members of that Union, or any persons refusing to carry out his employer's lawful and reasonable instructions. A large number of employers endeavoured to require their workpeople to sign an undertaking in the following terms:—

> "I hereby undertake to carry out all instructions given to me by or on behalf of my employers, and, further, I agree to immediately resign my membership of the Irish Transport and General Workers' Union (if a member), and I further undertake that I will not join or in any way support this Union."

On Sept. 26 it was announced that a Court of Enquiry had been appointed, consisting of Sir George Askwith, Sir Thomas Ratcliffe Ellis, and Mr. J. R. Clynes, to inquire into the dispute, and to take such steps as might seem desirable with the view of arriving at a settlement. The Court of Enquiry heard evidence at Dublin on Sept. 29 and on Oct. 1–4, and issued their report on Oct. 6. The report (1) regretted that no steps had been taken to set up Conciliation Boards, as had been several times suggested; (2) reported that there were indications that substantial grievances existed in the various industries; (3) condemned the policy of the sympathetic strike; "no community," it declared, "could exist if resort to the sympathetic strike became the general policy of Trade Unionism"; and (4) condemned the undertaking which the employers had endeavoured to impose on the workpeople, as contrary to individual liberty, and such as no workman or body of workmen could reasonably be expected to accept. The report also made proposals for the settlement of the dispute, based on the establishment of a series of conciliation committees. These proposals were accepted by the workers but rejected by the employers, who declared that they could not recognize the Irish Transport and General Workers' Union, until it was reorganized on proper lines, with new officials approved by the British Joint Labour Board.

Various other efforts were made to settle the dispute, notably by the Joint Board (the "British Joint Labour Board," already referred to). This was a composite body representing the parliamentary committee of the Trades Union Congress, the Executive Committee of the General Federation of Trade Unions, and the Executive of the Labour party. These overtures came very near to success, the parties being brought together in joint conference; but the negotiations broke down, on Dec. 20 1913, on the question of reinstatement. All this time the employers had been gradually replacing the men on strike or locked out; and a few of the men who had struck (or been locked out) had returned to work. During Jan. and the early part of Feb., the majority of the remaining strikers whose places were still open returned to work, most of them agreeing to handle all goods and to obey orders. In some cases the men also undertook not to belong to the Transport Union.

The principal dispute of 1914 was in the London *building* trade. Numerous strikes had occurred against the employment of non-unionists, although most of the trade unions were bound by agreements which contained (*inter alia*) a stipulation that there should be no discrimination between union and non-union labour. At a conference with eight of these trade unions, held on Dec. 23 1913, the employers put forward certain proposals for enforcing these agreements by means of penalties; these proposals were rejected by the trade unions, and on Jan. 7 1914, the London Master Builders' association gave notice that they regarded the working-rule agreements as no longer in force. The employers next endeavoured to impose on the workpeople an individual undertaking to work peacefully with non-unionists, on pain of a penalty of twenty shillings. Most of the men refused to sign the undertaking, and the strike began on Jan. 26 1914. Various efforts were made to settle the dispute; but proposals which had been agreed to by the men's representatives were twice rejected by the trade unions on a ballot vote. One of the smaller unions, however, accepted the terms at the second vote, and came to a sectional agreement; and sectional agreements were afterwards made with two other trades. At this point the National Federation of Building Trade Employers resolved on a lock-out of all their employees throughout the country, if the dispute were not settled by Aug. 15. Before the threat could be carried out, however, the World War had begun; and a settlement was hastily reached, on the basis of the acceptance by the men of the terms last offered by the employers, with certain modifications. The chief points in the settlement were:—

> Employers to be at liberty to employ any man, but unions to have right of appeal against any operative who has made himself specially objectionable to his fellows. Ticket inspection granted, but not during working hours. National executives of unions to guarantee observance of rules. Six months' notice to be given for termination or modification of rules.

There was a strike of coal miners in Yorkshire, lasting from the middle of Feb. to nearly the end of April 1914, in which about 150,000 workpeople were at one time involved. The employers at certain collieries had refused to add the usual percentages to the newly established district minimum rates; and it was finally decided that a lower minimum should be fixed for certain collieries, and the percentages above standard calculated on these reduced minima.

The outbreak of the World War brought all the important current disputes to an end; and, though there were a large number of disputes in the remaining months of 1914, and indeed during the whole period of the war, most of them were quite unimportant, and were brought to a very speedy conclusion. After the passing of the first Munitions Act in 1915 many of these strikes were illegal; and, even when they were not illegal, they were sometimes unauthorized by the central executives of the respective trade unions. The fact that the dispute was illegal or unauthorized; the swift intervention of the Government, armed with emergency powers; and—perhaps more important than all these—the severe reprobation of strikes by public opinion, tended to restrict their scope and above all to shorten their duration. Hence the aggregate duration even of some of the disputes that excited most public feeling, such as the Clyde Engineering dispute of Feb. and March 1915 (about 110,000 working days) was quite trivial by comparison with the great disputes before the war.

On Feb. 4 1915, the Government appointed Sir George Askwith, Sir Francis Hopwood, and Sir George Gibb, as a "Committee on Production in Engineering and Shipbuilding Establishments," to enquire and report as to the best means of insuring that the productive power of the employees in engineering and shipbuilding establishments for Government purposes should be made fully available. The Committee recommended (*inter alia*) that industrial disputes should never be allowed to result in a stoppage of work; and that disputes which could not be settled by the ordinary means should be referred to an impartial tribunal for immediate investigation and report with a view to a settlement. The Government accepted the recommendation, and appointed the Committee on Production as the tribunal indicated.

Hence in 1915, though there were over 700 disputes, there was only one with an aggregate duration of over a million days, a coal strike in South Wales, arising out of a deadlock over a wages agreement.

There was also only one large dispute in 1916, a strike of 30,000 jute workers at Dundee, which lasted from March 24 to June 8. The workpeople claimed an advance of 15% on piece-rates of wages, but ultimately returned to work on the old terms. This year was particularly free from disputes in the coal industry, which is generally the most affected by disputes.

Several unauthorized strikes, on a fairly large scale, occurred in the *engineering* trades in 1917. These excited a great deal of public attention, both because of the vital importance of maintenance of the fullest possible engineering output during the war, and also because the strikes were openly outbreaks of revolt, not only against the restrictions imposed on industrial freedom by various statutes and regulations, but also (what was felt to be even more serious) against the authority of the trade union executives. Measured, however, by the test of aggregate duration, only one of these disputes—the engineering strike of May 1917—was of very serious importance; and, as all the disputes had many features in common, it will suffice here to give an account of the dispute in May and of another in November.

In Nov. 1916 the Government had introduced a system of "trade cards," under which certain trade unions, including the Amalgamated Society of Engineers, were permitted to issue cards to their own members, conferring (under specified conditions) protection from military service. The system was obviously open to abuse, and the Government decided to abolish it. Simultaneously they had before Parliament a new munitions bill, which, as originally drafted, proposed (*inter alia*) to make provision for "dilution" (*i.e.* the partial utilization of unskilled or semi-skilled labour on work hitherto confined exclusively to skilled men) on commercial engineering work. Previously "dilution" had been confined to Government work.

The immediate occasion of the strike was a trivial dispute at an engineering works at Rochdale, the owners of which had committed a technical offence against the Munitions Acts. They were prosecuted and fined; but the result of the prosecution was not known until after the strike had begun.

On April 29 1917 the honorary secretary of an unofficial body called "the Manchester Joint Engineering Shop Stewards' Committee" sent out a letter calling upon engineers to come out on strike at the close of work on the following day against (1) dilution on private and commercial engineering work, (2) the withdrawal of the trade cards, and (3) the new munitions bill. Most of the engineering employees in Lancashire (which is the chief centre of the textile engineering trade) came out; and also in Sheffield, Derby, Southampton, and finally London. On the other hand, Glasgow, Newcastle, Cardiff, Birmingham, and Leeds, which were mainly "munition" centres, and not likely to be affected by the new policy, remained at work.

The unofficial committee who had taken charge of the strike denounced the official executives of the trade unions in violent terms. The executives, on their side, denounced the strike, and came to an agreement with the Government for the abolition of the trade card system. The Government supported the executives, declared their determination not to recognize the rebellious shop stewards, and finally arrested eight of these. Ultimately, however, the Government was obliged to receive the shop stewards' leaders; but under the guise of "the unofficial strike committee," and accompanied by the Executive Council of the Amalgamated Society of Engineers (the principal trade union concerned). A settlement was immediately arrived at, the unofficial committee agreeing to go back to their districts and get the men back to work, and leaving the negotiations in the hands of the Executive Council of the Amalgamated Society of Engineers.

The trade card system was abolished; but later in the year the minister of Munitions announced the withdrawal of the clauses in the Munitions Bill which would have permitted dilution on private work.

The Coventry strike was also a "shop stewards" strike, Coventry being one of the centres of the Shop Stewards movement. Unrest in this town was increased by the housing conditions, which were very bad, owing to the influx of munition workers and the consequent excessive overcrowding. On Nov. 19, the toolmakers and toolsetters at one of the engineering works in Coventry adopted a "stay-in" strike, as a protest against their inadequate rates of pay (in comparison with the unskilled men whom they had to instruct), and also in support of their demand for the recognition of the shop stewards. Next day the shop stewards went in a body to interview the head of the firm; he was ready to meet them, "and not ask who they were," but this was not enough for them; they demanded to be received *as shop stewards*. The employer refused, and the shop stewards called out all the workpeople. The whole of the engineering firms at Coventry were stopped within a few days, when it was estimated that 50,000 workpeople (men and women) were out. The strike was settled on Dec. 2 1917, by four members of the Government, who interviewed representatives of the employers and of the workpeople, the latter including some shop stewards. The negotiations which followed led up to an agreement between the Engineering Employers' Federation and the trade unions which for the first time recognized shop stewards, if duly elected and officially endorsed and controlled by their trade unions.

Apart from the engineering and munition trades the most important dispute of 1917 was a strike of *colliery examiners* (overmen, firemen, and shot-firers) in South Wales for the recognition of their trade union; the other underground and surface workers, to the number of nearly 128,000, were thrown idle by the strike. After a stoppage of three days the Colliery Examiners' Trade Union was recognized, and the employers agreed to set up a joint board to decide questions relating to firemen and shot-firers.

Industrial disputes were very numerous in 1918, but the great majority involved small numbers and were of short duration. Nearly all the considerable disputes occurred in the second half of the year; the extreme seriousness of the military situation in the first half of the year exercised a restraining influence, sufficient to prevent many large movements. The only strike of any magnitude in this period was one among coal miners in the employment of a "combine" in S. Wales, who sought for recognition of a committee of their own, confined to workers in the pits of the combine.

An *engineering and munition* strike occurred at Coventry and Birmingham in July 1918, against the introduction of what was known as the "embargo." This was a prohibition by the Government of the engagement of any additional skilled men by certain firms. The prohibition applied only to a very small number of firms, but this fact was not known to the workers; indeed the existence of the embargo at all was not generally known until a notice (in misleading terms) was issued by one of the firms affected. The strike was brought to an end, after a week's stoppage, by the Government announcing that men absent from work on July 29 would have their protection certificates withdrawn.

Two strikes in the *cotton* trade occurred in this year, one in Sept. and the other in December. The first arose from a demand of the cotton spinners and piecers for unemployment pay for time lost owing to the restrictions on the working of the mills imposed by the Cotton Control Board to meet the shortage of raw material. They returned to work after a week's stoppage on the promise of an enquiry by an independent tribunal, to be appointed by the Government. The second strike was in support of a demand by the cotton spinners and piecers, and the card-room workers, for an advance of 40% on the current rates of wages (*i.e.* on the list prices, *plus* all the percentage additions already made thereto). They returned after nine days' stoppage, having obtained an advance of 50% on the standard piece-price list of wages, equivalent to about 30% on the current rates.

In this year there was also a long dispute (lasting 47 working days) between a coöperative society and the Amalgamated Union of Coöperative Employees. This union seeks to organize all classes of employees of coöperative societies, whether distributive or productive, without regard to occupation, or "craft." The coöperative society, however, demanded that its employees in printing works should belong to one or other of the "craft" unions, and not to the Amalgamated Union of Coöperative Employees. The matter was ultimately referred to arbitration, and decided in favour of the society.

The years 1919 and 1920 were years of great industrial unrest in a variety of trades. The hours of labour in the *engineering and shipbuilding trades* were reduced, as from Jan. 1 1919, from 53 or 54 to 47 per week; but many of the workers were dissatisfied, some desiring a reduction to 44 or even 40 hours, while others were aggrieved because the rates paid to piece workers and to "lieu" workers were not increased to compensate for the reduction of hours. (Time workers received the same rate of pay for the reduced hours as for the hours previously worked.) Workpeople, to the number of 150,000 in all, came out on strike in Jan. at various centres, and remained out for periods ranging from one to eight weeks. Some returned to work unconditionally; others agreed to return on the promise of a national settlement.

There was much unrest in the *coal mining* industry. One hundred and fifty thousand miners were on strike in Yorkshire in Jan. 1919, in support of a demand for a simultaneous stoppage of 20 minutes per shift for meals for surface workers; most of these were out for one or two days only. The demand was granted, for the period of Government control. The same men were on strike again in July and Aug., for an advance of 14·3% in piece-rates to compensate for the reduction in hours from eight to seven per day; after a stoppage of from 25 to 29 days they accepted the national settlement, which gave an advance of 12·2%. In March 100,000 miners in South Wales, the Midlands, and Yorkshire were on strike, and another 75,000 miners in Nottinghamshire, Derbyshire, Lancashire, and other districts were on strike in July, over the question of the miners' demands for increased wages, a reduction of hours, and the nationalization of the mines.

There was a great strike in the cotton trade, for a reduction of hours and 30% advance in wages, in June and July 1919, both the spinning and the weaving sections being affected. The advance was granted, and the hours were reduced from 55½ to 48 hours per week (instead of 46½, as asked).

The greatest *railway* strike that had ever occurred in England began at midnight on Sept. 26 1919. An agreement had been made between the Government, the Railway Executive Committee (representing the companies), and the trade unions in March 1919, providing, *inter alia*, for the determination by negotiation of new standard rates of pay for the various grades. Standard rates were agreed upon, in Aug., for drivers and motormen, firemen and assistant motormen, and engine cleaners; and in Sept. the Board of Trade forwarded to the National Union of Railwaymen their proposals for the standard rates of other grades, showing an average advance of 100% on pre-war rates, with a minimum of £2 a week. The Union rejected these proposals, claiming that the new rate should be based on the highest standard rate already existing for each grade, *plus* 33s. war wage, with a minimum of £3 a week. Failing a favourable reply by Sept. 25, they announced an immediate strike. Negotiations continued, and fresh proposals were made by the Government; but the Union did not feel justified in postponing the strike, which accordingly began, as stated, at midnight on Sept. 26. The Associated Society of Locomotive Engineers and Firemen, although not directly concerned in the dispute, supported the National Union of Railwaymen, and its members also ceased work.

On Oct. 1 a conference, arranged by the National Transport Workers' Federation (to which the railwaymen are affiliated), was attended by representatives of the Trades Union Congress Parliamentary committee, of the Labour party, and of a number of other trades besides railways. A mediating committee was appointed, and negotiations were resumed between the Government, the mediating committee, and the National Union of Railwaymen. A settlement was reached on Oct. 5, and work was resumed on the following morning.

The settlement provided for the resumption of negotiations, with the understanding that they should be completed by Dec. 31 1919; and for the stabilization of wages at their then existing level up to Sept. 30 1920 (subject to review at any time after Aug. 1 1920). It was also provided that "no adult railwayman in Great Britain shall receive less than 51s. so long as the cost of living is not less than 110% above pre-war level."

A strike of *ironmoulders, coremakers, and iron and steel dressers* began on Sept. 22 1919, and lasted until Jan. 12 1920. About 65,000 men were involved in the immediate dispute; but the shortage of castings consequent on the dispute greatly hindered the working of the engineering industry for many months.

The demands of the men were for an advance in wages of 15s. a week for journeymen and 7s. 6d. a week for apprentices. At the settlement on Jan. 12 they accepted an advance of 5s. for men over 18 years of age, the same as had been granted to men in the engineering trades in the previous November. It was also agreed that negotiations should be resumed on the questions of: (1) the general working conditions in foundries; (2) questions arising out of the introduction of the 47-hour week; (3) minimum standard rates for the various districts; and (4) the jurisdiction of the unions over apprentices, and the wages of apprentices.

A strike of all classes of workpeople in the *furnishing* trades began in the Manchester district and N. E. Lancashire on June 27 1919, in support of a demand for an advance in wages, a working week of 44 hours, and other concessions. On July 26 a lock-out was declared at High Wycombe, Birmingham, Nottingham, Bristol and other centres, to enforce the termination of the dispute. At most of the centres involved in the lock-out settlements were reached by the end of Oct., advances in wages being granted; in some cases provision was made for the discussion of proposals to introduce sectional work, piece-work, or female labour, where not formerly in operation. The original dispute was also settled at the end of Oct., various advances being granted. At High Wycombe, where the largest number of workpeople was involved, the lock-out was not brought to a close until nearly the end of Nov.; here also advances in wages, varying according to sex and standing and the class of work done, were granted.

The year 1920 was remarkable for one dispute, the national *coal strike* of Oct. and Nov., the aggregate duration of which was second only to those of the two previous great coal strikes in 1893, and in 1912; and for an unprecedented number of smaller disputes, in a great variety of trades, many of which would have ranked as "great" disputes in a normal year. There were also many minor disputes in the building and in the textile trades. The coal strike began out of a demand put forward by the Miners' Federation of Great Britain (1) for a flat-rate advance in wages of 2s. a shift for all persons of the age of 18 years or over, with corresponding advances for those under that age; and (2) for a reduction of 14s. 2d. a ton in the price of domestic coal. These demands were presented to the Controller of Coal Mines on July 15, and refused by the Government on July 26. A ballot of the Federation showed a great majority (606,782 to 238,865) in favour of a strike in support of these demands; and strike notices were handed in, in every district, to expire on Sept. 25.

Negotiations between the Government and the miners continued, in the course of which the miners dropped their demand for a reduction in the price of domestic coal. The Government, after making various alternative proposals which were not acceptable to the miners, concentrated on the policy of making any advance that might be granted bear some relation to increased output. The miners, however, still pressed for an immediate unconditional advance of 2s. The strike notices were twice postponed, at first for a week and then for another fortnight, in order to allow the negotiations to continue. At this stage the mine-owners were called into conference; and meetings between representatives of the miners and of the mine-owners took place almost daily from Sept. 25 to Oct. 2, inclusive.

During the first fortnight of Oct. a second ballot of the miners took place on certain proposals which had been formulated by the mine-owners at these conferences. These were to the effect that if, during the first fortnight of Oct. there were indications that the output of coal was at the rate of 240,000,000 tons per annum, an advance of 1s. a shift should be conceded as from Oct. 1, with an additional 6d. for each 4,000,000 tons, up to 3s. at 265,000,000 tons. The wages for the remainder of the year would be similarly regulated, and the whole scheme would come up for review at the end of December. The owners also pledged themselves to coöperate with the men in measures for increasing output. These proposals were rejected by the men, on a ballot vote, by a still larger majority (635,098 to 181,428); and work at the mines ceased on Oct. 16, except that certain men were allowed to continue at work for keeping the mines in order.

The strike was debated in the House of Commons on Oct. 19; and tentative suggestions for a settlement were made by Mr. Brace (at that time a member of the executive of the South Wales Miners' Federation), and by other members. Informal conversations, and then formal negotiations, followed between the Government and the miners' representatives, to which at a later stage the mine-owners also were called in; and an agreement was reached on Oct. 28 which the miners' representatives undertook to submit to their members, with a recommendation of acceptance "as a temporary measure." The agreement pledged the miners and the mine-owners to coöperate with the view of increasing output; also to prepare a scheme for the future regulation of wages, "having regard, among other considerations, to the profits of the industry, and to the principles upon which any surplus profits are to be dealt with." Pending the preparation of this scheme an immediate advance of 2s. a shift was to be granted to persons of 18 years of age and over, with corresponding advances to persons under that age; and from Jan. 3 1921, until the new scheme was ready, the advance would be automatically adjusted, at monthly intervals, in accordance with the surplus output in excess of 219,000,000 tons a year. The ballot upon these terms showed a small majority against acceptance (346,504 to 338,045), on a reduced total vote; but at the miners' delegate conference at which the result was announced it was decided that work should be resumed on Nov. 4, or as soon after as possible, in view of the rule of the Miners' Federation which requires a two-thirds majority for the continuance of a strike.

A strike in the *building* trade of Scotland occurred in May, June, and July 1920. During the war wages in the Scottish building trade had been regulated by awards given every four months, as in the engineering and shipbuilding trades. A claim for an advance of 6d. an hour, as from April 1 1920, came before the Industrial Court in March under this agreement, and was refused. The joiners in the west of Scotland, influenced by the high rate of wages given to joiners in the shipyards, had withdrawn from the National Agreement, and claimed the advance of 6d. independently of the other building trades operatives; and, when this award was given, they came out on strike, to the number of about ten thousand. Negotiations with the employers ensued; and at the beginning of July about a third of the operative joiners had obtained their demand for a rate of 2s. 6d. an hour. Bricklayers and masons and their labourers had also obtained an advance in the west of Scotland; but at Edinburgh and Dundee, and in Ayrshire, they were out on strike. As delay to housing schemes was feared through the strike, further conferences were held under the chairmanship of an officer of the Ministry of Labour; and an agreement was reached on July 8 giving all classes of operatives an advance for the period from July 9 to Nov. 30. The parties also agreed to meet again, to consider a scheme for levelling up rates between sections, and for the grading of districts.

Shipyards joiners and carpenters came out on strike on Dec. 1 1920, against a proposed reduction in wages of 12s. a week. (This was the first strike, on a considerable scale, against a reduction of wages since those of 1908, mentioned above.) The employers alleged that the ship-joiners had received a special additional bonus during the preceding time of pressure in the shipyards, over and above that given to other shipyard workers, because it would have been impossible otherwise to obtain the necessary labour, in view of the intense competition from the building trades; and that the exceptional circumstances which had justified the advance had now come to an end. The number involved at the end of Dec. was about ten thousand.

A strike of *piano workers* in London, to the number of about 6,500, began on April 10 and lasted for three months. The employers sought to introduce a system of payment by results, which was objected to by the workers. Work was resumed on the systems of payment existing in each factory; with a provision that a ballot vote should be taken within three months to determine the future system of payment for the entire trade.

A strike of *electricians*, which was of great importance owing to the principle involved, began on July 2 and ended on Sept. 16 1920. The members of the Electrical Trades Union came out on strike at an engineering works at Penistone (Yorks), against the employment of a foreman who was not a member of their trade union. The Engineering Employers' Federation replied by a lock-out of all members of the union employed in federated firms throughout the country. The Government appointed a Court of Enquiry, under the Industrial Courts Act, to enquire into the dispute; but the day after the Court had begun taking evidence the Electrical Trades Union notified to the Joint Industrial Council for the Electricity Supply Industry their readiness to withdraw the question of principle, *i.e.* the claim that foremen must be members of a trade union. The dispute was settled on these lines on Sept. 16, the men withdrawing their strike notices and the employers the lock-out notices. The number of men involved by the lock-out was about seven thousand.

A strike of *shirt and collar makers* in Belfast, Londonderry, Coleraine, Dublin, and other towns, began on June 12 1920, and lasted for over two months. The cutters only were directly involved, to the number of about 302; but about 17,000 other workpeople were thrown out of work. The cutters demanded higher wages, and the strike was settled by a compromise.

A strike in the spinning branch of the *cotton* trade began at Oldham on Sept. 15 1920. During the war an agreement had been made for the employment of female "creelers" (who carry away the finished yarn) to help the spinners in cases where "little piecers" (boy assistants) were not available; and it was part of the agreement that the spinners should receive extra payments, in compensation for the additional work thrown upon them when "creelers" were employed instead of "little piecers." In Sept. 1920, an agreement was signed between the master spinners and the Operative Spinners' Trade Union withdrawing, in part, these extra payments. A large number of the spinners came out on strike against this agreement, in defiance of the executive of their union. The strike began on Sept. 15, and the maximum number on strike was reached a week later, when the number was about 20,000; and about an equal number of cardroom workers and others were thrown out of work by the dispute. The men gradually went back to work on the terms of the agreement; most of them were back by Oct. 5, but the strike was not quite at an end until the end of that month.

Coal Strike of 1921. The first seven months of 1921 were notable for a rapid and continuous increase in the number of trade disputes concerning proposals for reduction of wages. The strike of shipyard joiners and carpenters against a proposed reduction of 12s. per week, which had begun on Dec. 1 1920, and came to involve directly some 10,000 workpeople, continued until Aug. 1921, when a settlement was reached on the basis of a reduction of 9s. per week, to take effect in two stages. Among other important disputes in this period was the strike in Feb. 1921 of some 5,000 nut and bolt workers in the Black Country against a proposed wage reduction, which lasted five weeks, the employers' terms being then accepted. In March 3,500 vehicle builders and 2,170 waterproof garment finishers came out on strike against proposed reductions of wages; the former dispute lasted four weeks and ended in the acceptance of a modified reduction; the latter lasted five weeks and ended in the acceptance of the reduction on condition that it should take effect in two stages. In June a national engineering strike was threatened but avoided at the last hour, while 10,000 engineering apprentices in the Manchester district struck against a proposed reduction in wages, which three weeks later was accepted. In June, also, a new wages agreement in the cotton textile industry, involving an immediate reduction of about 19% on actual wage rates, was only made after a dispute which lasted three weeks and involved some 375,000 operatives.

None of the strikes of 1921 against proposed reductions in wages compares, however, in magnitude or consequence with the great national coal strike, which began on April 1 and ended on July 1 in an agreement which was to last until Sept. 30 1922, and thereafter, until terminated by three months' notice on either side. The position at the end of the coal strike of 1920 has already been described. Briefly a temporary settlement has been made under which the wages of miners varied according to the total output of coal from the mines of Great Britain: the more the output, the higher were the wages to be received. The miners and owners were under an obligation to prepare a scheme not later than March 31 1921, for the future regulation of wages in the industry, "having regard, among other considerations, to the profits of the industry and to the principles upon which any surplus profits are to be dealt with." The industry was still under Government control, and the "control" powers of the Mines Department of the board of trade did not expire, in any event, until Aug. 31 1921.

The coal industry, however, did not escape the effects of the general industrial depression, which indeed may be dated from the coal strike of 1920. The values of exported coal fell heavily, while the demand for coal for industrial or domestic consumption at home also decreased. The output figures for each of the four months from Dec. 1920 reflect the changes in the current demand. In the five weeks ended Dec. 25 the output for Great Britain was 25,406,700 tons; while in the five weeks ended Jan. 29 1921, it was 21,803,600 tons. In the four weeks ended Jan. 29 it was 18,540,500 tons; while in the four weeks ended Feb. 26 it was 17,369,100 tons, and in the four weeks ended March 26, 16,435,200 tons. An incidental result of this decreased output was the disappearance as from Feb. 28 of the wages advances granted under the settlement of Nov. 1920. In so far as the position, as affected both by the decreased output and by the reduction in values of export coal, may be judged from the Mines Department statistics, in Feb. 1921 the average loss over the whole of the collieries of Great Britain on every ton of coal disposed of commercially was 5s. 11¾d. In two districts, namely Yorkshire, and Derby, Nottingham and Leicester, there were small credits of 3½d. and 1½d. per ton respectively; while the debit balances ranged from 4s. 0½d. per ton in Durham to 18s. 1½d. per ton in South Wales.

In these circumstances the Government decided to terminate their control of the mining industry on March 31. This was the date at which the agreed scheme for the future regulation of wages in the industry was to be ready, but it was five months earlier than the date at which decontrol had been expected. On the one hand, the fall in the price of export coal to such an extent that there was no appreciable difference between the export price and the inland price, made it no longer necessary to regulate the pit head prices and the distribution of coal, and all such regulation was withdrawn as from March 1. On the other hand, the continuance of financial control, which had been a corollary of the regulation of prices and distribution was only involving the Government in heavy financial liabilities. The Coal Mines (Decontrol) Act, 1921, "an act to curtail the duration of and amend the Coal Mines (Emergency) Act, 1920," was therefore passed. The Act received Royal Assent on March 24, and its effect was to terminate the special interest the Government had hitherto had in the Mining Industry, as regards, for example, output and prices, wages and profits. Control at that moment meant financial assistance to the industry, and the removal of that financial assistance on March 31 made the formulation of a new wages agreement a matter of imperative urgency, if the work of the mines was to be continued after decontrol.

The decision of the Government to decontrol was communicated by the president of the board of trade to the mine-owners and miners, *i.e.* the Mining Association and the Miners' Federation of Great Britain, on Feb. 23. At the time the announcement was made, the Mining Association and the Miners' Federation were in the midst of negotiations with regard to the permanent scheme for the regulation of wages, which under the agreement of Nov. 1920, they were to complete by March 31 1921. On Feb. 25 the two bodies met again, and agreement was reached upon a considerable number of important points. But on one fundamental issue it was found impossible to agree. The representatives of the Miners' Federation insisted upon the necessity of a national wages scheme, with some form of a national pool, for the industry. The representatives of the owners insisted that wages must be based upon the wage-paying capacity of the districts, national discussion being confined to the enunciation of certain general principles which might provide the districts with some uniform method of determining their wage-paying capacity.

A definite conflict of principle had thus occurred. It was clear however that no scheme designed to be permanent would be applicable without modification to the abnormal position in which the industry would find itself on decontrol on April 1. It was therefore conceivable that agreement might be reached on a temporary scheme applicable strictly to the emergency period, leaving the points of difference on the permanent scheme for further discussion. In this way the occurrence of a dispute immediately upon the cessation of control might be avoided. Following upon a joint meeting of the two sides held on March 17, the National Delegate Conference of the Miners' Federation decided to ascertain the opinion of the districts as to whether or not they were prepared to abandon temporarily the policy of a national wages board and a national pool, and to empower the national executive to proceed with the negotiations with a view to establishing a temporary agreement on a district basis. On March 24 the Conference reassembled to receive the replies of the several districts, and these indicated that a very large majority of the Federation were against the proposal to enter into any temporary agreement on a district basis. There was thus no movement towards the owners' position. Notices terminating on March 31 contracts of employment at the existing rates having already been issued by the owners, the Executive Committee of the Miners' Federation met on March 30, and sent out the following instruction to the districts:—"That all notices must take effect regardless of occupation in every mine and plant in the Miners' Federation." Practically the whole of the men ceased work in accordance with this instruction at the close of the last shift on March 31. There was, however, some divergence in the districts on the question of withdrawing the pumpmen and enginemen who were covered by the official instruction of the Federation. These men were not withdrawn in all cases.

At this stage it may be noted that there were some points of agreement between the owners and miners. The agreement of Nov. 1920, envisaged a permanent scheme for the regulation of wages which would have regard "to the profits of the industry and to the principles upon which any surplus profits are to be dealt with." Working from this basis, by the time of the joint meeting of Feb. 25, four further principles had been agreed upon as follows:—

1. Wages must conform to the capacity of the industry to pay.
2. The receipt of a standard wage should justify a corresponding minimum profit to the colliery undertakings.
3. Any surplus remaining after these, and, of course, the usual working costs, had been met, should be divided between the men and the owners in agreed proportions, the workpeople's share to be an addition to their standard wages.
4. Joint audits of the owners' books by accountants representing each side should be made to ascertain all the data necessary for the periodical determination of wages.

On all other matters arising out of the proposed permanent scheme there were differences of considerable importance between the two sides. The following account of the main differences is based upon the draft agreement approved by the Delegate Conference of the Miners' Federation of Great Britain on March 10 (*i.e.* at the first available opportunity after the joint meeting of Feb. 25), and the report of the mine owners on the situation which was submitted after approval by the Central Council of the Mining Association, to the president of the board of trade on March 25 (*i.e.* immediately after the refusal of the miners to enter upon negotiations with a view to a temporary settlement on a district basis):—

1. The miners proposed that there should be established a National Board, consisting of 16 representatives of each side, which should determine all questions of wages and profits affecting the mining industry as a whole, *i.e.* the national regulation and distribution of wages. The National Board would take over the powers and duties of the existing district conciliation boards with regard to the fixing of general rates of wages. The owners would agree to maintain in production by the means of a national profits fund all existing collieries, and all collieries developed subsequently, until such times as the National Board might decide to the contrary.

On these points, the owners' position was that the idea of a "national profits fund" was abhorrent to them, that they wished district conciliation boards to be the sole authorities for fixing wages, and that national discussions should only deal with questions of principle, so as to provide the districts with a uniform method of determining wages.

2. The miners proposed that the new standard wage should be made up by incorporating all the existing percentage additions to district basis rates with those district basis rates, special allowance being made in favour of the men who were benefitting under the flat rate minimum advance which was guaranteed with the 20% wages advances of March 1920. The owners proposed that the new standard wages should be the district basis rates, *plus* the percentage additions prevailing in July 1914, *plus* the percentage additions made consequent upon the reduction in hours from 8 to 7.

3. The miners proposed that against their standard wages should be set, as minimum profits to the owners, a sum amounting in the aggregate to 10% of the sum paid as standard wages. The owners proposed that this figure should be 17%.

4. The miners proposed that any surplus remaining after meeting standard wages, other costs and minimum profits, should be divided between miners and owners in the proportion of 100 to 10. The owners proposed that that proportion should be 80 to 20.

5. The miners proposed that their share of this surplus should be distributed by means of national uniform flat rate additions to their standard wages. The owners proposed that the miners' share of the surplus as ascertained in each district should be distributed as a percentage addition to the standard district rates.

6. Whereas the miners' proposals meant that the whole mining industry in Great Britain should be treated as one unit within which wages would be varied uniformly, the owners proposed to take as the units of uniform variation, the 25 districts among which the collieries of Great Britain are distributed by the Second Schedule of the Mining Industry Act, 1920.

With regard to the question what modifications, if any, might be introduced to meet the abnormal conditions of the period following immediately on control, the owners expressed their willingness to waive their share of the surplus in favour of the workmen, on condition that ascertainment of the proceeds of the industry in each unit should be made at monthly periods during the continuance of the concession; but they insisted that it was inevitable that wages should go down on decontrol. From the miners' point of view it was evident that the introduction of their scheme at that moment might mean the loss to the men of war wage and Sankey wage, and the miners' argument therefore was that the Government's obligation to pay war wage or Sankey award did not cease by the decision to decontrol the trade on March 31. The war wage had been given to meet the increased cost of living when the latter was only 80 per cent in excess of the pre-war figure, and (though the Government rejected this interpretation) under the terms of the award the miners claimed that the wage was liable to revision only when the cost of living fell again to that point. With regard to the Sankey wage, the argument of the miners was that the Government had accepted the Sankey Commission's recommendations for an advance in wages of 2s. per day, and if the Government now proposed that these conditions should be abandoned, it would be guilty of a breach of faith. The miners reiterated at all times from Feb. 23 to March 31 their demand that the Government should abandon its decision to decontrol the industry, or at least should continue to subsidize it during the existence of the depression from which it was suffering.

The general argument of the miners at this time was that the situation demanded a full national settlement of the wages and profits problem for the industry. The trade as a whole needed uniform peace and security, and district or local negotiations must result in strife. The workmen and their families had to live in the poor districts as well as in the rich, and for uniform expenditure of energy there should be uniform reward. This had been recognized by the Government, first by the payment of uniform war wages to meet the increased cost of living, and, secondly, by the acceptance of the decision of the Sankey Commission to raise uniformly the wages of all coal miners to meet the agreed case for a uniform advance in their standard of living. A National Wages Board, exercising the right to distribute nationally both wages and profits, need not necessarily result in a uniform profit for all undertakings, but by means of a small levy upon the total tonnage raised in every mine, money would be made available for maintaining poor collieries in production as long as their coal was in demand.

The view of the owners, on the other hand, was that the wide variations in the losses of different coalfields made anything in the nature of a national settlement of wages impossible. While there were such divergencies between district and district, each district must determine its own wages by its ability to pay, and the individual who could not pay the wages so determined must decide for himself whether to close his pits or to bear the loss. The country could not afford to keep unprofitable pits working.

From the opening of the strike on April 1, four whole months passed before an agreement between the owners and miners was reached. The first difficulty to secure a resumption of negotiations encountered was in the Government insisting that the first subject to be discussed should be the return of the safety men to the mines, while the miners held that negotiations were useless if their demands for a wages settlement along national lines, and a national profits' pool, were totally unacceptable. But the influence of the other members of the Triple Alliance secured a modification of both points of view, and joint negotiations were resumed on April 11 and 12. On April 12 the view of the Government was outlined that, while the miners' demand for a national settlement of wages might be practicable, their demand for a national pool of profits was impracticable. A pooling arrangement for the equalization of wages in the industry was declared not to be possible without the resumption of complete and permanent control by the State of the mining industry. A national settlement of wages, however, was suggested, by which the 2nd, 3rd, 4th and 5th points at issue between the owners and miners as outlined above should be determined by the joint conference, whilst subsequent differences of interpretation should be referred to a national joint committee of owners and miners. The prime minister explained the Government's proposals as regards the abnormal period following upon decontrol, as follows:—

> "If and when an arrangement had been arrived at between the coal owners and the miners as to the rate of wages to be paid in the industry, fixed upon an economic basis, the Government would be willing to give assistance, either by loan or otherwise, during a short period, in order to mitigate the rapid reduction in wages in the districts most severely affected."

These proposals were fully discussed, but the miners' officials intimated their inability to accept them or to abandon their former position, and the conference thereupon ended. This failure at once brought to a head the question whether the other two members of the Triple Alliance, namely, the National Union of Railwaymen[1] and the National Transport Workers' Federation, would take sympathetic strike action in support of the miners. A general meeting of the National Union of Railwaymen, and a full conference of the executives of unions affiliated to the National Transport Workers' Federation, were summoned, and remained in session until April 16, when the question of sympathetic action was finally settled. The mediatory efforts of the railwaymen and transport workers on April 9, which secured the resumption of negotiations between owners and miners, had been supported by a decision that a sympathetic strike should take place on the night of April 12 unless negotiations between the miners, owners and Government were reopened before that date. This strike of April 12 was avoided by the resumption of negotiations on the 11th, but on the 13th, the day after the failure of the resumed negotiations, the railwaymen and transport workers determined to strike at 10 P.M. on April 15 in support of the miners. This sympathetic strike of April 15 was avoided, however, at the last moment. In the late evening of the 14th a group of private members of the House of Commons, after hearing a statement by Mr. Evan Williams, president of the Mining Association, dealing with the effect on the miners' actual earnings of the owners' proposals, invited Mr. Frank Hodges, the secretary of the Miners' Federation, to make a similar statement on behalf of the miners. In the discussion which followed his speech, it was understood from Mr. Hodges that the miners would be prepared to discuss a temporary wages settlement, provided that a period of time were fixed for the negotiation of a permanent settlement, to contain the principles of a national pool and a national wages board. The Prime Minister was at once communicated with, and on the following morning he invited owners and miners to meet him again for a further consideration of the wages question. The executive of the Miners' Federation, to general surprise, abruptly declined this invitation, and Mr. Hodges, whose "offer" was thus ignored, tendered his resignation (though it was afterwards withdrawn). The leaders of the railwaymen and transport workers, however, in these circumstances decided not to proceed with the sympathetic strike, and a breach was created in the Triple Alliance.

The next stage in the history of the dispute was a second series of joint negotiations between owners and miners, from April 22 to 28, as a result of a further invitation from the Prime Minister. This conference produced a further set of proposals from the owners, and the first detailed proposals for a settlement made by the Government in the course of the dispute, but these were rejected on the 28th by the National Delegate Conference, on the ground that they did not concede "the fundamental principles of a National Wages Board and a National Pool." No definite progress had been made as regards the proposed establishment of a permanent scheme for the regulation of wages in the industry. The Government suggested that the period of the permanent scheme should be one year from the close of the temporary period, subject thereafter to 3 months' notice on either side. This suggestion became part of the final settlement of July 1. They declared that a national pool or levy would involve legislation and must be regarded as a political issue; but they would accept a "National Wages Board" entrusted with the tasks of drawing up a schedule of districts and determining the principles by which wages should be adjusted in the districts, as well as with the duties of interpretation. The owners also spoke at this time of "areas" rather than "districts," the "areas" being the six divisions of Great Britain, among which the 25 districts are distributed by the Second Schedule of the Mining Industry Act, 1920. On the other hand, as a result of the statements of the owners and the Government, substantial progress was made with the preparation of a detailed temporary scheme for the emergency or abnormal period. The main points of these proposals may be summarized as follows:—

---

[1] The Associated Society of Locomotive Engineers and Firemen before the close of this episode joined the other railwaymen and the transport workers in the discussions and the decisions on the question of sympathetic strike action.

1. The duration of the temporary scheme was to be three months.
2. In each of the three months, a maximum sum per shift should be fixed, and the wages of no miner should be reduced by more than that maximum sum. The maximum reduction would be expressed as a national flat rate.
3. For the first month a maximum reduction of 3s. per shift was proposed and for the second month, one of 3s. 6d.
4. The Government were prepared to make a grant of £10,000,000 as their share in the cost of the scheme, and it was suggested that a portion of this grant might be carried forward into a fourth month.
5. The owners were prepared to waive all share in the surplus in any area, if the taking of that share would have the effect of reducing the rates of wages in one month as compared with the previous month. This was an elaboration of the proposal of the owners as regards the emergency period given above, and made public on March 25.
6. The owners were also prepared to agree that, during the period of the temporary scheme, deficiencies in standard profits should not be carried forward from one accounting period to another.

The miners, however, were as much opposed to this proposed temporary scheme as to the owners' permanent scheme. They could not accept a temporary settlement which was related to district settlements; they could not accept reductions which would force their wages below the cost of living level; and they maintained their demand that the Government should render financial assistance to the industry so as to prevent this occurring. On a cost of living basis they argued that the maximum reduction in the first place should be 2s. per shift: whereas the Government proposed a first reduction of 3s. per shift.

From the close of the second series of joint negotiations on April 28, a whole month elapsed before official negotiations were resumed. A third series of negotiations was then begun on May 27, an address being made by the Prime Minister to a joint assembly of the central committee of the Mining Association and the executive committee of the Miners' Federation. Proposals for a settlement were submitted by the Government separately to the two sides on May 28, and on June 3 the observations of owners and miners on these proposals were communicated to the Prime Minister. The reply of the Miners' Federation, drawn up by their executive committee, was to the effect that in every instance the districts had rejected the proposals. On June 4 the Prime Minister announced that the Government's offer of a grant of £10,000,000, intended to mitigate the reductions in wages and allow of a gradual scaling down of wages until they reached an economic level which the industry could sustain, would be withdrawn unless a settlement were reached within 14 days. This announcement was followed by joint meetings between owners and miners on June 6, 7, 8 and 9, and on June 10 the National Delegate Conference of the Miners' Federation adopted a recommendation of their executive to refer the alternative courses of action to a ballot vote of their members. The alternatives were put to the men as follows:—

"(1) Are you in favour of fighting on for the principles of the National Wages Board and National Pool, with loss of Government subsidy of £10,000,000 for wages if no settlement by June 18 1921?
"(2) Are you in favour of accepting the Government's and owners' terms as set forth on the back of this ballot paper?"

The result of the vote was known on June 17: the first question was answered in the affirmative by 435,614 members, and the second question by 180,725. The previous decisions of the representative bodies of the Federation were thus emphatically confirmed. The Government therefore announced their withdrawal of the proposed subsidy, and the basis for a temporary settlement had for the time being disappeared.

From the point of view of the final settlement, however, this third series of negotiations was important for the modifications which were made in the owners' permanent scheme. The owners definitely adopted the Government suggestions regarding the duration of the permanent scheme and the establishment of a National Wages Board; they proposed the establishment of similarly constituted district boards to determine district questions; they accepted a proposal made by the Government that if the rates of wages as fixed under the permanent scheme did not provide a subsistence wage to low-paid day wage workers, additions in the form of allowances per shift worked should be made by the decision of the district wages boards; and they were prepared to guarantee that the miners should receive during the first year of the agreement a minimum percentage addition of 20% to the standard wage as proposed by the owners.

The final period from June 17 to July 1 was remarkable for the marked changes in the attitude of the executive of the Miners' Federation. On June 18 an invitation was issued to the executive committees of all unions affected by wages disputes to meet the miners' executive at the earliest possible date, with the object of taking joint national action with the miners to secure their several demands. The meeting was arranged for June 25. Meanwhile the annual conference of the Labour party held at Brighton on June 21–4 showed plainly that no support for extended militant action would be given by other trade unions. The projected meeting of June 25 was therefore abandoned, and the Prime Minister was again approached by the miners' executive with a view to securing a satisfactory wages settlement. Joint negotiations between miners and owners were accordingly resumed on June 27, and on the evening of that day it was reported to the Government that an agreement had been reached, upon the assumption that the Government would reopen their offer of a grant of £10,000,000 to the industry. On June 28 the Government expressed their willingness to subsidize wages as required, during the temporary period, up to a maximum of £10,000,000. The miners' executive then referred the proposed terms to their districts; and their recommendation that the terms should be accepted was indorsed at the district meetings. On July 1 the final agreement between the Miners' Federation and the Mining Association was signed, the House of Commons voting, on the same day, a subsidy in aid of wages in the form offered by the Government on June 28. Work in the coal mines throughout Great Britain was resumed as rapidly as the circumstances at each colliery permitted.

The agreement largely incorporated the terms of the interim proposals. With regard to the temporary period of three months, it was agreed that the maximum national flat-rate reductions should be 2s. per shift in the first month, 2s. 6d. in the second month, and 3s. in the third month; and that, in those districts where it was not necessary to enforce the full maximum reduction, the wages payable during the temporary period should be calculated in terms of uniform district flat-rate reductions, and not in terms of basis rates *plus* percentages. On the other hand, the Government subsidy was now a maximum sum, and any balance not issued in respect of the temporary period of three months was no longer available to ease any further reductions which might be necessary in the fourth month after the settlement. With regard to the permanent scheme the settlement provided that standard profits should be 17% of standard wages, and that 83% of the surplus proceeds should be applied to the payment of wages above the standard rates. The duration of the guarantee that the miners should receive a minimum percentage addition of 20% to the standard wages, was extended from one year to the whole period of the permanent scheme. In other respects the permanent scheme was the one first outlined by the owners before the beginning of the strike, but it included the important modifications and safeguards introduced in the course of the third series of joint negotiations.

The outbreak of the strike had led to the Government passing an Emergency Powers Act into law, to enable exceptional provision to be made for the protection of the community when "any action has been taken, or is immediately threatened by any person or body of persons, of such a nature or on so extensive a scale, as to be calculated . . . to deprive the community, or a substantial portion of the community, of the essentials of life." On March 31 a proclamation was made under this Act declaring a "state of emergency" to exist, and by successive renewals at monthly intervals the "state of emergency" was continued until the settlement of July 1. Within this general period a state of more intense emergency occurred from April 8 to June 2. During this latter period the Reserves were embodied, and in addition to the enrolment of special constables, a Defence Force was enlisted with the object of supporting the police in providing protection to volunteers who were maintaining the mines in condition, or who might be required to carry on transport work in the event of the extension of the coal strike to railway and transport services. During the state of emergency, a series of emergency regulations were in force under which the Mines Department of the board of trade controlled the supply, consumption and movement of coal, and the police authorities in the various parts of the country were endowed with special powers for the suppression of sedition.

(B) Foreign Countries

A brief account is given below of the most recent statistics of the strikes and lock-outs in the principal European countries, other than the United Kingdom, available in 1921.

France.—Detailed statistics of strikes and lock-outs for the years 1890 to 1912 and summaries for the years 1913 and 1914 had been published by the French Ministry of Labour. The following are the totals for the years 1907–14:—

Year	Number of Disputes	Number of Workpeople directly affected	Aggregate Duration in Working Days
1907	1,279	198,136	3,563,237
1908	1,104	124,248	2,307,120
1909	1,036	169,509	3,581,928
1910	1,511	290,899	4,887,837
1911	1,474	230,795	4,037,475
1912	1,120	268,230	2,335,891
1913[1]	1,073	220,448	2,223,781
1914[1]	672	160,566	2,192,078

[1] The figures for the years 1913 and 1914 relate only to strikes.

The principal groups of industries affected by the disputes were in 1907 the transport group involving 43,248 workpeople; in 1908 and 1909 the building trade group involving 56,691 and 42,658 workpeople respectively; in 1910 the transport group involving 83,025 workpeople, and the building group involving 75,695 workpeople; in 1911 the building group involving 93,660 workpeople; and in 1912 the mining and quarrying group involving 137,602.

During the years 1907 to 1912, 46% of the total number of workpeople affected were involved in disputes concerning wages, 19% in disputes concerning hours of labour, 10% in disputes concerning the employment of particular classes of persons, 11% in disputes concerning working arrangements and the remaining 14% in disputes due to other causes. The results of disputes during the period under survey were as follows: disputes involving 12% of the total number of workpeople directly affected terminated in favour of the workpeople; disputes involving 44% in favour of the employers; those involving the remaining 44% in a compromise.

Germany.—From 1899 statistics of strikes and lock-outs other than in agriculture have been published annually by the German Federal Statistical Office. The figures for the period 1907 to 1918 are summarized below:

Year	Number of Disputes	Number of Workpeople directly or indirectly affected
1907	2,512	280,016
1908	1,524	119,781
1909	1,652	130,883
1910	3,228	390,706
1911	2,798	385,216
1912	2,834	493,749
1913	2,464	323,394
1914	1,223	98,339
1915	141	15,238
1916	240	128,881
1917	562	668,032
1918	772	1,325,897

The principal groups of industries affected by disputes in 1913 were the metal and engineering group involving 81,025 workpeople, the mining and smelting group involving 78,221 workpeople, and the building trades group involving 69,899 workpeople. In 1918 the principal groups were the mining and smelting group with 336,378 workpeople involved, and the metal and engineering group with 279,921 workpeople involved.

Of the total number of disputes occurring during the period 1907–18, 52% arose on questions of wages, 16% on questions of hours, and the balance on questions of the employment of particular classes of persons, working arrangements and miscellaneous matters. During the same period 15% of the total number of disputes were settled in favour of the workpeople, and 39% in favour of the employers, while 46% were compromised.

Belgium.—Statistics of strikes and lock-outs are published by the Belgian Ministry of Industry, Labour and Supplies. The table given below shows the number of strikes and lock-outs, and the number of workpeople directly affected, in the period 1908 to 1919, with the exception of 1914 to 1918.

Year	Number of Disputes	Number of Workpeople directly affected
1908	118	17,085
1909	123	23,469
1910	110	27,257
1911	162	57,203
1912	206	63,772
1913	167	23,752
1919	372	164,030

The mining and quarrying and the textile industries accounted for 6,096 and 3,114 respectively of the workpeople affected in 1908, for 6,456 and 2,846 of the workpeople affected in 1909, for 21,103 and 2,388 in 1910, for 34,417 and 9,089 in 1911, and for 38,479 and 5,856 in 1912. In 1913 the textile industry accounted for 10,158 of workpeople affected, and in 1919 the mining and quarrying industry for 99,035 of the workpeople affected. The causes of the disputes during the period 1908–13 were mainly questions of wages, 52% of the workpeople being involved on this account. Of the total number of strikes during the same period 13% ended in favour of the workpeople, 59% ended in favour of the employers, and 28% resulted in a compromise.

Holland.—Statistics of disputes in Holland are published by the Central Statistical Bureau. The figures for the years 1907–19 are given in the table below:—

Year	Number of Disputes	Number of Workpeople directly affected	Aggregate Duration in Working Days
1907	154	15,154	4,366,691
1908	135	7,165	91,860
1909	189	8,455	272,013
1910	146	13,238	334,595
1911	217	20,005	435,992
1912	283	21,672	367,751
1913	427	30,161	787,876
1914	271	25,569	361,400
1915	269	15,179	165,247
1916	377	18,127	249,442
1917	344	31,317	526,507
1918	325	39,640	607,236
1919	649	61,667	1,051,884

During the period 1911–5 the proportion of disputes due to questions of wages was 55%; it was 58% in 1916, 55% in 1917, 57% in 1918, and 58% in 1919. The results of the disputes during the period 1910–9 were as follows:—22% ended in favour of the workpeople, 28% ended in favour of the employers; 44% were compromised; and 6% were either indeterminate or the result unknown.

Sweden.—The Swedish labour department has published statistics of strikes and lock-outs since 1903. Figures for 1908 to 1919 are shown below:—

Year	Number of Disputes	Number of Work-people directly affected
1908 . . .	302	40,357
1909 . . .	138	301,749
1910 . . .	76	3,671
1911 . . .	98	20,576
1912 . . .	116	9,980
1913 . . .	119	9,591
1914 . . .	115	14,385
1915 . . .	86	5,119
1916 . . .	227	20,711
1917 . . .	475	46,701
1918 . . .	708	61,223
1919 . . .	440	81,041

Of the disputes recorded during the period 1910–9, 63 % were caused by questions of wages. In the same period 28 % of the disputes were settled in favour of the workpeople, 28 % in favour of the employers, and 42 % were compromised.

Spain.—Statistics of strikes are published annually by the Spanish Institute of Social Reforms. The figures for 1905–18 are given below:—

Year	Number of Strikes	Number of Work-people directly affected
1905 . . .	130	20,176
1906 . . .	122	24,394
1907 . . .	118	12,671
1908 . . .	127	12,748
1909 . . .	78	6,683
1910 . . .	151	35,897
1911 . . .	118	22,154
1912 . . .	169	36,306
1913 . . .	201	84,316
1914 . . .	140	49,267
1915 . . .	91	30,591
1916 . . .	178	96,882
1917 . . .	176	71,440
1918 . . .	256	109,168

Questions of wages were the main causes of 48 % of the strikes during the period 1910–8. In the same period 32 % of the strikes terminated in favour of the workpeople, 34 % in favour of the employers and 34 % were compromised. In 1918, 29 % of the workpeople directly affected were employed in agriculture and cattle breeding, 11 % in the textile industry, 10 % in the mining industry, and 9 % in both metal and engineering and clothing trades.

(C) British Dominions

Canada.—Statistics of disputes are published by the Department of Labour. The following table shows the number of disputes, the number of workpeople involved and the aggregate duration in working days during the years 1908–19:—

Year	Number of Disputes	Number of Workpeople directly or indirectly affected	Aggregate Duration in Working Days
1908	68	25,293	708,285
1909	69	17,332	871,845
1910	84	21,280	718,635
1911	99	30,094	2,046,650
1912	150	40,511	1,099,208
1913	113	39,536	1,287,678
1914	44	8,678	430,054
1915	73	9,140	106,149
1916	75	21,157	208,277
1917	148	48,392	1,134,970
1918	196	68,489	763,241
1919	298	133,988	3,942,189

Of the 449 disputes recorded during the period 1911–5, 128 occurred in the building trades, 103 in the metal trades, 51 in the clothing trades, 39 in the general transport trades and 29 in the mining industry. The majority of the disputes during the same period were due to questions of wages and hours, about 70 % of the disputes being due to this cause. With regard to the results of the disputes during this period 139 or 30 % resulted in favour of the workpeople, 164 or 36 % in favour of the employers, 79 or 17 % were compromised and in the remaining 67 cases the result was indefinite.

In 1919 the industry most affected by disputes was the metal and engineering, in which there were 45 strikes, involving 70,268 workpeople and a time loss of 1,993,704 working days. Forty strikes, involving 10,779 workpeople and resulting in a loss of 287,146 working days, occurred in the building trades. Of the 298 disputes recorded in 1919, 223 were due to wages. In the same year 157 of the disputes terminated in favour of the workpeople, 88 in favour of the employers and 23 were compromised.

Australia.—The systematic collection of statistical data regarding strikes and lock-outs in Australia was initiated by the Commonwealth Bureau of Census and Statistics at the beginning of 1913.

The following table shows the number of strikes and the number of workpeople directly and indirectly affected in the years 1913–9:—

Year	Number of Disputes	Number of Work-people affected
1913 . . .	208	50,283
1914 . . .	337	71,049
1915 . . .	358	81,292
1916 . . .	508	170,683
1917 . . .	444	173,970
1918 . . .	298	56,439
1919 . . .	460	157,591

In 1919 the total number of working days lost on account of strikes and lock-outs was 5,652,726. (J. H.)

(D) United States

In Nov. 1909, more than 25,000 shirt-waist makers struck in New York City; in July 1910 the cloak and suit makers in the same city; and in Oct. the men's clothing workers in Chicago. These strikes were remarkable for the numbers involved, and for the plans of adjusting grievances which resulted.

The joint agreement of the bituminous mine operators with the United Mine Workers expired April 1 1910. Disagreements as to district boundaries prevented its renewal without friction. On April 1 about 300,000 miners struck. In most districts the operators soon granted the wages increases demanded. Some 45,000 miners remained out. In July the union concluded an agreement with the remaining operators, only to have it rejected by referendum of the strikers. The miners returned to work in Sept.; the union had paid out $674,216 in strike benefits. The same year, in Columbus, O., the street-railway employees struck three times, in April, May and July, because of discharges of union members. The state Board of Arbitration considered the company responsible. The strikes were marked by violence; much of the company's property was destroyed and a number of lives were lost. Twice the militia were used to restore order.

In 1912 there were strikes led by the Industrial Workers of the World among the silk workers of New Jersey, the lumbermen in Louisiana, and the textile workers in Lawrence, Mass. (*See* Trade Unions.) The Lawrence strike lasted for nine weeks and affected 12 mills. On Jan. 11 about 14,000 employees walked out, and during the strike the number increased to 23,000. The cause of the strike was the announcement by mill owners, when the state law went into effect limiting the hours of women and children to 54 a week, that the reduction in hours would not be accompanied by an increase in the hourly rates of pay. At the beginning of the strike only a small number of the operatives were organized; the paid-up membership of the I.W.W. in Lawrence was not more than 300. During the strike the I.W.W. claimed 14,000 members; but the next year the membership had dwindled to one-half. Violent acts by strikers, greatly exaggerated by the press, and violent acts by deputies, police and militia, scarcely mentioned by the press, embittered the struggle. Early in the strike Haywood, Ettor and Giovannitti, I.W.W. organizers, went to Lawrence. Their coming resulted in a reduction of violence, for they preached passive resistance; however, threats to prevent strikebreakers from working probably continued. A business man of Lawrence, not connected with the strikers, was arrested and fined for placing sticks of dynamite in various parts of the town, presumably to discredit the strikers. The American Federation of Labor contributed $11,000 to the strike relief fund, the Socialists $40,000 and the I.W.W. $16,000. Two hundred children of the strikers were sent to New York to be fed by other workers in order that their parents might hold out longer. Ettor and Giovannitti were arrested in connexion with the murder of a woman, and used their trial for propaganda. The I.W.W. urged a general boycott of Lawrence. As a result of the strike 30,000 employees received wages increases of from 5 %

to 20%, and an increased rate for overtime. The largest increases were given to the unskilled workers.

The anthracite coal strike, beginning March 31 1912 lasted seven weeks. About 170,000 men and boys were out. The results were wages increases, abolition of the sliding scale and provision for a grievance committee. A strike of the coal-miners of Paint Creek and Cabin Creek in W. Virginia lasted from April 1912 to July 1913, and was marked by violence and lawlessness. Thirteen lives were lost. It has been estimated that the employers lost $2,000,000 because of the strike, the strikers $1,500,000 in wages and that the strike cost the taxpayers of the state or county $500,000. Miners in other states contributed $602,000 to the strike fund. The U.S. Senate ordered an investigation.

In 1913 business was active, the cost of living was rising, and there were many strikes. A strike of silk workers in Paterson, N.J., beginning in Feb. involved 293 establishments and over 25,000 workers. The strike was in protest against the introduction of the three- and four-loom system, and to enforce shorter hours and increased wages. After the strike began, the I.W.W. sent in their leaders. They succeeded in holding the workers together during the five months of the strike. The attempt by the American Federation of Labor to organize the workers and effect trade agreements with the employers failed. The strike was lost through exhaustion of the workers. A strike in the copper mines of upper Michigan, for recognition of the Western Federation of Miners and to compel the enforcement of certain state laws, began in the summer of 1913 and lasted until April 1914. The men were taken back with the promise of wages increases and reduction of hours, but on condition that they give up membership in the union.

In Sept. 1913 a strike broke out among the employees of the Colorado Fuel and Iron Co. for recognition of the United Mine Workers' Union, wages increases and the enforcement of state mining laws. In Dec. a Federal grand jury indicted many of the union officials for violating the anti-trust Act by trying to create a monopoly of labour. Mine operators were also indicted for violating state mining laws. In Jan. 1914 the Federal House of Representatives ordered an investigation. Early in the strike the state militia had been sent in and martial law declared. Both sides were guilty of violence. The strikers had moved from the houses owned by the company to tent colonies on land leased by the union. One of the largest of these was at Ludlow. On April 20 1914 militia fired into the tents, which were ignited, and 7 men, 2 women and 11 children perished. Each side accused the other of initiating the attack. John D. Rockefeller, Jr., on behalf of the employing company, refused to go to arbitration with the union, which he believed to be controlled by eastern agitators. President Wilson then sent 2,000 Federal troops to restore peace. They took the place of the militia, who withdrew, and disarmed the strikers and mine guards and deported the strikebreakers. In Sept. President Wilson proposed that the company should take back the strikers not guilty of violence and establish grievance committees and a committee of appeals to effect arbitration. The proposal was accepted by the miners but rejected by the operators. Early in Dec. 1914 the President appointed a commission to settle future disputes in the Colorado mines, made up of representatives of the employers, the union and the public. The union then voted to call off the strike and on Dec. 30 part of the Federal troops were withdrawn. At no time during the strike did the directors of the company visit the property, but after investigation by the U.S. Commission on Industrial Relations, John D. Rockefeller, Jr., visited Colorado. The result was the introduction of a system of employee representation. The miners voted to accept the plan, which provides for annual election, by the workers in each camp, of representatives to meet in conference with the employers' representatives. Each district conference names committees on conciliation, safety, sanitation, health and housing, education and recreation. A supervisor of welfare work was appointed. The workers were granted the basic 8-hour day and check-weighmen. A promise was given that union men would not be discriminated against, but the union was not recognized.

A lock-out of 16,000 coal-miners in Ohio which lasted more than a year was settled in May 1915, by Federal mediation. For a year after the war broke out in Europe, business was depressed in the United States, and many workers were competing for employment; but with increasing demand for labour on war contracts strikes again became numerous. In 1915 there were 102 strikes and 6 lock-outs of machinists in the four months July to Oct.; in nearly every case the basic 8-hour day was gained. In 1916 there was rioting in connexion with strikes in the oil refineries at Bayonne, N.J., of iron and steel workers in East Youngstown, O., and of 30,000 workers of the Westinghouse Electric Co. in Pittsburgh. Unorganized iron miners on the Mesaba range in Michigan were on strike from June to October. In the same year there were also strikes of longshoremen on the Pacific coast, and street railway employees in several cities. Coal strikes affected 350,000 men. Some 10% of the strikes that year were in New York City where more than 300,000 workers were out, chiefly in the garment trades.

After the United States entered the war the American Federation of Labor discouraged strikes in essential industries. Disputes were settled by negotiation. A number of strikes did occur, however, in some cases involving large numbers of workers; the great majority were settled by Government committees. Those responsible for war labour administration were of the opinion that the period of the war should be one of truce in the industrial field. Demands for closed shop or for radical social change were barred. The truce was not always respected by workers or employers, but on the whole it was adhered to. Local machinists' unions in Bridgeport and Newark came under radical socialist leadership. As many of the Allies' war orders were placed in Bridgeport there was great demand for machinists and the town became overcrowded. The men were dissatisfied because their pay was lower than that of men in the shipbuilding yards, and because employers discriminated against the unions. In the summer of 1917 the men demanded the 8-hour day, 10% increase in wages with certain minimum rates of pay for each class of workers, right of union membership and shop committees for the adjustment of grievances. The answer of the employers was to ask the U.S. attorney-general for criminal action. Various Federal agents were sent to Bridgeport but were unsuccessful in preventing the strike which occurred in May 1918. The strikers, however, were persuaded by the Federal mediator to return to work. Hearings were held in Washington before a special board of the Ordnance Department, and on June 8 the award was made public. After some protest the workers accepted it, but the employers refused, with the result that the men again went out on strike June 26. The War Labor Board took up the matter, but unsuccessfully, an umpire was appointed, who granted the 8-hour day, arrangements for collective bargaining, and wages increases for the most poorly paid workers; but not classification of workers with minimum wage rates. The men felt that the Government should have sustained its earlier award, and they refused to accept the second, which seemed to them to be a compromise with the employers. A third time they went out on strike. President Wilson then wrote to the strikers threatening that unless they returned to work immediately, they would be refused employment in any war industry in their community, they might not claim draft exemption on the grounds of employment in an essential industry, and that the U.S. Employment Service would refuse to find them work in other localities. On Sept. 17 1918 the men voted to return to work. The President also required the employers to reinstate all strikers. The collective bargaining machinery provided by the award never functioned.

In the summer of 1917 the entire lumber industry of the north-west was disorganized by strikes. The chief demand was for the 8-hour day. The President's Mediation Commission was unsuccessful in its attempt to settle the difficulties. The employers continued the 10-hour day, but they had difficulty in keeping men, and those who did accept employment practised sabotage. In the shipyards workers refused to handle "10-hour lumber." These conditions continued until Col. Brice P. Disque, sent into the field by the "spruce division" of the War Department, effected the organization of the Loyal Legion of Loggers and Lumbermen made up of both employers and employees and with the aim of improving conditions by mutual agreement. Members signed a pledge of loyalty to the U.S. Government. On March 1 1918 the employers introduced the 8-hour day without reduction of wages. A sanitary survey of the camps was instituted, and other improvements in living conditions were made. Labour turnover decreased and output increased considerably. Although at first it had aroused suspicion, the organization won support of most of the employers and men, but both A. F. of L. unions and I.W.W. continued to oppose it.

In many places the public, in sympathy with the employing interest and angered by the philosophy of the I.W.W., attempted to prevent strikes by arresting labour organizers as these came into a locality. Some were thrown into jail and sometimes kept there for long periods without trial. Among the strikes in connexion with which violence occurred were those of the miners in Arizona, in 1917, who struck near Jerome (May) and Bisbee (June) and also in two other districts. The chief demands were for higher wages and grievance committees. Mine owners charged the I.W.W. as responsible, although an A. F. of L. international union was actually in charge of the strike. About 100 miners were deported from Jerome by the employing interests, in cattle-cars. The train was turned back at the California state line, and the men were kept in jail for three months. On July 12 1917 in Bisbee, 1,200 strikers were dragged from their beds by armed citizens, compelled to march, and then confined in a ball-field and loaded on cattle-cars. The train was sent through the desert until taken over by soldiers camped at Columbus, N.M. Here they lived on army rations for three months, and then scattered. One-third of these men were members of the I.W.W. In July 1919 county officials arrested 107 men, prominent citizens of Bisbee, charged with kidnapping and assault, in connexion with the deportations of two years before. Civil suits for damages were filed against mining companies and the railways by the men who had been deported; these were settled out of court.

In the six months following America's entrance into the war 3,000 strikes were reported; in the first six months of 1918 the number was 1,771. When the Armistice was signed, the War Labor Board had on hand several hundred cases awaiting hearings. Now that the national emergency had passed, many employers and employees ceased to coöperate. Strikes began again. As in 1916 and 1917, the greatest number of strikes in 1918 and 1919 were in the metal trades, building, clothing, textile, transportation and mining. The largest number of workers in any one strike in 1916 was 60,000, in the men's clothing strike in New York; in 1917 no strike involved as many as 40,000; in 1918, 60,000 machinists were on strike in northern New Jersey. The strikes of 1919 were remarkable for the number of workers included; the total number was reported to the Bureau of Labor Statistics as 4,112,507. Not many strikebreakers were employed; the labour reserve was still depleted owing to business prosperity of the war period. Many of the larger strikes occurred in New York City and its vicinity; 176,000 struck in the clothing trades; 150,000 textile workers in New Jersey and New England; 16,000 marine workers struck in New York harbour in Jan.; 17,000 in March; and 20,000 longshoremen in March. In July 40,000 marine workers of the Atlantic coast struck; 100,000 were out sometime during the year. In 1919, also, 65,000 struck in the stockyards in Chicago; 100,000 in the shipyards of New York and vicinity; 151,000 in the New York building trades; 43,000 anthracite miners in Pennsylvania.

After the Armistice, war labour adjustment boards, one after another, were dissolved. Workers who had been prevented from striking by the promise of peaceful settlement of grievances, felt that the Government and employers had broken faith. The result was widespread unrest, and a number of spontaneous strikes by the rank and file of union membership, not authorized by the union officials. Demands both for the closed shop, and for the open shop were pushed without thought of compromise. Employers discriminated against union men, and recourse was had to force. In accordance with a resolution of the convention of the A. F. of L. in June 1918, the 24 international unions which claimed jurisdiction over the trades in the steel industry coöperated to organize all the workers in that industry. Mass meetings were held in Sept. in mill towns. The companies replied by discharging union members; the U.S. Steel Corp. ignored the request of President Gompers of the A. F. of L. for a conference. On July 20 1919 the committee of the 24 unions decided to submit a strike vote to their membership. Twelve demands were made. The real issue was recognition of the union. Wages in the industry were high, but the hours long. In 1911 the stockholders of the Steel Corp. had ordered an investigation of conditions of work. The report showed that 50% to 60% of the employees in rolling-mills, open hearth and blast furnaces worked a 12-hour day. The committee recommended a reduction in hours, but the recommendation was quashed by the finance committee. In Sept. 1918 the basic 8-hour day was granted, which resulted in increased pay, not shorter hours. The communities in which steel workers lived were ruled politically by company influence. In W. Pennsylvania organizers were denied free speech and assemblage by local authorities. The unions voted to strike. The call to strike on Sept. 22 1919 was published in seven languages, to all workers in iron and steel mills and blast furnaces not bound by trade agreements. The companies prepared for battle. At McKeesport alone 3,000 citizens were sworn in as special police subject to instant call. The mills of the Pittsburgh district were fortified and provisioned. On Sept. 21 rioting and arrests began. The next day 365,000 men stayed away from work. The state constabulary were sent in. Gradually the men went back to work. On Jan. 8 1920 the national committee for organizing the workers permitted the 100,000 men still out to return to the mills. Those who were taken back were required to give up their union cards. The national committee reported that 156,702 union members paid initiation fees between Aug. 1 1918 and June 31 1920, and estimated at 250,000 the total number organized.

February 6 to 11 1919 there was a general strike in Seattle Wash., involving 60,000 persons, in sympathy with shipyard employees who were striking for an increase in pay. The general strike was carried out by craft unions of the A. F. of L., although I.W.W. propaganda in the interest of industrial solidarity may have helped to put the workers into the spirit for such a mass demonstration. On the first day 110 unions stayed out; some workers had permits from the strike committee to work in the interests of public health and safety; garbage was collected and milk was delivered to distributing stations. A Labour guard patrolled the streets to preserve order. The business men viewed the strike as a "revolution." The mayor announced that unless the strike were called off on the morning of Feb. 8, he would declare the city under martial law. This threat was not carried out, although citizens armed themselves, and the governor sent troops and machine-guns. On Feb. 11 the strike was called off. Workers had been returning, indeed, since the second day and a month later all were back, without wages increases.

The New York harbour strike of Jan. 1919 arose spontaneously as the result of local initiative and comprised practically all the 16,000 or 17,000 men employed on harbour craft. As a result 50,000 longshoremen also were idle. The harbour had been the scene of industrial dispute since 1917. The immediate cause of the 1919 strike was the refusal of the employers to appear for arbitration before the War Labor Board to which the men had appealed for the 8-hour day and increased pay. The employers were persuaded by President Wilson to accept arbitration, and the men returned to work. The award did not provide for the 8-hour day, and the men struck again. The Railroad Administration then made concessions to the men on boats, and they returned to work. Other Government employees followed, and by April the private employers settled for the original 10-hour day but with wages increases. On Oct. 7 the railway men struck again. The longshoremen joined them, against the orders of their national officials. They wanted increased pay; the strike dwindled away and was over by November.

In Aug. 1919, although forbidden by their national officers, the railway shopmen called a strike because of the delay of the Wage Adjustment Board to reach a decision on the demands of the men for increased pay. The strike began in Chicago and spread to New York and Boston; 250,000 men went out. After six days the strike was called off and the men returned to work. At the request of President Wilson the demands for wages increases were postponed. Other strikes not authorized by national officers of the union were those of employees of the General Electric Company in four cities in 1918 and of the New York local of the International Typographical Union in 1919. For 1917, 72 "unauthorized strikes" were reported, 58 for 1918, and 125 for 1919. Those in 1919 involved 1,053,256 strikers.

In Nov. 1919 435,000 bituminous coal-miners struck for wages increases of 60%. They also demanded the 6-hour day, and the 5-day week in order to distribute the work through the year. The miners at first refused to arbitrate the dispute as they feared the delay would give advantage to the employers. An injunction was issued to prevent the use of union funds for strike benefits. An award of an impartial committee was accepted in March 1920, which granted an average of 27% increase in wages, but the 8-hour day was retained.

About 93% of the policemen of Boston struck in Sept. 1919 for the right to organize and affiliate with the American Federation of Labor. The city was subject to rioting and crime until the National Guard restored order. President Wilson declared a police strike to be a crime against civilization. The police commissioner filled the places of the strikers with other men. In Aug. 1919 there was also an actors' strike, in which the stage hands and musicians joined in sympathy. An "outlaw" strike on the railways in April 1920, due to the delay of the President in appointing the Labor Board provided by the Transportation Act, was opposed by the brotherhoods. In 1919 and 1920 there were strikes on the Brooklyn Rapid Transit road, and in 1919 also on the Interborough Rapid Transit of New York.

A strike and lock-out in the men's clothing industry in New York of six months' duration was settled June 2 1921. The settlement may be regarded as a victory for the union, and for the principle of trade agreements. Since Sept. 1920 negotiations had been carried on between the employers' association and the union. Business depression gave an advantage to the employers, for whom a lock-out would not mean such a loss as if it had come a year earlier. On Dec. 2 the employers presented an ultimatum to the union stating that unless piece work, a reduction in wages and the employer's full control of employment and discharge were accepted before Dec. 6 the manufacturers would put their own programme into effect, regardless of the decision of the impartial board. The union rejected the ultimatum. The reply of the employers was an announcement that the impartial machinery had ceased to function. Stoppages of work by employees and lay-offs and shut-downs by employers followed. By Dec. 13 the union instituted picketing. An offer of mediation by the state Industrial Commission was accepted by the union, but rejected by the manufacturers. The manufacturers' association resigned from the national federation. In Jan. 1921 one of the employers began suit for an injunction against picketing, $500,000 damages, and dissolution of the union because of its alleged revolutionary character. The suit for dissolution was dismissed on March 29. By March 27, 425 shops had reopened under agreements with the union, so that 25,000 of the 60,000 clothing workers were again at work. On April 5 the union announced that $1,000,000 had been raised toward their defense fund. Early in May certain of the employers resigned from the association, and the remainder reached an agreement with the union, by which the bargaining machinery with the impartial chairman was reinstated. The workers accepted a 15% cut in wages. The union brought suit for $1,000,000 damages against the employers on the charge of attempted boycott of union members.

STRYPA-CZERNOWITZ, BATTLE OF.—The fighting in the area between the River Strypa and Czernowitz (the capital of the Bukovina) in the winter of 1915–6 comprised an important series of operations on the eastern front between Russia and the Central Powers.

In the middle of Nov. 1915 the fighting activity in the Russian theatre of war had died down (*see* Eastern European Front Campaigns). Both for Austria-Hungary and for Germany the war against Russia became of secondary importance in proportion as the war of annihilation against Serbia progressed. The Central Powers had for the moment no offensive in view against Russia, who was exhausted after the heavy fighting which had gone before. Both belligerents now settled down to a war of position, which enabled them to restore their armies. This lasted until Christmas.

In the middle of Dec., Ivanov, who was in command of the Russian S.W. front, prepared for a new great offensive. This was, no doubt, with the view of raising their fallen prestige and regaining the confidence of the wavering Balkan States; above all to relieve Montenegro, whose overthrow by Austria-Hungary was imminent; and not least to serving the advantage which a Russian victory would have in influencing Rumania, which was still vacillating, to join in against the Central Powers.

Three Russian armies—the VIII. under Brussilov, the XI. under Shtcherbachev and the IX. under Lechitski, with 32 infantry and 13 cavalry divisions as well as some *Reichswehr* formations—attacked the Austro-German front S. of the Polesic in E. Galicia and in the Bukovina. From N. to S. there stood opposed to the Russians the main body of Linsingen's group of armies, Böhm's group of armies and Bothmer's and Pflanzer-Baltin's armies, counting roughly 40 infantry and 13 cavalry divisions. The approximate strength expressed in rifles was in the proportion of 450,000 Austro-Hungarian to 480,000 Russian. The Austro-Hungarian infantry divisions were on a lower establishment than the Russian.

Whereas on the N. wing and in the centre no particular actions took place, the main attack, assigned by Ivanov to Lechitski's and Shtcherbachev's armies, was delivered against Pflanzer and Bothmer on a front stretching from the Rumanian frontier to Burkanów on the Strypa. The main burden of the attack fell on Pflanzer-Baltin's army, which was fighting with 8 infantry and 5 cavalry divisions against the Russians' 10 infantry and 6 cavalry divisions.

Not without reason had the Russians selected the S. wing as the point of attack. A success which should give them back the capital of Bukovina could not have failed in its effect on Rumania. And besides, an advance into Bukovina was the shortest cut to the Carpathians, the reacquisition of which was among their most cherished ambitions. They hoped, by defeating Pflanzer's army, to roll up Bothmer's and Böhm's fronts.

The preparations for the attack on the Bessarabian front had been evident since the middle of December. Lechitski had during that month assembled 4 corps in front of Pflanzer's S. wing between the Pruth and the Dniester. A sharp watch was kept on this section by the XI. Corps under von Korda, general of infantry, with 3 infantry divisions and 1 of cavalry. Pflanzer was prudently preparing for the anticipated attacks by organizing the positions so strongly as to compensate for the deficiency in numbers. Reinforcements did not arrive until later.

On Dec. 23 an attack on Papp's brigade was repulsed with heavy Russian losses. In the following days small enemy attacks multiplied themselves at numerous points of the front. On the 26th heavy artillery fire began, and on the morning of the 27th, heralded by a heavy bombardment from at least 200 guns, the Russian mass attack was launched on the Bessarabian frontier and to the N.E. of Zaleszczyki, having as its centre of gravity the positions N. of Toporowce. In the afternoon also the Russians flung themselves six times on the Austro-Hungarian positions, 15 or 16 rows deep, but in vain. They were driven back with heavy losses either by artillery fire or in hand-to-hand fighting.

On the 28th they repeated their ruthless attacks, which, as at Toporowce and Bojan, became exceedingly violent. The S. wing of the S. army was attacked on the same day by the Russian XI. Army, now commanded by Gen. Sakharov in place of Shtcherbachev. At Burkanów an Austro-Hungarian outpost on the Mogila height had to be brought back to the main position. On the 29th the battle reached its height. Not only the XI. Corps but also the VI. Corps and the 36th Inf. Div., defending the heights on the E. bank of the Strypa, were furiously attacked.

The Russians had brought up fresh forces from Odessa and Kherson for the attack on the N. wing of Pflanzer's army. The Russian VII. Army, with 5 to 6 divisions of the Caucasian V. Corps and the II. Army Corps, pushed in between Lechitski's and Sakharov's armies, and in addition the II. Cav. Corps came over from Lechitski's S. wing. Considerably reinforced by these new forces, Ivanov continued to bring fresh masses into the attack on the Austro-Hungarian VI. Corps and the 36th Inf. Div. But as on the previous days all these attacks, courageous as they were, broke down. Sakharov's S. wing met with the same fate in attacking the Burkanów bridge-head. Here the 132nd Inf. Bde. of Hoffmann's Corps heroically repulsed one onslaught after another and brought 900 prisoners behind the lines, leaving as many Russian corpses in front of the obstacles.

On the 30th and 31st the Russians, after hours of preliminary bombardment, renewed their attempts to break through opposite the VI. Corps. But Arz, reinforced by the 38th Honved Inf. Div. which had been brought up from the S. army, repulsed all the assaults. On the 31st the Russians, having had no success, and considerably weakened by their enormous losses, withdrew in the evening. On the Dniester front and the Bessarabian frontier they confined themselves on both days to moderate artillery fire, being greatly exhausted by the preceding days. On the II., I. and IV. Army fronts also, only artillery duels took place.

On New Year's eve and the morning of Jan. 1 1916 the attacks on Pflanzer's S. wing in Bessarabia increased in intensity. But Korda repulsed all the Russian IX. Corps attacks in hand-to-hand fighting, with the help of the 9th Inf. Bde., which had come up from the Italian theatre. In the afternoon 6 Russian infantry regiments returned to the assault at Rarancze, and succeeded in forcing back the Austro-Hungarian position by about 300 paces on a breadth of 1,200 paces. A counter-attack was at once put in hand, but could not penetrate owing to renewed Russian attacks. Arz's and Bothmer's S. wing, which was attacked by the Russian XXII. Corps at Sokolov, repulsed all attacks on New Year's day.

On the 2nd the Russians repeated their efforts to break through at Rarancze, but failed in each case. But in view of the Russians' superior numbers, the Austro-Hungarian higher command renounced the idea of winning back the lost position.

On the 3rd and 4th the battle burst forth again on the Dniester front. At Toporowce and Rarancze furious fighting again took place. But the Russians' efforts remained fruitless, their attacks being frustrated by the striking bravery of the defenders in close fighting. Here the brave Croats of the 16th Inf. Reg. played a most glorious part. At Ocna, too, and at the bridge-head of Michalcze, N.W. of Uscieczko, the front and flanks of which were already surrounded by the Russians, all attacks were untiringly repulsed. On the 5th, after these assaults, a short lull set in once more in E. Galicia and on the Bessarabian frontier.

On Jan. 7, the Russian Christmas Day, which was also the opening day of the attack on Montenegro, the Russian storm-masses again attacked the VII. Army. At Dobropole a counter-attack by the 12th Inf. Div. drove the troops of the 3rd Turkestan Div. out of a captured line of trenches. At 11 A.M. the Russians opened a heavy bombardment on the Korda's XI. Corps, following it up at one o'clock with an infantry attack on the Toporoutz and Rarancze positions. But this again brought no success.

On the 8th, 9th and 10th, it seemed as if the Russians had again to pause and take breath. Austro-Hungarian airmen reported the approach of new Russian reinforcements opposite the N. wing of Pflanzer's army. On all these three days, however, the Russians continued to fire on the positions. On the 10th the firing at Toporowce and Rarancze became considerably more vigorous, and when it reached its greatest intensity on the 11th, and finally resolved itself into a bombardment, Korda again prepared for a most determined resistance. From three o'clock in the afternoon until ten in the evening, the Russian masses stormed the Austro-Hungarian positions unceasingly in the attempt to break through. But each new attack ended in a precipitate retreat, thanks to the excellent artillery defence.

Pflanzer's front had meanwhile been reinforced by the 40th Honved Inf. Div., the 2nd Cav. Div. and the 24th Inf. Division.

It was not until the 13th that the Russians girded themselves for a fresh attack. With their divisions filled by fresh troops, they launched against Korda's positions eight violent assaults before the evening of the 14th, but were obliged to retire each time with heavy losses. This was their last effort. Their strength seemed broken, and on the 15th, except for some firing on the positions, there was peace.

The failure of the Russian attacks, and the cessation of hostilities against Montenegro which followed on the 17th, indicated the close of the New Year's battle. There were still a few isolated attacks in the next few days, but the need for rest on both sides brought about a speedy return to the war of positions. The embittered attacks of the Russian S. army persisted with only a few intervals for 24 days, ending in a complete victory for Austria-Hungary along the 130-km. battle-front of the VII. Army. At Rarancze only was a small portion of the front given up, whereas the Russian masses paid heavy tribute before the strong Austrian positions.

Thus the Russians failed to achieve their great aims. Their offensive was not able to save Montenegro from her fate, the Austro-Hungarian front had not been forced back, and the failure of the attack, which cost the Russians at least 170,000 dead and wounded and 6,000 prisoners, could not definitely influence Rumania's policy. (E. J.)

STUART, JAMES (1843–1913), British educationist and politician, founder of the university extension movement, was born at Balgonie, Fife, Jan. 2 1843, the son of Joseph Gordon Stuart, a manufacturer. He was educated at St. Andrews and at Trinity College, Cambridge, where he was third wrangler in 1866. In 1867 he was elected a fellow of Trinity, and became a mathematical tutor. The same year he lectured in astronomy to women teachers at Liverpool, and such was the success of these lectures that he was invited to repeat them at other centres. From this small beginnning arose the university extension movement, which, though undertaken at first merely as an experiment, has now attained a very great success. In 1875 Stuart became first professor of mechanism and applied mechanics at Cambridge, and in this capacity was responsible for the organization of the university workshops and the teaching of engineering generally. In 1882 he unsuccessfully contested Cambridge University as a Liberal, but in 1884 was elected for Hackney. He held this seat till 1885. From 1885 to 1900 he was member for Hoxton and from 1906 to 1910 member for Sunderland. He was created a privy councillor in 1909. For many years he was a Progressive member of the London County Council, and was also interested in the management of the *Star* and the *Morning Leader*. Stuart married in 1890 Laura Elizabeth, the daughter of J. J. Colman, head of the great firm of mustard manufacturers, and became a director of the firm in 1898. He died at Norwich Oct. 13 1913.

STUART, RUTH McENERY (1856–1917), American writer, was born in Avoyelles parish, La., in 1856. She was educated in private schools in New Orleans and in 1879 married Alfred C. Stuart, a planter. Her first story, *Uncle Mingo's Speculations*, appeared in 1888 in the *Princeton Review*. She moved to New York City in 1891 and soon became known for her stories of negro life in the South. She also wrote much verse for magazines.

She often appeared as a public reader of her own works, which were characterized by humour and pathos. Tulane University, New Orleans, conferred upon her in 1915 the degree of Litt.D. She died in New York City May 6 1917.

Her numerous books include *Carlotta's Intended* (1894); *Sonny* (1896); *In Simpkinsville* (1897); *Moriah's Mourning* (1898); *Napoleon Jackson, the Gentleman of the Plush Rocker* (1902); *The Second Wooing of Salina Sue* (1905); *Sonny's Father* (1910); *The Unlived Life of Little Mary Ellen* (1910); *Daddy Do-Funny's Wisdom Jingles* (1913) and *Plantation Songs and Other Verse* (1916).

STUBBS, CHARLES WILLIAM (1843–1912), English divine, was born at Liverpool Sept. 3 1843, and educated at the Royal Institution school, Liverpool, and Sidney Sussex College, Cambridge. His father and grandfather were Yorkshire agriculturists, and throughout his life he took a strong interest in the welfare of the agricultural labourer, publishing three volumes on the subject, *Village Politics* (1878), *Christ and Democracy* (1883) and *The Land and the Labourers* (1890). He was a strong Liberal with somewhat socialistic views, and was preferred by Mr. Gladstone to the living of Stokenham and Chivelstone in Devon in 1884. In 1887 he was transferred to Liverpool, becoming rector of Wavertree. In 1893 he became dean of Ely, remaining there till 1905, when Sir Henry Campbell-Bannerman nominated him to the bishopric of Truro. He was Hulsean lecturer at Cambridge in 1904, and published his lectures under the title *The Christ in English Poetry* (1905). His other works include *A Creed for Christian Socialists* (1896); *Charles Kingsley and the Christian Social Movement* (1898) and a *Handbook to Ely Cathedral* (1898). He died at Truro May 4 1912.

STURDEE, SIR FREDERICK CHARLES DOVETON, 1ST BART. (1859–), British Admiral, was born at Charlton, Kent, June 9 1859, the son of a naval officer, and entered the navy in 1871. He was promoted lieutenant (1880), commander (1893), captain (1899), rear-admiral (1908), vice-admiral (1913), admiral (1917) and admiral of the fleet (1921). He saw service in Egypt (1882) and in Samoa (1898–9) when he was in command of the Anglo-American force. He was assistant-director of Naval Intelligence to the Admiralty (1900–2) and chief of staff, Mediterranean Fleet (1905–7) and Channel Fleet (1907). In 1910 he became rear-admiral of the first Battle Squadron, and commanded the 2nd Cruiser Squadron (1912–3). During the World War he was commander-in-chief, on the "Invincible," of the squadron which won the battle of the Falkland Is., Dec. 8 1914, and he took part in the battle of Jutland. He was created K.C.B. (1913), and K.C.M.G. (1916); and a baronetcy was conferred on him in 1916, with the title "of the Falkland Is." In 1918 he became commander-in-chief of the Nore.

STURDZA, DEMETRIUS (1833–1914), Rumanian statesman (*see* 25.1051), died in 1914.

STÜRGKH, CARL, COUNT (1859–1916), Austrian prime minister from Nov. 3 1911 to the time of his murder, was born on Oct. 30 1859, of an ancient noble Styrian family, and in 1881 he became an official of the Statthalterei at Graz, and later of the Ministry of Education. He left the State service in 1891, when he was elected as a representative of the loyal land-holding interest to the Reichsrat. He attached himself to the Left of the German party, and came forward as a keen opponent of universal suffrage. He was from Feb. 10 1909 to Nov. 3 1911 Minister of Education, and a zealous advocate of the humanistic education traditional in the gymnasia. Stürgkh was one of the committee of five ministers who decided on the dispatch of the ultimatum to Serbia and the declaration of war, which brought on the World War. He was killed on Oct. 21 1916 by a shot fired by the Social Democrat Friedrich Adler, a son of the Social Democrat leader, Viktor Adler, as a protest against Stürgkh's government without parliament. (*See* AUSTRIAN EMPIRE.)

STÜRMER, BORIS VLADIMIROVICH (1849–1917), Russian politician, was born in 1849, the son of an emigrant—his father being captain of a fire brigade at Tula. He studied at the university of Petrograd, and there made friends with Count Bobrinsky, a member of one of the leading Russian families, who introduced him into the upper circle of Petrograd society. His affable manners and his ability to win the confidence of important people are the only explanation of his brilliant success in a circle to which he did not belong by birth or fortune. He started his career in the Chamberlain's department of the Imperial Court, but he held at the same time different situations in the Senate, the Ministry of Justice and elsewhere. When in 1892 the Government rejected the candidate nominated to the presidency of the executive board of the Tver Zemstvo, Stürmer, whose name was on the list of the Tver gentry, was appointed to this office. It was the first case of a president of the Zemstvo being appointed instead of being elected. In 1894 Stürmer was appointed governor of the Novgorod, and later of the Iaroslavl province. Subsequently he was in charge of a department of the Home Office. In 1904 he was created member of the State Council, but he never took an active part in the legislative work. Meanwhile he won the confidence of the Court, and he was made prime minister in Jan. 1916, at a period when the Emperor, avoiding strong personalities, wished to secure the fulfilment of his orders by devoted servants. As prime minister Stürmer's reactionary attitude provoked a strong opposition in liberal and patriotic circles; rumours accusing him of connexions with Germany were widely spread without real proof. These accusations were finally brought to the tribune of the Duma by M. Milyukov and resulted in Stürmer's resignation in November. After Sazonov's dismissal Stürmer took the portfolio of Foreign Affairs, and his activities in this department resulted in the premature declaration of war by Rumania, so disastrous for that country and for Russia. He was arrested after the revolution, and he died in prison of disease in Sept. 1917.

STYRIA (*see* 25.1058), an Austrian territory bordered on the E. by the Southern Slav State and that part of Burgenland which belongs to Austria; on the N. by Lower and Upper Austria; on the W. by Salzburg and Carinthia; and on the S. by the Southern Slav State. The part of Styria included in the Southern Slav State has an area of some 2,366 sq. m. and had, in 1910, a pop. of 433,000. The Austrian territory extends over some 6,304 sq. m., of which the greater part is mountainous and almost the whole lies in the Eastern Alps. Styria had formerly three large divisions:—Northern or Upper Styria; Middle Styria; and Southern or Lower Styria. Lower Styria and the southern part of Middle Styria, up to the Posruck range and to the Mur have, however, been taken over by the Southern Slav State. Middle Styria is surrounded on the W. and N. by a semi-circular mountain range which joins the Cetic and a part of the Noric Alps and has recently become known as the "Steierische Randgebirge." The pass through which flows the river Mur between Bruck and Graz unites it to Upper Styria. The northern part of Upper Styria is occupied by the heights of the *Nördlichen Kalkalpen.* The eastern part of the Noric Alps, the Bachern together with the Posruck, now belongs to the Southern Slav State.

Population.—The pop. of the Styria of to-day was, in 1910, 952,590; in 1920 it had decreased to about 946,720 (151 per sq.m.). It is almost purely German. The proportion of males to females in 1910 was as 1,000 to 983; in 1920 as 1,000 to 1,053. While Styria lost some 75,000 Germans, among whom were 9,000 belonging to the exclusively German-speaking districts, she has now only about 5,000 Slovene inhabitants. In 1910 the pop. of the present-day Styria was as to 97·4 % Roman Catholic and 2·1 % Evangelical.

For administrative purposes, Styria is divided into 16 districts and the autonomous city of Graz, the capital (pop. 157,032 in 1920). Other important places are:—(pop. figures are taken from the census of 1920) in the Traun and Enns district of Upper Styria—Bad Aussee (pop. 1,370); Eisenerz (pop. 6,337); Mariazell, the famous resort of pilgrims (pop. 1,881); in the Upper Mur district—Judenburg (pop. 5,668); Fohnsdorf (pop. 7,199); Zeltweg (pop. 3,682); Knittelfeld (pop. 10,672); Leoben (pop. 11,231); Donawitz (pop. 15,087); Vordernberg (pop. 2,352); Bruck an der Mur (pop. 8,490); —in Mürz-Thal—Kappenberg (pop. 12,576); Mürzzuschlag (pop. 6,483);—in Middle Styria—Köflach (pop. 2,655); Voitsberg (pop. 3,283); Eggenberg bei Graz (pop. 15,554); Weiz (pop. 3,620); Fürstenfeld (pop. 5,649) and the Gleichenberg Spa, Kurort Gleichenberg (pop. 872).

Education.—Styria has three higher educational establishments, namely the university and the technical college of Graz and the Montanist College in Leoben.

Notwithstanding the great unevenness of the surface, only 8·0 % of the present Styria could be reckoned as unproductive in 1900. Of the productive parts, 19·1 % was arable; 0·9 % gardens; 0·5 %

vineyards; 11·8% meadows; 13·3% grazing lands; 54·4% was, however, forest. This territory is justly called "green Styria." Cattle-raising has greatly developed and farming is actively carried on on the high lands. Nevertheless, in 1918 there were only 358,108 head of cattle (of which 170,630 were milch-cows) and 344,188 swine. A good breed of horses exists in Ennsthal and considerable attention is devoted to poultry-farming in Middle Styria, where the shooting and fishing are good. The forests yield a great variety of timber.

Minerals.—Styria is so rich in iron ore that it has been called the "land of iron" (*eiserne Mark*). Lignite is also abundant. Of the total output of the mines of present-day Austria (51,000,000 kronen in 1915) 71% (36,000,000 kronen) is attributed to Styria; its output of iron (1·8 million tons in 1915) is over 94% of the Austrian total. Iron-mining is almost exclusively confined to the Erzberg between Eisenerz and Vordernberg. The manufacture of iron in Austria is now almost entirely confined to Styria (538,753 tons out of a total of 541,004 tons). The most important iron-smelting works are in or near the above-named region and at Hieflau, Trofaiach and especially Donawitz; in the lignite districts, in Zeltweg and Knittelfeld, near the lignite diggings of Fohnsdorf and in Eibiswald; also in Mürz-Thal (Kapfenberg, Mürzzuschlag). The Mürz-Thal is also the centre of the newly created scythe-making industry. The lignite produced, 1·8 million tons or over 74% of the Austrian total, is found in many places. The most important mines are at Fohnsdorf in Upper Styria; the product of those near Leoben is used by the great metal works of Donawitz and others—and there are smaller mines in Mürz-Thal; in Western Middle Styria in the districts of Höflach and Voitsberg and those of Eibiswald and Wies. Styria also produces salt; 28,000 tons, some 17% of the whole Austrian output, was obtained near Aussee in 1915. It yields also almost the entire Austrian output of graphite and some sulphur, lead and zinc ores, clay and building stone. The output of magnesite has become especially important; Styria alone almost supplies the world, chiefly from the neighbourhood of Veitsch, Trieben, Kraubath, in the Breitenau near Bruck and elsewhere.

Water-power.—The plentiful and accessible supply of water-power has caused the installation of great electrical stations of which, however, full advantage has not been taken. The electrical works of Weiz are world-famed.

Manufactures.—Notable Styrian manufacturing industries are those of the iron works at the places already named, also at Pallen-Thal (Rottenmann, Trieben) and at and near Graz. These turn out a great variety of iron goods; small articles as well as scythes, machinery, locomotives (Graz), bicycles (Graz) and wagons. Graz makes carriages and automobiles and also holds an important place in the wide-spread wood industries (including furniture). The manufactures of lignite and cellulose, pasteboard, paper (Grat-Korn, near Graz, and other places), also of beer (Graz), tiles, flour, leather, explosives (Deutsch-Landsberg and other places) are considerable. Less important are flour-milling, and the textile, glass, tobacco and chemical industries.

Communications.—The new frontier cuts through the Marburg-Unterdrauburg line so that the connexion between Middle Styria and Carinthia goes a long way round, causing considerable inconvenience. Mariazell is now connected by rail with Vienna.

SUBMARINE CABLE TELEGRAPHY (*see* 26.527).—In 1921 there were over 298,000 nautical miles of telegraph cable in operation at the sea bottom, made up of some 3,000 separate lengths, of which about 2,540 were administered by the various governments concerned, whilst the remainder were the property of private (mainly British) companies. Of the world's cables, over 130,000 n.m. are owned by British companies, 71,000 by American companies, and 24,000 by companies of other countries. How much the Allied countries—especially Britain—were indebted to submarine telegraphy in connexion with the World War will probably never be fully realized. Had British communication with the Dominions been cut off at the outset by the enemy, months would have elapsed before arrangements could have been completed for the despatch of the overseas contingents which rushed to British aid. On the other hand, within four hours of the declaration of war, Germany was entirely deprived of direct telegraphic communication with the United States. A British cruiser effected the required interruption in the English Channel by cutting both the cables running between Emden and New York via the Azores, one being taken in to Penzance (Cornwall). Then in March 1917 they were both cut at points 643 and 610 n.m. respectively from New York, one of them being diverted by a British P.O. telegraph ship into Halifax, Nova Scotia. Since July 1917 this has been at any rate temporarily turned to account as a connecting link with the All-British Pacific Cable system. The other line was handed over to France and taken in to Brest.[1] Altogether 20,000 n.m. of ex-German cables were captured during the war, covering practically every one of those passing through the English Channel.

Remarkable indeed were the achievements of submarine telegraph cable- laying and repairing authorities during the war. Despite the active German submarine warfare, a vast number stand to the credit of British ships, largely to meet immediate strategic requirements. Whilst some of these were effected by cruisers of the Royal Navy provided with the necessary apparatus and the required length of cable, they were in the most part carried out by specially designed telegraph ships, though accompanied as often as possible (where especially desirable) by a man-of-war as escort. In addition to manufacturing 20,000 m. of trench telephone cable, the Telegraph Construction and Maintenance Co. made 19,000 m. of submarine cable, and its ships were actively engaged on highly dangerous work in the way of laying, repairing and diverting cables. The "Telconia"—perhaps the most efficiently designed telegraph ship in existence—made 75 cable repairs and laid 24 new lines around the English and Irish coasts whilst in commission for H.M. Post Office.

The first entirely new cable to be laid during the war was that by the Telegraph Construction Co.'s T.S. "Colonia" between Montevideo and the Falkland Is. in 1915, under the auspices of the British Admiralty. In the same year, this company also laid, under Post Office supervision, a direct Anglo-Russian cable from Peterhead (Aberdeenshire) to Alexandrovsk (about the nearest Arctic Ocean coast point to Petrograd). In both instances this was the earliest occasion on which a cable had been brought to the farther point. The first line had purely strategic objects in view, but the second was more especially to meet the fact that communication between Britain and Russia had previously been only effected across countries that were now to a great extent enemy countries; indeed, the Indo-European Telegraph Co.'s land line system had become practically inoperative ever since the outbreak of the war. This work was a truly remarkable feat. The cable was laid in the winter and was landed on Russian territory at the time of year when the sun does not rise above the horizon in those northern latitudes. In fact, the entire undertaking had to be carried out in darkness, as well as in seas infested with enemy submarines. It was conducted with every possible secrecy, it being arranged for the "Colonia," in order to mislead the enemy, to go on a preliminary cruise in an entirely different direction. With land lines at each end and special repeaters, direct telegraphic communication was thus established between the Central Telegraph Office in London and the corresponding building in Petrograd. Moreover, many telegrams from countries S. of Russia—Greece, for instance—passed over this cable in making their circuitous journey from the Levant to various quarters of the globe. This was the first piece of ocean cable work that the British Post Office had ever had to do with. Thus, for its purpose, Post Office engineers and clerks were initiated, at short notice, in the art of deep-sea cable-laying and long distance cable-working at the hands of the contractors, as well as by a staff of the Eastern Telegraph Co. provided for working the cable.[2]

The other more especially important piece of British cable work was the putting through of one of the Emden–New York cables as the first Imperial Atlantic cable to link up with the All-British Pacific line. The path taken by what now constitutes a completed "All Red" route to Australasia is London, Penzance, Fayal Isle, Azores (mid-Atlantic), Halifax, Bamfield (Vancouver), Fanning I. (a small, mid-Pacific, coral formation), Suva (Fiji Is.), Norfolk I., from whence there are two branches, one to Southport, Queensland (Australia) and the other to Auckland (New Zealand).

The Atlantic section of this "All Red" cable system was being worked in 1921 by the Post Office. Thus it has come to pass that a Government department, that, conjointly with the great cable companies, had opposed in turn the scheme for an All-British

---

[1] Owing to the enemy's submarine activities, the late German Atlantic cables could not be attended to for some 14 months.

[2] The Post Office Engineering Department's previous experience of cable work was closely confined to short Channel lines, etc.

Pacific Cable and then later that for an All-British Atlantic Cable, has been called upon itself to put into practice the latter, and now appears as an exponent of "All Red" cables generally. The department in question did much fine work during the war. At the very outset—on the eve of Aug. 4 1914, indeed—its principal telegraph ship, the "Monarch," set forth for the N., where many emergency cables were forthwith laid. It was not long, however, before she met her glorious end, and her "shattered bones" are now lying on the bed of the English Channel—the scene of most of her work. She was one of the very first vessels to be especially designed for cable-laying and repairing.

Another telegraph ship that met her end over the war was the "Dacia," owned by the Silvertown Company. This vessel had accomplished a great deal in her time, and during July 1915–Feb. 1916 she effected cable communications between Brest (France) and Casablanca (Morocco), by cutting in at suitable positions and picking up and relaying part of the Borkum–Teneriffe cable belonging to Germany. Nearly 450 n.m. of cable were picked up and relaid on this occasion, part of it in a depth of 2,000 to 2,500 fathoms. She then proceeded to establish communication between Casablanca (Morocco) and Dakar (W. Africa), by cutting in, picking up and relaying portions of the Teneriffe–Monrovia cable belonging to Germany. Eight hundred n.m. of deep-sea cable were on this occasion recovered and relaid in an average depth of over 2,000 fathoms. We have here a "record" in cable work. It was undertaken for the French Administration, and Casablanca had not up to that time been connected to Europe by submarine cable. The cable facilitated the sending of troops to France by Morocco and Senegal when greatly needed.

Messrs. Siemens Brothers' unique and highly efficient telegraph ship "Faraday"—originally designed by the late Sir William Siemens, F.R.S.—also achieved much during the course of the war on behalf of the British Post Office, which had at one time in commission practically every telegraph ship available, including the largest (T. S. "Colonia").

Even though observing constant vigilance, a telegraph ship, when effecting a repair, being deprived of manœuvring powers by attachment to the cable, is peculiarly vulnerable to anything like a torpedo attack. It is, therefore, something to be able to say that the Post Office kept Britain and the European continent in continuous electrical communication. During the early part of the war telegraph ships went about their business alone and unattended, but with the development of intense submarine warfare naval escorts had to be provided by the Admiralty. Escorts are not, however, a safeguard against submerged mines, and so it was that the old "Monarch" met her fate, going down with her flag flying. On one occasion a telegraph ship on repairing work hove up a mine with the cable, but beyond damage to machinery and breakage of crockery, no harm was done.

Apart from the disposal of four of the world's telegraph fleet,[1] there were only two instances of Germany getting the best of things in the matter of cable communication. Within the first year of the war, a German man-of-war landed a party on the deserted beach of Fanning I., and this party succeeded in cutting the All-British Pacific cable there. The other case was that of the "Eastern" cable landed at Keeling-Cocos. Here again the attacking party from the "Emden" succeeded in cutting the cables,[2] but an alarm signal which had been got through led to the "Emden's" final doom. In this case great enterprise was shown by the "Eastern" Co.'s superintendent, and in neither instance was the interruption very serious or lengthy. Though there were only these two cases of enemy disturbance of the Allies' cables, many were rendered dumb from the wear and tear of four years, during which time it was impossible to effect repairs, for lack of suitable ships and the risk of exposing slow-moving vessels to enemy attack.

During the latter part of the war, the American submarine cables on the Pacific and Atlantic Ocean coasts were taken under control of the United States Government. *Inter alia* there was a feeling that considerable advantage would attach to the coördination of all the telegraph systems throughout the country. Eventually (Nov. 2 1918) the U.S. Postmaster-General also assumed administrative control of all cable landing on U.S. territory, after the necessary negotiations with other countries concerned had been carried through. Control ended on May 2 1919.

Post-war Developments.—War wastage, the banning of private codes, considerable general increase of traffic[3] (partly owing to absence of mails) and voluminous Government messages, were all responsible for an appalling cable congestion during the war, the result being several days'—sometimes even weeks'—delay in the transit of messages on most of the more important trunk lines. Though, after the Armistice things became somewhat easier, with the withdrawal of the censorship and the renewal of private codes, the ultimate delivery of cablegrams was even in 1921 a very slow business. When the Marconi Trans-Atlantic wireless service was re-established some measure of relief was felt. Unfortunately, however, it was only capable of dealing with a small proportion of the ordinary prevailing cable traffic. The hampering of trade, during the war, by the prohibition of most private cable codes, was very considerable. To take an example, a certain firm had been in the habit of sending every week some 40 cablegrams at an average of £1 each. The cost of the same messages in plain English would have been some £320.

Most of the cables requiring repairs after the war had been attended to by 1921, but there was still considerable delay on cablegrams, even though the lines were being worked at their full capacity, day and night.

When it is remembered that in the year before the war (1913) 826,000 messages passed through the two Atlantic cables then connecting the United States with Germany,[4] it will be realized what it meant to American commerce alone to be deprived of these direct cable connexions. In 1921 it was planned to lay a new Atlantic cable between the two countries, and to extend the German cable that had been taken into Brest by the French, as a compromise, to central or northern Europe with a landing *en route* off Denmark.

Ever since all of what were formerly British Atlantic cables passed, in 1912, into the administrative hands of the Western Union Telegraph Co. of America, the British Government had been strongly urged—as, indeed, for many years previously—to establish a State Atlantic Cable as a connecting link with the All-British Pacific Cable. The war only served to accentuate this view. Whilst the capture and diversion of the German Atlantic Cable (taken into Penzance and Halifax) went some way to meet requirements, this line had not only been irregular in its performance but much congested with traffic, largely American. When therefore, in 1919, the Western Union Co. brought to an end their lease of the Direct United States Co.'s cable system—between Ballinskelligs (Ireland), Halifax (Nova Scotia) and Halifax–Rye Beach (United States)—on the ground of it being so constantly out of operation—the British Government entered into negotiations, towards the end of 1920, for the purchase of the line at a cost of £570,000, or scarcely more than half the value of a new cable. When this is given effect the line—together with the Imperial Pacific Line—will form a complete and strictly "All Red" route between the Mother Country and Australia. Though the line (originally laid in 1874) is even of more ancient order than the ex-German cables, British Imperial needs will, to a great extent, be met. The shortcomings will be further met when a Canadian land line, connecting the All-British Atlantic and Pacific Cables, is provided.

The All-British Pacific Cable, first laid in 1902, has more than justified itself. During its first year scarcely more than 200,000 words were sent. Ten years later, the volume of traffic had been increased ten-fold. The war brought this up to some 26,000 words per day, or about 9,500,000 words per annum. Notwithstanding the large capital cost of this line (£2,000,000) it produced a gross profit of £94,000 for the year 1920; whilst its reserve fund stood at nearly £1,107,000. To illustrate the high strategic value of the line, during the war, if the Allies had happened to be—even temporarily—deprived of naval control, the British Mediterranean cables would undoubtedly soon have been cut, which would have meant that British inter-imperial telegraphic communication could only have been secured by means of the All-British Pacific line. It had been felt for a long time that, since the Imperial Pacific cable was laid as far back as 1902, steps must be taken to duplicate it in order to provide against complete breakdown, as well as for dealing with over-congestion. In 1921, however, owing to the necessity for economy and to the high cost of materials, it seemed probable that this duplication would require to be limited, for the present, to the duplication of the long, slow working, section in very deep water, *i.e.* the 3,458 n.m. between Bamfield (Vancouver) and Fanning I., which runs into a depth of 3,400 fathoms (nearly 3½ n.m.), and brings down the resultant speed on the whole line to a low figure.

---

[1] The total number of such vessels in 1921 was 49, of which some half dozen were owned by contractors for the original laying of ocean cables, the rest being smaller vessels, of the cable working companies, for subsequent repairing operations.

[2] The officials in charge had, however, prepared a ruse by utilizing some spare cable as a dummy, and this dummy the Germans solemnly cut.

[3] In the case of the Eastern Co.'s system this was more than doubled by the war. Thus, the annual gross receipts of the company were about £2,000,000 more than previously, and much the same applies to others in the same group.

[4] In actual fact these cables accounted for 32% of the total traffic of the Commercial Cable Company.

Perhaps nothing contributed more in the past to the leading commercial position of Britain than her enterprise in the matter of telegraph cables. Fortunately, too, she also recognized that the problem of Empire is largely a problem of communication. Arising out of the war to some extent, there has been a general demand for a great deal more inter-communication, not only between different branches of the British Empire, but also between distant foreign countries. This demand must be met in the first place by a considerable addition to the world's cable system over and above those that were in operation previous to hostilities. The part of the British Empire which in 1921 was more especially badly served in the matter of telegraphic communication was the West Indies, where, largely owing to the nature of the sea bottom, the existing inter-insular lines (originally laid in 1870) were constantly breaking down.[1] But for "atmospherics" in these tropical regions, this would be an ideal case for "wireless." As it is, it would seem that an efficient air service would do most to improve prevailing shortcomings—at any rate for mail purposes, the steamer service being also very deficient. From a world standpoint, however, probably the most acute need for additional cable facilities is in the Pacific Ocean, for, while the traffic over the N. Atlantic cables has been practically quadrupled since 1913, Pacific cable traffic has increased nearly nine-fold.

The war also aroused the United States to her disadvantage in the matter of cable communication as compared with her trade rivals. Thus, on April 26 1921, the U.S. Senate passed a bill "to prevent unauthorized cable landings in the United States or any of its possessions." The bill gives the President sweeping authority also to issue, withhold and revoke licences as to cable landings, as well as for obtaining concessions for the United States in other parts of the world. Section 2 of the bill enables the President "to withhold or revoke such licence when satisfied such action will assist in obtaining for the landing or operation of cables in foreign countries or in maintaining the rights or interests of the United States." The President may grant such licence on such terms as will assure just and reasonable rates. The licence is not to give the licencee exclusive rights of landing or of operation, in the United States. The policy appears to be based chiefly upon considerations that shall guard against consolidation or amalgamation with other cable lines, while insisting upon reciprocal accommodation for American corporations and companies in foreign territory. In 1920 the U.S. authorities refused to allow a cable laid for the Western Union Co. to be landed at a point on the coast of Florida on the ground that it was intended for connecting up, *via* Barbados, with the "Western Telegraph" system (at Maranham) of a British company.[2] The American Government considered that allowing such a cable to be laid would have lent colour to the British company having sole rights of communication between the United States and Brazil. As a matter of fact, another American company (All America Cables, Inc., of New York)[3] was also preparing to lay a cable to the Brazilian Coast, and it was thought by the U.S. Government that by acceding to the application of the Western Union Co., the claims to a monopoly being possibly established thereby might prevent the other cable being laid—a cable greatly to the interests of American trade with Brazil. The United States had evidently determined to establish its own system of cables throughout the world, partly for high national reasons, but also with a view to developing trade, especially with S. America.

France also has shown a disposition to be increasingly active and enterprising in this matter; likewise Japan.

International Cable Conference, 1920–1.—Probably no telegraphic conference has ever been the scene of such acute disagreement on essential points as that which held sittings during parts of 1920 and 1921 at Washington. This was perhaps natural, when we remember (*a*) that Germany had been relieved of practically all her cables, (*b*) that the destiny of these cables was of first-rate importance to all the principal powers.

Soon after the confiscation of the German cables an agreement was entered into between Great Britain, France, Italy and Japan, whereby these ex-German lines were to be severally distributed amongst them. The United States having come into the war some time later, it was proposed at the Conference, that these cables should, as a substituted arrangement, become the joint property of the five Allies.

The actual diversion of the German Atlantic cables was completed by Great Britain in July 1917, and by France in Nov. 1917—in both instances after the United States had joined the Allies. The American view was, therefore, that neither of these appropriations of cables between the Azores (Portuguese possessions) and the United States could be justified, seeing that both the United States and Portugal were already allied with England and France in the vigorous prosecution of the war. Then again, no single section of the ex-German cable in the Pacific touched Japanese soil, but one landed on American territory (Guam). Thus it was argued that it was something of an anomaly that the Japanese should ever have seized the German cable system, to the great detriment of American trade with China and the Philippines—and correspondingly to their own (Japanese) advantage.

There were probably few matters that could, in principle, be dealt with so suitably by the League of Nations as those associated with international telegraphic communication. But that could only apply if, and when, the United States joined the League, or, on the other hand, in instances where America was in no way concerned. With ex-German islands and cables, however, it was quite clear that the United States was very much concerned. Further, there was no nation whose interests were liable to be so much affected by the mandate as regards Yap—more especially in reference to the cable—as the United States. The control of telegraphic communication between that island and China meant much to Japan. On the other hand, such an arrangement was regarded as contrary to American interests. In these circumstances, seeing that the United States was one of the "principal Allied and Associated Powers," the question was raised why such a mandate was ever granted to Japan without the assent of the United States. However, the Yap difficulty was eventually settled, so as to preserve American rights, at the Washington Conference in Dec. 1921 (*see* JAPAN; also WASHINGTON CONFERENCE).

[1] *Report of the Royal Commission on Trade between Canada and the West Indies* (Cd. 5369, 1910).

[2] The prospects of trade with S. America are, in fact, so attractive that telegraphic communication therewith has been made a special consideration of recent years both in Britain as well as in the United States. Thus, in order to improve the then existing facilities, a cable was laid in 1910 by the Telegraph Construction & Maintenance Co. between St. Vincent, Ascension and Buenos Aires, these sections now forming a part of the Western Telegraph Co.'s system. In 1920, the same company laid a cable between Maranham and Barbados.

[3] Formerly the Central & S. American Telegraph Co., with lines down the W. coast of the American continent.

It was perhaps in the nature of things that those countries—such as the United States—which were in a less favourable position in the matter of cable ownership should especially desire the internationalization or neutralization of cables. Certainly, the neutralization and internationalization of cable systems might have one advantage, *i.e.* bring to an end the suspicions, right or wrong, that messages concerning another country were delayed, scrutinized, tampered with, etc. Such charges were largely due to keen commercial rivalry, and principally—if not entirely—a question of news agencies rather than cable companies. Any foundation they had was probably more or less closely limited to the war, when certainly Canada was very ill-supplied with news from Europe—or indeed, with reference to Imperial matters—whilst over-abundantly informed of trouble in Ireland.

Strategic Cables.—Unless the strict neutralization of cables becomes the order of the day, under the League of Nations or otherwise, the best principle would probably be that every country should—partly for strategical reasons—establish for itself many more cables on a variety of routes well clear of foreign soil. These should be worked on a low rate basis for the general encouragement of intercommunication, but especially for developing commerce and trade. They should be supplemented by wireless, which is already in use as feeders to the cable systems. There can be no question that messages passing through cables touching foreign territory are insecure. If the cable lands on an enemy's country, the message is stopped or read off, and if on neutral soil, it runs the chance of also finding its way to the enemy, if only because a country which is neutral to-day may be unfriendly to-morrow. A clear distinction must be observed between an international submarine cable and a national cable. An international cable is one which connects the territory of different independent states; a national submarine cable is one which unites the territory or the colonial possessions of a single independent state. The character of the charter or ownership of a submarine cable determines whether it should be deemed foreign or national in respect to a particular state. Apart from their great strategic value, the Chambers of Commerce of practically every important town in the United Kingdom have, on strictly business grounds, loudly urged for a system of All-British cables worked at comparatively easy rates. The same course has also been taken at various influential congresses of the Chambers of Commerce of the British Empire, partly with a view to ensuring against enemy interruptions and eavesdropping. Promoters of private enterprise are indisposed to undertake the laying of cables of a strategic, rather than commercial, order. On the other hand, the cables on the trade routes—through the Mediterranean, etc.—are especially liable to interruption, much more so than those in the open ocean.

Cable Tariff.—The ordinary cable rates, though showing material reduction from those of the earliest days, were in 1921 still very high from the public standpoint.[1] For financial reasons, they were largely based on the length of cable involved (see accompanying table), whereas it is just in the case of especially great distances that the cablegram is at an advantage against the mail boat. Here is a striking case where public (*i.e.* national) and private interests necessarily clash, and where, of course, national interests should be made supreme. This, it is to be feared, can be done only by adequate state control.

In the final report (Cd. 8462) of the Dominions Royal Commission in 1917 expression was given to the view that "charges are very high, the scales extremely complicated and their justification difficult to recognize." The report goes on to say: "The popularization of the cable service can only come with a simplification of the charges and their radical reduction; at present outside its commercial use cable communication is a luxury."

In 1912 a system of half rates for plain-language cablegrams deferred in transmission for 24 hours was introduced after many years' outside pressure. This reform marks something of an epoch in the history of cable telegraphy, and has, in due course, become universal. Week-end cablegrams at a reduced rate were also introduced a little later, this being further supplemented by reduced rates for press messages between Britain and her Dominions. There is also now the "cable letter" service which offers even more favourable rates.

With practically all the great cable companies, the tariffs were maintained throughout the war at the same normal figure, whilst considerably more business was done than under peace conditions. A great increase in Government messages occurred, and the suspension of private codes added vastly to the length of most business telegrams, not to mention the continuous flow of extensive press "cables" relating to the war. Then, again, an enormous number of messages were sent such as in normal times—free from postal shortcomings—would be limited to ordinary written correspondence or to "deferred" traffic, which was abandoned by most of the cable companies throughout hostilities. The net result was that these organizations, unlike railway companies, not only maintained their reserves, but very materially added to them during the war. The best explanation here is to be found in the fact that cable repairs to be faced after the long period of warfare were altogether abnormal, though it must be remembered most of the companies concerned already had enormous reserves. The principal exception is the case of the Central and South American Telegraph Co., combined with the Mexican

---

[1] Some of the more recent reductions may possibly be due in part to the competition—such as it is—of wireless telegraphy.

Telegraph Co. (the former operating what are now known as the All-America Cables), which, during the war, made large reductions in their tariff, even though, on the greater part of their route, holding a monopoly. The directors expressed their conviction that (*a*) the cable performs a very special mission during warfare, and (*b*) it plays a highly important part in the fostering of trade relations. They were, therefore, determined to aid in every way possible the efforts to maintain and extend the already large trade between the United States and the countries of Central and S. America.

It must not be forgotten that an essential accompaniment to a low telegraph tariff is many more communicating strings; otherwise, the congested condition only becomes worse congested. On the other hand, it is also only by great developments—of one sort and another—in our means of communication that an increased, as well as cheaper, telegraphic output can be secured.

Nationalization.—One result of the Dominions Royal Commission's exhaustive inquiry was the following expression of opinion.[1] "We feel bound, however, to record our opinion that at no distant date the nationalization of the private cable companies will become one of the most urgent problems for statesmanship." Their report states further:—"It appears difficult, if not impossible, to attain the desired cheapness of cable communication, as to the importance of which we hold the strongest views, without interfering with the rights of private companies." Again:—"The urgency of placing cable communication on such a footing that it would be available, not only to the rich, but to all classes, not only to the merchant, but also to the private individual, is manifest and imperative."

But it must not be forgotten that the world is indebted, in the first instance, to the enterprise of private companies for the establishment of submarine cable communication. Some of the companies have certainly been assisted in their enterprise by large Government subsidies.[2] Moreover, these companies have met with rich returns over their enterprise.

Telegraph Control Board.—Whether State ownership should ever be adopted by a country is, of course, a large question, but it seems obvious that in national and imperial interests a measure of State control is desirable in the matter of inter-imperial communications generally. A controlling organization of one sort or another appears to be called for, if only for watching and securing public interests, where clashing with private interests, in return for favours granted by the State.

In the case of Great Britain there are no less than seven Government departments (in addition to the Treasury) concerned in this matter. Hitherto one of these alone (the Post Office) has been acting for the Government, and all questions regarding other departmental interests had to be submitted to the Post Office. This was never very satisfactory in the result.

A British inter-departmental board to deal with inter-departmental telegraphs of all sorts has been advocated for many years. By this scheme, all the Government departments concerned were to be represented and to meet periodically to discuss and settle all important matters as they arose. The war made it clear to the British Government that something of the sort was necessary; and Jan. 1 1919 saw the establishment of such a committee, the whole coming under the *aegis* of the Committee of Imperial Defence. Such a control board, or committee, becomes increasingly desirable in these days of wireless development, for a nice sense of impartiality and discrimination may be required for deciding what should be effected by cable and what by wireless.

Working Developments.—The development of the art of submarine telegraphy was considerable during 1907–21—not so much in relation to the cable itself as to the electrical apparatus for working it. These include the introduction of automatic relays (associated more especially with the names of the late Dr. Alexander Muirhead, F.R.S., and Mr. S. G. Brown, F.R.S.) on the Eastern, Western Union, All-British and Commercial-Pacific cables, as well as other wide-spread cable systems.

These have almost entirely superseded manual retransmission between cable sections. Secondly, the introduction of magnifiers (or amplifiers, as they are sometimes called), by rendering the signals more legible, has enabled the carrying capacity of the cables to be enormously increased, at the same time adding to their reliability in the matter of accuracy. Such devices are based on the published experiments of Charles Curtis in the United States and Edward Raymond-Barker in England, and emanate in turn from K. C. Cox, T. B. Dixon, Walter Judd, Angus Fraser, E. S. Heurtley and Axel Orling. The Heurtley magnifier has been very widely adopted by the Pacific Cable Board, the Eastern Association Companies, etc. In vastly improving the character of the signals, this type of apparatus achieves the net result of adding to the effective working speed in the same degree. Indeed, the later results with the Orling magnifier point to a speed increase of as much as 200 per cent.

Thirdly, automatic printing apparatus has been introduced on the land lines worked in conjunction with cables. This apparatus is for the most part due to Mr. F. G. Creed.

Then again, Maj.-Gen. G. O. Squier, Chief Signal Officer of the U.S. army, has experimented with alternating current generators for cable telegraphy, and his researches point to results of a highly advanced—as well as revolutionizing—character.

The Imperial Cable section of the "All Red" route is associated with some of the latest developments in cable telegraphy. The transmission both at London and Halifax is effected by what are known as converter cable transmitters. These are entirely automatic in their working, and, by the use of a switch, will take either Morse or cable type of perforation. There are automatic repeaters at each of the intermediate stations. One of these sections, *i.e.* Bamfield–Fanning, 3,458 n.m., is the longest existing cable length, and has always been a source of great difficulty in the matter of speed as well as from a commercial point of view generally. In the circumstances, the results that have been achieved, by means of recent electrical devices, are very remarkable. It is, indeed, highly creditable that the score of a cricket match can be got through from Melbourne to London within 15 minutes, despite the six intermediate retransmitting points, over so great a total length. A few years earlier, such retransmissions were always effected manually. Now, however, automatic (machine) repeaters are gradually becoming general for all extensive systems with a number of intervening cable sections. The average duplex working speed on the entire route (controlled by that of the long section) was formerly 18 words per minute,[3] but it has been very considerably increased by means of the Heurtley amplifier or magnifier. Something like a 40% increase in the simplex working speed (or 20% duplex) is claimed on this apparatus, which converts the microscopic signals associated with a long cable worked at high speed into characters of reasonable size. On the Atlantic sections some of the very latest devices have been introduced for the purposes of efficient and high speed working, such as had previously been adopted by the Eastern Associated Telegraph Companies. In the main, the plan is that of Morse working in connexion with the Gulstad Relay, so that the speed of connecting land lines is brought up to that of cable code working.[4] The Eastern Compa-

[1] Final Report (Cd. 8462 of 1917).

[2] These are as follows:—

Name of Company	Amount of Subsidy	Period of Subsidy	Cables for which Subsidy granted
	£		
Eastern Telegraph Co.	4,500	20 years from April 24 1901.	Sierra Leone-Ascension.
Eastern & S. African Telegraph Co.	28,000	20 years from Nov. 1893.	Zanzibar-Seychelles-Mauritius.
	13,500	20 years from Jan. 1 1900.	Three S. African cables.
Eastern Extension Co.	4,000	Indefinite.	Chefoo-Weihaiwei.
Direct West India Co.	8,000	20 years from Feb. 1 1898.	Bermuda-Jamaica.

[3] Nearly all long cables are now worked on the duplex system.

[4] On the Indian Government (Persian Gulf) system between Basra and Karachi, the speed for land line Morse was actually raised from 35 to 75 words per minute.

nies have further greatly added to the efficiency of their system by means of the Creed Printer, which is also installed on the Atlantic section of the "All Red" route, as well as in connexion with Wheatstone high-speed working on the Pacific cable land line system between Melbourne and Sydney.

A Stock Exchange Telegraph Service of a highly efficient order was established some years ago between London and New York. So efficient is this that messages are got through within ten minutes. Something like 2,500 such messages are transmitted between the two Stock Exchanges during an afternoon.

Cables and Commerce.—In pre-cable days each country was, in large measure, an independent commercial unit. The submarine cable has done much to alter that state of things. Whereas in 1870 the total value of the commerce between the United States and Great Britain was about £90,000,000, in the fiscal year ending June 30 1920 it was as much as £525,000,000. Besides the enormous increase in volume of business brought about by the extension of telegraphic service across the oceans, this quickened communication has also brought a complete change in business methods. It has, indeed, introduced an element of stability into international trade such as was seriously lacking when intercourse depended solely on the mail.

The World War has tended also to increase cable traffic because of changed business habits. During the early months of the conflict a rigorous censorship on cable messages was enforced by the Allied Governments. At first codes of all kinds were prohibited, and although this regulation was subsequently modified to allow the use of ordinary commercial codes, private codes and lighter messages were stopped. As a result, many business firms discovered that for much of their cable business the time and labour spent in coding and decoding—as well as the errors which are inevitable in the transmission of unintelligible matter—made messages in plain language only slightly more expensive than code. The result after the war has been a considerable increase in the percentage of plain-language messages. Another factor in the greater traffic has been the increased use of the cables for transactions which were formerly carried on by mail. This has been due partly to changed conditions which have made speedy communication more than ever necessary, and partly to the fact that the business houses, which were forced to increase their use of the cables during the war, have continued to do so on discovering the great convenience of cable communication in comparison with the mail.

SUBMARINE CAMPAIGNS.—At the beginning of the World War the submarine was a comparatively new weapon of untried possibilities, whose ultimate place in naval warfare it was hard to foresee; and there ensued a period of tentative effort, confined at first to the North Sea, which lasted from Aug. 1914 to Feb. 1915. Germany started the war with 28 submarines, but the unreliable nature of the Korting engines fitted in the first 18 boats (U1–U18) had given her a low opinion of their merits. This was accentuated by the result of the first operation of the war consisting of a sortie by 10 boats up the North Sea, in which U15 was rammed by the light cruiser "Birmingham" on Aug. 9 1914 and U13 disappeared. On the British side some 56 submarines were available, the newest boats of the D and E class being attached to the 8th Flotilla (18 boats) employed under Commodore Roger Keyes in guarding the approach to Dover Straits with a couple (E6 and E8) reconnoitring in the Bight.

Early Days of the War.—Submarines did not play a decisive part in the Heligoland Bight action on Aug. 28. The six British submarines present were disconcerted by the unexpected appearance of British light cruisers, and the German submarines were retained off Heligoland guarding the approach to the rivers. The first British warship to be sunk by submarines was the "Pathfinder," a small cruiser torpedoed by U21 (Otto Hersing), off the Forth on Sept. 5, an incident which aroused little comment beyond emphasizing the danger of old ships patrolling on regular beats. The sinking of the "Cressy," "Hogue" and "Aboukir" off the Dutch coast on Sept. 22 1914 was a much heavier blow. They had been sent to patrol on the Broad Fourteens, between England and Holland, and were steaming slowly in line abreast two miles apart at 6:30 A.M. when the "Aboukir," "Hogue" and "Cressy" were torpedoed in quick succession. This was the work of Otto Weddingen in U9, and the wholesale disappearance of Cruiser Force C within an hour with a loss of over 1,400 men came as an unpleasant shock, and definitely established the power of the new weapon. By the end of Sept. submarines were pushing past Dover Straits into the Channel, and on Oct. 16 1914 the fear of the new weapon reached a climax, when on a false alarm of one in Scapa Flow the British Grand fleet hastily put to sea at night and proceeded to Lough Swilly where by a freak of misfortune the "Audacious" ran on a mine and was lost. Oct. 20 1914 had seen the sinking of the first merchant ship, the ss. "Glitra," off Norway by U17, but it was not until Nov. 23 that U18 actually attempted to enter the Flow. The Grand fleet were at sea at the time and U18 was rammed by a minesweeper, the "Dorothy Gray," close to the Hoxa entrance. She went down to 11 fathoms with her hydroplanes damaged, and coming to the surface later was rammed by the destroyer "Garry" and forced to surrender, the first and (with the exception of UB116 in 1918) the last attempt to enter Scapa Flow.

Defensive Methods.—The war found the British navy almost destitute of defensive methods against the submarine. A committee had sat on the subject but had evolved nothing but the modified sweep—a somewhat clumsy contrivance consisting of a line of explosive charges towed astern, regulated in depth by a water-kite and fired from inboard. The defence of Scapa had been mooted as early as 1912, and Adml. Jellicoe, then at the Admiralty, had taken an important part in discussions on the subject, but nothing had been done beyond allocating a small sum for the purpose in 1913, which was diverted to Dover to build a wall on the breakwater, in pursuance of the pre-war tendency to try and fit prospective wars into the existing naval ports. By the end of 1914 Cromarty had been supplied with Capt. Donald Monro's boom, but Scapa with all its entrances was not secure till Feb. 1915. Counter measures at this stage of the war were confined to an extensive development of the Auxiliary Patrol organization, the tentative supply of defensive armament to merchant shipping, and the equipment of a comparatively small number of vessels with the modified sweep. The trawlers of the Auxiliary Patrol played an important part in minesweeping and in escort work, but were too slow and too poorly armed to be really effective in offensive operations against the submarine. By the end of 1914 the submarine was generally recognized as a new and powerful weapon in naval warfare, though its tremendous potency as an instrument of the *guerre de course* had not been fully realized. Germany had lost 7 and with the addition of 11 had 30 now available, with 42 U boats and 127 UB and UC under construction and on order. Von Tirpitz, fully alive to their possibilities, was already building great hopes on them.

The early morning of New Year's Day 1915 saw the old battleship "Formidable" (Capt. A. N. Loxley) fall a victim to U24 off Start Point while patrolling up and down with the Channel fleet at 10 knots. The captain went down with the ship. Only 141 were saved out of a crew of over 800, and the incident demolished once and for all the opinion of a certain school of naval thought that the submarine could be ignored.

They were now going farther afield. Otto Hersing in U21 made his first cruise to the Irish Sea in Jan. 1915, and this month too saw the first instances of a ship being torpedoed without warning in the case of the British s.s. "Tokemaru" and s.s. "Ikaria" off Havre on Jan. 30 by U20 (Schwieger, who was to earn an unenviable reputation for ruthless warfare).

Campaigns of 1915.—Feb. 4 1915 saw the close of what may be termed the preliminary phase of submarine warfare. The German naval staff now decided to conduct a general campaign against merchant shipping, and on this date the German Government issued a declaration constituting all waters round Great Britain and Ireland a war zone (*Kriegsgebiet*), in which from

Feb. 4 all enemy merchant ships would be destroyed without it being always possible to avoid danger to passengers or crew, and where even neutral vessels would be exposed to danger of attack. This evoked on Feb. 11 a strong protest from the United States denouncing it as an indefensible violation of neutral rights. The date was postponed to Feb. 18 and the order modified to the extent that neutral ships were to be spared, though in adjudging their neutrality all circumstances and not the flag only were to be taken into account. March 18 1915 saw the end of Otto Weddingen in U29 which was on her way home round Great Britain, about half-way between Kinnaird Head and Norway, when she was rammed by the battleship "Dreadnought" after attacking the battleship "Marlborough." The inauguration of the new campaign was followed in March by the establishment of the Flanders flotilla, which at first consisted of small UB and UC boats working chiefly round the Thames and east coast. By Oct. 1915 it had grown to 16 boats, and was contributing a fair proportion of the ships sunk.

The Flanders flotilla had hardly started its career when it met with a formidable obstacle in Dover Straits. Experiments had been proceeding for some months in the use of steel wire nets to indicate and obstruct the passage of submarines, and the admiral at Dover (Rear-Adml. Hon. Horace Hood) now succeeded in closing the Straits by this means for over four months. The nets used were in lengths of 100 yds. and 60 or 30 ft. deep, shot by drifters, and by Feb. 13 1915 he had some 30 drifters riding to their nets in the Straits. Bad weather took a heavy toll of the equipment, but the results were surprisingly successful to an extent hardly appreciated at the time. U8 fouled one of these nets on March 8 1915 off the Varne and was forced to come up by the destroyer "Ghurka," which exploded a modified sweep over her. U37 went down the Channel later in the month and never returned. Early in April U32 got caught in a net, and had so much difficulty in getting clear that she went home northabout. She drew a formidable picture of the obstruction, and on the strength of her report the Bight flotillas received instructions to go northabout, and the Flanders boats following their example also eschewed the Straits for over four months. It was thought at first that in the net a permanent antidote to the submarine had been found, and net bases were established at several ports, particularly at Larne for the North Channel, but technical difficulties (clips and indicator buoys) supervened, and the Germans overcame the lighter form of net by net cutters.

The sinking of the liners "Falaba," "Lusitania" and "Arabic" constituted three beacons in the 1915 campaign. The former, an Elder Dempster liner of 4,806 tons on the way to Sierra Leone, was torpedoed with five minutes' warning on March 27 by U28 off the south of Ireland, and sank in eight minutes with the loss of over 100 lives. The indignation arising from this incident had hardly subsided when it was fanned to fever heat by one of the most momentous incidents of the war. On May 7 1915 Schwieger in U20 was off the Old Head of Kinsale (south of Ireland) when he sighted a great liner homeward bound. This was the "Lusitania" going only 18 knots, her decks crowded with women and children. At 2:15 P.M. he sent two torpedoes into her without warning and she went down in 20 minutes with the loss of 1,198 lives, while Schwieger "moved with mixed feelings" watched the terrific scene. A chorus of applause arose in Germany, but the deed can be seen now as an error of the first magnitude, which set on foot the whole train of circumstances which brought America into the war. The controversy between the German naval staff and the Chancellor immediately reached a crisis. The latter refused to be responsible for such acts, and on June 5 1915 an imperial order was issued forbidding the sinking of large passenger vessels. Von Tirpitz, the Secretary of State, was furious, and he and Bachmann, the chief of the naval staff, both sent in their resignations, but were commanded bluntly to remain at their posts.

Meanwhile Otto Hersing, the pioneer in distant fields, had sailed on April 25 in U21 for the Mediterranean. Arrangements had been made to provide him with oil on the way, probably in the vicinity of Tangiers, but they broke down, and he arrived at Cattaro on May 13 with only half a ton of oil fuel left. He reached the Dardanelles on May 25 and instantly made his presence felt. The "Vengeance" was missed by a torpedo that day; the old battleship "Triumph" supporting the Anzacs off Gaba Tepe was hit by two torpedoes at 12:30 P.M. and turned turtle in nine minutes with a loss of over 200 lives. Two days later (May 27) the "Majestic," supporting the troops inside the Straits, was hit and capsized with the loss of 49 men. The whole system of naval bombardment received a severe shock, though it was not till Aug. 13, when the "Royal Edward" was sunk near Kos by UB14, that the transports began to suffer.

By this time another counter to the submarine had been found in the decoy ship, whose early type consisted of trawlers or vessels with submarines in tow. Three submarines were sunk in this way during the summer of 1915 (U40 on June 23 by C24, U23 on July 20 by C27, and U36 on July 24 by the "Prince Charles"). Aug. 19 1915 saw the destruction in the approach to St. George's Channel by the decoy ship "Baralong" of U27, while she was attacking the "Nicosian." Several German sailors had boarded the latter vessel, and the American cattlemen in her, when they saw the submarine disappear, fell on them and threw them overboard. Germany gave vent to a roar of indignation, undisturbed by the fact that the very day U27 was sunk U24 (Schneider) met the White Star liner "Arabic" outward bound off the south of Ireland and sank her without warning with the loss of 44 lives. Indignation in America flamed up anew. Again at great headquarters von Tirpitz wrestled with the Chancellor and again the Chancellor won the day. The use of decoy ships and defensively armed merchantmen, by increasing the danger of coming to the surface, provided the German naval staff with a strong argument for unrestricted warfare, but the imperial decision went in favour of the Chancellor, and orders were issued on Aug. 30 that no liners were to be sunk without warning and due regard for the safety of passengers. This was a bitter blow to the partisans of submarine warfare, and Adml. Bachmann, the chief of the naval staff, who had not been consulted on the issue, resigned and was succeeded by Adml. von Holtzendorff. The commander-in-chief of the High Sea fleet, Adml. von Pohl, also asked to be relieved, but to no purpose. He was told he did not understand the political situation. On Sept. 20 1915 further orders were issued to suspend submarine warfare on the west coast and in the Channel. The campaign now languished in British waters. From Sept. 1915 to Feb. 1916 activity against merchant shipping practically ceased in the Bight and was transferred to the Mediterranean.

During the year Feb. 1915 to Jan. 1916 a total of 394 Allied and neutral ships had been sunk by submarines with a gross tonnage of 1,059,141 tons; of these 225 (760,440 tons) were British, 54 of which had been sunk in the Mediterranean. Some 60 merchant ships had been sunk without warning during the year and 17 submarines had been destroyed, an average of one submarine for 23·1 ships.

The Baltic.—Meanwhile British submarines had been active in the Baltic and the Dardanelles, where a great field had opened to British heroism. In the Baltic E9 (Comdr. Max Horton) and E1 (Comdr. N. F. Laurence) were the first to penetrate early in 1915, and proved a valuable addition to the Russian (Adml. Essen's) force. On July 2 1915, when the Russians sank the minelayer "Albatross," E9 sent two torpedoes into the old cruiser "Prinz Adalbert" and drove her back to port. On Aug. 4 1915 E13 ran ashore on the Danish island of Saltholm while passing the Sound. Before the 24 hours given her by the Danes to get off had elapsed two German destroyers appeared and, opening fire on her, killed half the crew, an act which did not pass unavenged. The Germans at the time were making a determined attempt to force the Gulf of Riga with a view to operating on the Russian flank, and the battle-cruisers of the 1st Scouting Group with the 1st Battle Squadron and a number of light cruisers had been lent for this purpose by the High Sea fleet. E1 now appeared on the scene, and the very day that E13 received its deadly hail of fire sent a torpedo into the battle-cruiser "Moltke" off the Gulf of Riga, driving her back to port.

Winter did not stop the activity of the British submarines. In the latter part of 1915 E8, E9 and E19 (Comdr. F. A. N. Cromie) attacked the important iron ore trade from Lulua (Sweden) to Germany, and between Oct. 11 and 23 sank 14 large German steamers engaged in it. The "Prinz Adalbert" too was sunk by E8 on Nov. 8, and on Dec. 12 the light cruiser "Bremen" and destroyer V191 were sent to the bottom. The Germans now set to work vigorously to devise counter measures. Minefields were laid in the Sound off Drogden, in the Flint-Rinne at the southern end of the passage on the Swedish side and at Falsterbo; an old battleship was stationed to defend them; torpedo flotillas were despatched to patrol the entrance to the Baltic, and convoy flotillas were organized for the Swedish trade with the result that British submarine activity suffered a severe check and the difficulty of entering the Baltic was greatly increased. The work of submarines there was also seriously hampered by the inability of the Russian dockyards to cope with their demands, an unmistakable indication of the probable failure of any attempt to conduct a big campaign in that sea.

The Mediterranean.—In the Mediterranean the ability of submarines to assist the Dardanelles campaign by interfering with Turkish transport in the Sea of Marmora was fully realized, but the passage of the Dardanelles was not an easy proposition. Twenty-seven miles long with a width of only a mile in the famous Narrows (the $3\frac{1}{2}$ m. stretch between Chanak and Nagara) lent itself easily to defence, and could be transformed into a veritable trap for submarines. It is impossible to give the details of every passage where every passage was an heroic venture. Lt.-Comdr. Norman Holbrook had made the passage on Dec. 11 1914 in B11 and torpedoed an old battleship, the "Messidiyeh." E15 (Lt.-Comdr. T. S. Brodie) was now the first to go up on April 15, but grounded in Kefez Bay (on the Asiatic side some 10 m. up) and was lost, his ship being torpedoed later by a picket boat under Lt.-Comdr. Eric Robinson, to prevent it falling into the hands of the Turks. E14 (Lt.-Comdr. E. C. Boyle) followed, passing Chanak on the surface and running submerged for forty-four hours. She sank three ships, including the transport "Gul Gemel" with 6,000 troops, bringing her commander a V.C. AE2 (Lt.-Comdr. H. H. G. Stoker) made the passage on April 25, diving under the minefields, but on the 30th broke surface suddenly, and coming under fire was forced to the surface and sunk. On May 1 the French submarine "Joule" attempted the passage and succumbed to a mine. E11 (Lt.-Comdr. M. E. Nasmith) passed safely at the end of May, sank 10 ships, penetrated into the Bosporus and torpedoed the transport "Stamboul" and an ammunition ship there. Passing Kilid Bahr on his way back, her commander found a large mine perched in the bows which he dropped neatly by dipping and going astern, and won a V.C. in its place. E12 (Lt.-Comdr. Kenneth M. Bruce), E7 (Lt.-Comdr. A. D. Cochrane), E2 (Comdr. David Stocks), E20 (Lt.-Comdr. C. H. Warren) and H1 (Lt. Wilfred Pirie) followed, doing the same heroic work in difficult and dangerous waters. E14 was up again in July and sank 22 ships, great and small, including a 5,000-ton steamer on Aug. 7, and clearing the Sea of Marmora. He was assisted in this task by E11, who sank the old battleship "Hairredin Barbarossa" the same day and the transports "Chios" and "Samsoun" with the ammunition ships "Espahan" and "Tenedos" a week or so later. By this time a powerful barrage had been laid at Nagara, greatly increasing the risk of the passage. The French submarine "Marriotte" encountered an enemy submarine and was sunk (July 26) and E2 on her way in got badly entangled in the Nagara obstruction, but managed after 10 minutes' plunging about to get clear. E7 was not so fortunate. Going up on Aug. 4 she got enmeshed in the nets, and after the explosion of three mines in her vicinity was forced to the surface and sunk. E12, who followed in Sept., remained up 40 days with E20 and H1 in her company for a time and sank 37 ships. On the way down she fouled a net in the Narrows and went down to 245 ft., with the hydroplanes jambed and the conning tower flooded; finally she struck the chain moorings at Kilid Bahr which swept away the entanglement, and though she broke surface and came under fire managed to win through. The French submarine "Turquoise" was sunk by gunfire on Oct. 30 1915, and a final toll of British boats was taken in E20 (Lt.-Comdr. C. H. Warren) which fell a victim to stratagem after passing through the Narrows. With the help of an Allied code probably taken from a captured submarine she was inveigled to a rendezvous and torpedoed by UB14 on Nov. 6. E11 remained up a record period of 48 days in Nov. and Dec., sinking 46 ships of different sizes. The last submarine to make the hazardous passage was E2, which was recalled on Jan. 2, a week before the final evacuation, and got safely through.

For the latter part of the year 1915 two submarines had usually been working in the Sea of Marmora at a time. Altogether some 32 passages had been made or attempted by submarines, and though they had incurred the loss of 7 of their number (E15, AE2, E7, E20, "Joule," "Mariotte" and "Turquoise," their efforts had met with a large degree of success. The Sea of Marmora had been made unsafe, the Turks had been forced to send their troops by a roundabout route—by rail to Rodosti and then a three days' march to Gallipoli. Their tale of losses included two old battleships, one destroyer, 12 sloops and small craft, 7 transports, and no less than 197 vessels of all sorts and sizes, steam and sail, of which 36 were over 1,000 tons. This was the end of the Dardanelles submarine campaign, whose record fills a golden page in the annals of the navy.

In the autumn of 1915, when activity in British waters diminished, five more German submarines were sent to the Mediterranean. With them went Max Valentiner in U38 and Arnauld de la Perière in U35, two of the most distinguished German submarine commanders. The result was immediately evident. Valentiner, on his way from Gibraltar to Cattaro alone sank a round dozen of ships, including the Italian liner "Ancona" with a loss of over 200 lives, and the sinkings in the Mediterranean in Nov. went up to 23 chiefly off Crete, Malta and Tunis. They were nearly all merchant ships. No more men of war fell to them, and out of 242 transports only three were lost, the "Royal Edward" (Aug. 13, loss of life 955), "Ramazan" (Sept. 19) and the "Marquette" on Oct. 23. On Dec. 30 1915 Valentiner sank the P. & O. liner "Persia" (7,974 tons) off Crete without warning with a loss of 334 lives, but Germany refused to admit that it was one of her submarines and tried to transfer the responsibility to Austria. This brought the year 1915 to an end, a year fertile in hope and speculation, begetting vast promises of further success. To all Germany the future of her navy lay beneath the waters, though few could read the riddle as far as the bottom of Scapa Flow.

Types of German Submarines.—A short digression may be inserted here on the general types and characteristics of German submarines. They comprised four main classes—converted mercantiles (Deutschland class), U boats, UB and UC. The converted mercantile numbered a bare half-dozen (U151–U155) and were used chiefly off the Azores and in 1918 off the coast of America. They were about 213 ft. long, large, slow and clumsy, going about nine knots only on the surface, but capable of remaining out for three to five months. They had a good armament of two 5·9-in. guns, six torpedo tubes (4 bow, 2 beam) and 30 torpedoes. The U boats were the principal type, and were large boats which did most of their work in the Atlantic approaches. They were 210–225 ft. long, could go $14\frac{1}{2}$–17 knots on the surface, and 8–9 knots submerged. They could only maintain this speed submerged for an hour or so, but could continue at a speed of about two knots for as much as 48 hours; then, like all submarines, they had to come to the surface and recharge their batteries with the help of their Diesel motors. They carried two guns (usually one 4·1 in. and one 22-pounder), with 4 to 6 torpedo tubes and 8 to 12 torpedoes, and remained out generally from 25–30 days. There was also a special class of U minelayers, which originally numbered 10, viz. U71–U80, carrying 36 mines and 2 torpedoes. They had only a single hull and were slow boats, rarely cruising at more than 5 knots. Though the work on the west coast of Scotland and off the Dutch coast in 1918 was done by these boats they were not as a class very successful, and by 1918 there were only 5 of them left. The UB boats were originally built for coastal work, and the first 17 were small boats capable of being sent in sections overland. The earlier boats could remain out from 7–14 days, the later boats from 14–24 days. They carried one gun forward (a 4·1 in. or 22-pounder) and the earlier boats 2 to 6 torpedoes, which were increased to 5 tubes (4 bow, 1 stern) and 10 torpedoes in the later type. The UC boats were essentially minelayers, carrying one 22-pounder forward, 3 tubes with 4 to 6 torpedoes, and 18 mines. They remained out from 10–20 days in the North Sea, but when working in the Channel from Flanders rarely more than twelve. Submarines cruised normally on the surface. When attacking they usually proceeded at periscope depth (about 45 ft. for U boats), cruising at 65–85 ft., and going to 150 ft. if attacked. The fact that a periscope was rarely visible, even with glasses, at over a mile, emphasizes the difficulty of counter-attack.

German Submarine Flotillas.—The flotillas were distributed in four principal commands—the North Sea (or High Sea fleet) flotillas working from the Bight and usually termed the North Sea flotillas; the Flanders flotillas working from Zeebrugge; the Mediterranean based on Pola, Cattaro and Constantinople, and the Baltic (or Kurland) flotilla working from Baltic ports. The Flanders flotilla consisted wholly of UB and UC boats and was allotted a definite area of operations, which extended on the east coast of Great Britain as far as Flamborough Head (Yorks), and in the Channel as far as 7° W. (about as far as Waterford) and down to the Gironde. At the beginning of the year 1916 the strength of the various flotillas was approximately North Sea 16, Baltic 6, Flanders 18, Mediterranean 12. There were 16 boats approaching completion, and 161 boats building and being delivered at the rate of 8 to 10 a month.

Campaign of 1916.—The year 1916 was marked by another long-drawn-out controversy between the German Chancellor and the naval staff. The Chancellor stood out against unrestricted naval warfare (that is sinking at sight); the naval staff fought for it. Nor were their arguments lacking in force. If a submarine came to the surface at a distance a ship could run away, if it rose close at hand it was exposed to fire from an armed merchantman or decoy ship. In Jan. 1916 the German naval staff presented a memorandum claiming that unrestricted warfare would force England to make peace in six months. It stated that from Feb. to Oct. 1915 one or two steamers, averaging 4,085 tons, had been sunk daily by each submarine. This was an exaggerated estimate, for the figures for British ships in 1915 were more nearly one-third of a ship per submarine per day, but on this basis they calculated a loss of 631,000 tons a month, at which rate it was estimated that England would be reduced to her knees in six months. A definitive audience took place at Great Headquarters on March 6 1916, when it was decided to postpone its execution till April 1 in order to bring all possible means of persuasion to bear on the United States in the attempt to reconcile them to the idea.

Von Tirpitz, in despair at the continual frustration of his plans, resigned, and his place was taken by Adml. von Capelle. Five days before the prescribed date UB18 (Steinbrinck) torpedoed the "Sussex" on March 24 1916 on her way from Folkestone to Dieppe with 25 American citizens on board; and though she remained afloat, the forepart of the vessel was blown up and some 80 passengers were killed and injured. America's patience now came to an end, and on April 18 President Wilson threatened to break off diplomatic relations. The German Government gave way, and abandoning the idea of ruthless warfare issued an order on April 25 precluding submarines from sinking any merchant ship at sight, and requiring them in their war against trade to act in strict accordance with the methods prescribed by prize law, which entailed stopping a ship, examining her papers and giving all the crew and passengers an opportunity to leave her before proceeding to any act of destruction.

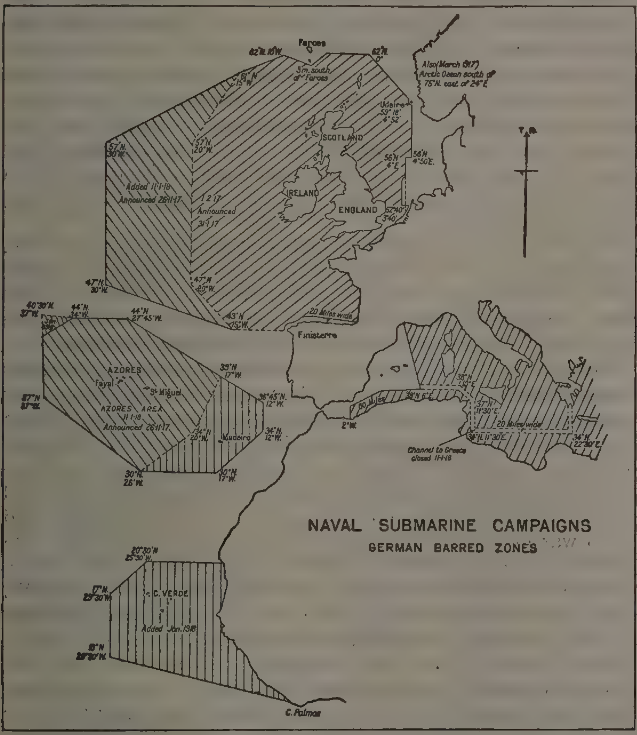
Meanwhile the chief of the naval staff at Berlin had issued an order, which came into force on Feb. 29 1916, that armed merchantmen were to be regarded as warships, and the attention of German submarine commanders was called to a clause in the prize regulations under which all merchantmen which might attack a German or neutral ship were to be regarded as pirates. This found its sequel on March 28, when Capt. Fryatt in his ship the "Brussels" attacked U33 on her way to Holland, and, being captured with his ship by a German destroyer on June 23, was tried and shot (July 27 1916).

The decision against unrestricted warfare came as a bitter disappointment to Adml. Scheer, who received the order on his way to carry out the Lowestoft raid on April 25 1916. He immediately recalled all the High Sea fleet submarines and ordered them to cease operations against merchant shipping. He refused to have anything to do with what he called the blunt edge of the weapon, and had decided that if they were not to be used in unrestricted warfare he would use them only in fleet operations. The Flanders command followed suit with most of its boats, and the Mediterranean flotillas were left to continue the campaign against commerce alone. Just as Adml. Scheer's order went out an extensive barrage was being laid off the Belgian coast (April 24) by the Dover Patrol (Vice-Adml. Sir Reginald Bacon). This was an effort on a large scale to cope with the submarine by a combination of mines and mine-nets. It consisted of some 18 m. of moored nets fitted with net mines, supported by lines of mines, running parallel to and about 12 m. off the Belgian coast. It was completed by May 7 1916 and a patrol was maintained on it by day from May to October. It is difficult to estimate its precise value, for the diminished activity ascribed to it at Dover was undoubtedly due to the cessation of submarine operations on political grounds from May to Sept. 1916. No doubt it made work more difficult for Flanders submarines, but the mines were poor and notoriously ineffective. A single boat (UB3) was destroyed in its vicinity the day it was laid by a lance bomb thrown from a drifter, the "Gleaner of the Sea." Another (UB10) ran into it and took eight hours to clear with net mines exploding all round her, and though the work entailed in the barrage deserves a generous meed of praise no submarine was actually destroyed by it in 1916, and it certainly never prevented the entry and exit of the Flanders boats.

Steinbrinck, of the Flanders flotilla, was now sent to cruise in the Channel to report on the feasibility of warfare on the lines of prize law, which involved the stoppage and due warning of ships before destruction. His report was unfavourable, and during the summer the Flanders boats worked only on the E. coast. Scheer meanwhile used his Bight flotillas (reinforced with Flanders boats) in fleet operations, of which the most important were those of Jutland and Aug. 19, when the "Nottingham" and "Falmouth" were sunk by U52 and U66. It was on this latter occasion that E23 (Lt.-Comdr. Robert Turner) torpedoed the German battleship "Westfalen" on its way out of the Bight. This was at 5:30 A.M., and on rising to the surface later at 10:10 A.M. he reported the German fleet to the C.-in-C., then some 180 m. off, an incident which first brought into prominence the possibilities of the submarine in fleet reconnaissance work. During the summer the chief of the German naval staff was trying to persuade Scheer to modify his "harsh professional conception" of submarine warfare, and resume restricted war against commerce in accordance with prize law. The Mediterranean submarines had continued working on these lines with good results; the Flanders flotilla had recommenced on a small scale in Sept. 1916, and the operations in concert with the fleet had only resulted in the sinking of two light cruisers. The "Deutschland," under Capt. Paul König, tried a trading venture across the Atlantic during the summer, reaching America on July 9 1916 and returning on Aug. 23 with a cargo of rubber, nickel, and tin, but the "Bremen" which followed her in Sept. was lost. U53, under Lt.-Comdr. Hans Rose, a skilful and chivalrous commander, crossed the Atlantic (leaving on Sept. 17 and arriving on Oct. 7) and sunk five merchantmen off Newport News. The "Deutschland" made a second trip across, arriving in New London on Nov. 1 and reaching Germany safely on Dec. 10 1916. There her mercantile career ended, and she was fitted out as a submarine-of-war and went off to work in the Azores. Archangel too became a sphere of activity for a time, and seven ships were sunk there in Oct., but the initial success did not continue, and in Nov. U56 was sunk by Russian patrols. The German naval staff now decided that all flotillas were to resume the campaign against commerce in accordance with prize law, and orders to this effect were issued on Oct. 6 1916. Scheer had underestimated the power of legitimate warfare. The monthly average of all Allied and neutral merchant ships sunk by submarines had been 76 ships and 153,521 tons (gross) from Feb. to Sept. 1916. From Oct. 1916 to Jan. 1917 the average rose to 173 ships and 346,405 tons, and the campaign was extended with success to the Azores, Canaries and Madeira, where Funchal was bombarded on Dec. 3 by a converted mercantile.

"Unrestricted" Warfare, 1917.—But during the autumn Scheer and the naval staff found powerful allies for the policy

of unrestricted warfare in Hindenburg and Ludendorff. The topic was again discussed on Sept. 3 1916 at Great Headquarters at Pless in the presence of the Chancellor, Hindenburg, Ludendorff and Adml. von Holtzendorff, and it was finally decided to postpone it till an effort had been made to come to terms. Then followed the note of Dec. 12 1916 calling on the Allies to avoid further bloodshed, and on Dec. 22 the naval staff presented another memorandum in which it was hoped to reduce British shipping by 39% in five months, on a basis of 600,000 tons monthly, an estimate which turned out to be excessive, for by June 1917 British shipping had been reduced only from 18·2 to 16·6 million tons, a reduction of only 9·1%. The offer to negotiate was rejected by the Allies, and it was decided on Jan. 9 to commence unrestricted warfare on Feb. 1 1917. All Germany was waiting for the decision. The Reichstag listened to the Chancellor's announcement in breathless silence, and on Feb. 3 the American ambassador left Berlin. Germany now had 148 submarines, of which 28 were in the Mediterranean and some 20 in Flanders. She had commenced with 28 and had lost 51. The repairs incurred at Jutland, the provision of patrol vessels and the vacillations of policy had reacted on submarine building, and von Capelle had only laid down 90 boats to Tirpitz's 186, but during 1917 269 more were ordered and it was hoped to keep pace with the demand. The barred zone announced by Germany on Jan. 31 1917 in which all shipping was liable to be sunk extended roughly from Terschelling (Holland) to Udsire (Norway), thence to the Faroe Is. and passing down the meridian of long. 20° W., 350 m. from the coast of Ireland, went on to Finisterre. It also included the Mediterranean with the exception of its western portion round Majorca and a narrow track 20 m. wide as far as Greece. The area round Archangel was added to it in March 1917, and on Jan. 11 1918 it was extended to the meridian of long. 30° W., 720 m. from the coast of Ireland, and two large areas were added round the Azores and C. Verde Is.



NAVAL SUBMARINE CAMPAIGNS
GERMAN BARRED ZONES

The effects of the new campaign were quickly felt. The system under which traffic approached Great Britain on routes patrolled by ships and trawlers with a sprinkling of destroyers proved incapable of meeting the emergency. Losses of Allied merchant ships rose from 171 in Jan. to 234 in Feb., 281 in March and 373 in April. This was the black month of the war. At this rate one ship in every four that left British shores did not return, and by Nov. 1917 the irreducible margin of shipping would probably have been reached. The effects were most severely felt in the Channel, Mediterranean and the routes south of Ireland (called the Fastnet and Scilly approaches), which were strewn with the hulls of sunken ships. The outlook was dark and perplexing to those who saw the Grand Fleet remaining mistress of a sea which was becoming a cemetery for British shipping, and had not realized the fact that the battle fleets were becoming subsidiary factors in a new form of the *guerre de course*. The efforts to deal with the situation took a threefold form. Firstly, a convoy system (*see* CONVOY) was introduced involving the escort of merchant shipping at sea and the control of all shipping movements; secondly, the naval staff was reorganized so as to insure a due status for the convoy system, and a planning section and anti-submarine division were added to it (*see* ADMIRALTY ADMINISTRATION); thirdly, invention and research were speeded up in the technical fields of mines, depth charges and hydrophones. These efforts were successful. Gradually the losses of ships went down and the losses of submarines crept up.

The enemy's operations can only be broadly described; his principal areas were the approaches to the Channel and Irish Sea, the North Sea (particularly off the Yorks. coast), the Channel and Mediterranean. The number of submarines operating varied. As a rule there might be two or three (converted mercantile) operating in the Azores and on the Dakar (W. Africa) coast, 8 or 9 U boats in the Atlantic approach (from longitude 7° to 12° W.) and on their way there and back, 4 or 5 (including a couple of Flanders UC) in the Channel and its approach, with 5 UB (Flanders) and 2 UC (Flanders) in the North Sea. In the Mediterranean there were usually 4 to 6 submarines at work, including 1 or 2 on the N. African coast, 1 or 2 round Italy, 1 perhaps off Salonika, 2 off Egypt, Syria and Crete. This gives a total of some 25–30 submarines at work. The tonnage sunk per submarine varied. Curiously enough the average bag was considerably more in the time of restricted warfare than it was in 1917–8. In the former period it was probably something like 16,000 tons a trip. U49 on her first trip in Nov. 1916 in the Channel and Bay of Biscay sank 40,000 tons, and Forstmann, Arnauld de la Perière and Max Valentiner in the Mediterranean thought little of 20,000 tons a trip in 1916. But in 1917 the average bag was probably not much more than 8,000 tons for a U boat and 3,000 for a UB or UC. In the North Sea in Jan. 1918 a U boat was fairly fortunate to get 4,000 tons, and in the Channel 6,000 tons had become a fair bag.

Progress of Counter Measures.—In the anti-submarine campaign great progress was made in technical devices, and larger depth charges were supplied in greater quantities. Type D charge (300 lb. T.N.T.) entirely superseded type D^x (120 lb.), and the output was increased. Destroyers carried five or six instead of one or two; some were equipped with as many as 20 or 30, and the number of submarines sunk by depth charges rose from 8 in 1917 to 15 in 1918. Decoys (generally designated Q ships) continued effective in 1917, and five submarines were sunk by them during the year. These were merchant ships manned with a trained crew and armed with guns carefully concealed by special devices. On a submarine opening fire the ship would stop and a portion of the crew called the "panic party" took to the boats, lowering them carelessly and hurriedly in the hope that the submarine would approach and board the vessel. If she did the bulwarks fell and a deadly fire was poured into her at close quarters. Capt. Gordon Campbell was the most successful exponent of this stratagem. U38 fell to his ship, the "Pargust," on Feb. 17 1917 off the southwest of Ireland, and UC29 was sunk by her on June 7 in the same area, bringing him a V.C. His last ship, the "Dunraven," sank on Aug. 10 after a heroic action with U61, in which the after gun's crew remained steady at their post with the poop blazing under them and were blown up with the gun rather than betray the nature of their ship. The "Prize," (Lt. Wm. Sanders) and the "Stonecrop" (Comdr. Morris Blackwood) were also gallant ships, the former sinking U88 out in the Atlantic on Sept. 17 and both being sunk by submarines. By Sept. 1917 the decoy had lost its efficacy, though four were still in use in the early part of 1918. From first to last it achieved the destruction of 13 submarines with the loss of some 20 decoy ships, great and small, some like the "Prize" and "Vala" with all hands. Its place was now taken by the seaplane and P boat. The latter were low boats not easily seen in mist or at dawn and were responsible for no less than four submarines in 1917. Aircraft now began to be really effective, and in 1917 six submarines succumbed to the 300-lb. bombs of large Handley-Pages in the southern portion of the North Sea. British submarines too were constantly on patrol, and were able to count six submarines to their credit by the end of the year (G13 sank UC43 off the Shetlands March 10; E54 U81 in the Atlantic May 1; D7 U45 north of Ireland Sept. 12; E45 UC79, Oct. 19; E52 UC63 Nov. 1, in the North Sea, and C15 UC65 Nov. 3, in the Channel). The hydrophone, an instrument designed to detect submarines by sound waves under water, also developed greatly, but was more useful as a detector and in controlled minefields than in actual pursuit.

The whole system of staff work was overhauled. Direction of convoys became one of the principal functions of the naval staff and the machinery of Intelligence was adjusted in this light. Intelligence of first-rate importance derived from wireless directionals had hitherto been shrouded in secrecy and locked away in drawers for the edification of the very few. The director of Naval Intelligence (Rear-Adml. Sir W. R. Hall) at last obtained control of it, and spread it abroad and circulated it to every command. The movements of all enemy submarines hitherto veiled in secrecy were displayed on a great chart in the Convoy room, and subjected to careful analysis by the new Plans Section. In Oct. 1917 this division prepared a large mine-net operation based on careful observation of submarine tracks in September. In spite of bad weather and unfavourable circumstances three large submarines (U50, U66 and U106) found their way into the minefield and were sunk, causing a scare in the Bight which sent submarines round by the Kattegat for the first time.

Plans were prepared too for mining the Bight, but it was not till Sept. 1917 that the new mines were ready in sufficient quantity. Gradually the whole strength of the High Sea fleet had to be concentrated on getting submarines in and out. An armada of minesweepers, barrier breakers, escort forces and outpost forces were constantly at work trying to keep a passage open for them along ways which extended as far as 150 m. from Heligoland. Dover still remained a thorn in the flesh. The cessation of submarine activity in April 1916 had been erroneously attributed there to the Belgian coast barrage, and a similar barrage had accordingly been laid across the Straits in the latter part of 1916. It was composed of mine-nets 60 ft. deep with a minefield in support. But the mines were of the old defective design. They dragged into the nets, sank British ships, and had to be swept up in June and July 1917. The barrage entailed enormous labour but did not close the Straits, and from Feb. to Nov. 1917 enemy submarines passed at the rate of at least 24 passages a month. This was a serious matter, for the Dover passage saved a Flanders boat eight days on the double journey to the Channel approach out of its trip of 14 days, and a Bight boat six days out of its trip of 25 days. In Oct. the whole question became acute, for Flanders boats were responsible for some 22 ships a month in the Channel. The proper antidote was a strong minefield, and the vice-admiral at Dover had suggested in July 1917 laying a deep minefield from the Varne to Gris Nez, but the new mines were not ready and could not be supplied to Dover till Nov. It was partly laid on Nov. 21, but it was not constantly and intensively patrolled so as to make the submarines dive, with the result that between Nov. 21 and Dec. 8 21 submarines made the passage in safety. This was a severe disappointment, and instructions were sent to establish a strong patrol equipped with flares and searchlights to force the submarines down. This was done to a limited extent, and on the 19th the new minefield took its first toll in UB56. But difficulties arose in the execution of the plans and the urgency was so acute that before the end of the month Rear-Adml. Sir Roger Keyes, Director of Plans, was sent to Dover to assume the command, and the next four months saw nine submarines destroyed in the Dover area. By Feb. 1918 the Bight boats had ceased to use the Straits, and by May the activity of the Flanders boats in the Channel had been enormously reduced; the blocking of Zeebrugge contributed to this result, and the losses in the Channel were reduced to six a month, the minefields laid by the Flanders boats falling from 404 in 1917 to 64 in 1918.

The year 1918 saw the commencement of a much more ambitious scheme—the Northern Barrage—which aimed at nothing less than mining with 120,000 mines the huge stretch of 240 m. between the Orkneys and Norway. (*See* MINESWEEPING AND MINELAYING.) This was really an immense task, complicated by a deep gut some 60 m. wide on the Norwegian side where the depths ran to 150 fathoms. The credit for its conception and execution lies largely with Adml. Sims and the U.S. navy. It was an American enterprise performed by American sailors in American minelayers. As it was only commenced in April and was barely completed in Oct. its value is difficult to appraise, but the loss of some half-a-dozen boats can be attributed to it in Sept. and Oct. 1918. United States destroyers too were doing invaluable work in escorting convoys, and had been doing it ever since May 1917, during the dark months of 1917 when destroyers were more valuable than battleships.

The losses in the Mediterranean had given rise to serious concern, and the First Lord (Sir Eric Geddes) and the director of Naval Intelligence proceeded there in person to arrange for an extensive reorganization of the commander-in-chief's staff. Its clear waters, too deep for mines, and its regular tracks had been an ideal hunting ground for submarines. During 1917 only two German submarines had been lost there, and in the black month of April 1917 the Mediterranean had supplied one-fifth of the tonnage sunk. The arrival of some 14 Japanese destroyers in the summer brought the losses down about 10%, but in Dec. 1917, when vigorous action had greatly reduced the losses at home, the Mediterranean was still contributing 147,000 tons a month or over one-third of the whole. The convoy system was now introduced in the Mediterranean, the Otranto barrage was established and reinforced, and in May 1918 no fewer than four submarines were destroyed there. The effect of these measures was soon felt. Our losses in that sea were reduced from 95 ships a month in the last quarter of 1917 to an average of 43 in July, Aug. and Sept. 1918.

The U-boat zone had been extended to the Azores in Nov. 1917, and one or two boats had been working regularly there with fair results and comparative immunity till May 11 1918 when U154 was torpedoed by E35 about 150 m. west of Cape St. Vincent, an exploit directly due to improved intelligence.

Adml. von Capelle had been confident that his submarines would be able to prevent the U.S.A. troops reaching Europe, but actually not a single transport was lost up to Feb. 5 1918, when the "Tuscania" was torpedoed with a loss of only 44 lives out of 2,404. To stop the ceaseless flow of troops four large submarines were sent across the Atlantic, but though they destroyed over 60 ships they did not get a single loaded transport, and U156 was lost in the Northern Barrage on her way home. On July 19 1918 the great liner "Justicia," 32,234 tons, was hit by a torpedo from UB64 at 2:30 P.M. off the Skerryvore (Scotland, W. coast), and attacked again by U54 and UB124 the next morning. A whole armoury of depth charges was dropped round UB124 by the "Marne" and other destroyers, forcing her to the surface to surrender. All this time the mining of the Heligoland Bight went steadily on with the help of the gallant 20th Destroyer Flotilla (Capt. Berwick Curtis), and its exits were occasionally entirely closed. The Flanders flotilla felt the full force of the increased activity at Dover and suffered heavily. In Jan. 1918 it numbered 29 boats; it lost no less than 24 during the year and its strength dropped to 13. By the middle of 1918 it had earned the dread name of the "Drowning Flotilla," and its boats could reckon on a life of only three or four trips.

The Kattegat still remained open. In April 1918 a deep minefield was laid there, and had it been possible to keep it patrolled the submarines would have had to face another serious danger. How far this was practicable is a moot point.

The reports of destruction in 1918 gradually began to fall into four categories. Either a mine demolished the boat wholesale, or an aeroplane swooped down on it with 300-lb. bombs, or a volley of depth charges forced it to the surface, or a torpedo from a British submarine brought its career to a sudden end. Depth charges competed with mines as the principal instrument of destruction (destroyers and patrols 39%, mines 30%); then came the submarine 8%, with aircraft a bad last.

It is impossible to narrate the long story of destruction. UB81 may be mentioned as an example of the unenviable career of a German submarine. On her way down Channel on Dec. 2 1917 she struck a mine off the Owers (near Portsmouth) and water began to enter by the stern. An attempt was made to bring her to the surface, but the after-tanks would not blow and her stern sank to the bottom in 90 feet. The gauges showed the bows to be out of water, and with the boat lying at an angle of about 60° a torpedo was lowered from the bow tube, and a man rammed up its narrow length. The sea cap was opened cautiously and it was found that the mouth of the tube was a couple of feet above water. Men were rammed carefully up and seven men had dragged themselves painfully out, only to find the cold so bitter and the strain so great that most of them elected to go back and join those who were seeking oblivion and death in the oxygen flasks. P32 patrolling in the vicinity saw the bows above water, but in the endeavour to get alongside the wind and waves bumped her against the submarine, which went to the bottom, leaving only a solitary survivor. Two little drifters contributed their quota to the tale. On April 17 1918 a little drifter, the "Pilot Me," whose jolly name was in itself an omen of success, working in the North Channel, suddenly sighted the periscope of UB82, 150 ft. off, and turning quickly dropped four depth charges on it. The submarine came up at an angle of 45°, and three other drifters, the "Young Fred," "Look Sharp" and "Light," all opened fire on her. She went down and the "Young Fred" dropped four depth charges on her, bringing her to a final end.

Statistics of Submarine Warfare.—The dreary dreadful tale of ships sunk and attacked is too long to give (for dates and names see *Admiralty Return of British Merchant and Fishing Vessels Captured or Destroyed*, Aug. 1919, H.C. 199). It includes the names of nine hospital ships, all, with one exception, large ships whose character was unmistakable ("Asturias" March 20 1917, Channel, beached, 44 lives lost; "Gloucester Castle" March 30 1917, Channel, towed in; "Donegal" April 17 1917, Channel, sunk, 41 lost; "Guildford Castle" April 10 1917, Bristol Channel, hit by dud torpedo; "Lanfranc" April 17 1917, off Havre, with 167 wounded Germans, sunk, 34 lost; "Dover Castle" May 26 1917, Mediterranean, sunk, 7 lost; "Rewa" Jan. 4 1918, Bristol Channel, sunk, 4 lost; "Glenart Castle" Feb. 26 1918, Bristol Channel, sunk, 95 lost; "Llandovery Castle" June 27 1918, Atlantic). Of these the attack on the "Llandovery Castle" by U86 (Patrig) was probably the most flagrant breach of the principles of humanity. She was homeward bound from Canada 116 m. from the Fastnets (S.W. point of Ireland). The enormous red cross of a hospital ship was lit on her side, glowing in the twilight like a lustrous jewel, when she was attacked and sunk; of the 258 persons on board, including 14 nurses, all except a boatload of 20 perished.

* (Including losses by surface craft and mines.)

In Oct. 1918 Flanders was evacuated and the remains of the flotilla blown up. It was a Flanders boat UB116 (Lt. Emsmann) which made a last desperate effort to enter Scapa on Oct. 28. It was heard on the hydrophones, and seen for a moment in the search-light beam. Then came the heavy shock of an explosion and the last of the Flanders flotilla found a fitting end in the very gates of the enemy.

When the Armistice was under discussion, Scheer, who was now chief of the German naval staff, recalled all the submarines, intending to make use of them in a last desperate sortie with the fleet, but he found himself suddenly confronted with mutiny, and the fleet never sailed, though the submarines remained true. Meanwhile in the British navy the evolution of the submarine had followed a different path. Here there was a tendency to produce a type useful in reconnaissance work and able to act in tactical conjunction with the fleet. Of E class, which did yeoman service, 49 were built and 27 lost. They were vessels of 180 ft. long with three to five 18-in. tubes and a speed of 15 knots on the surface and 10 submerged. They were followed by G class (10 built in 1916, 4 lost) with better seagoing qualities and double hulls, armed with one 3-in. anti-aircraft gun and 5 tubes (four 8-in. and one 21-in. astern); their speed was 14 and 10 knots. Of J class 7 were built in 1916–7 and 1 lost. They were 270 ft. long, carried one 4-in. and six 18-in. tubes and could do 18 knots on the surface. K class were designed for fleet work, and were completed in 1917–8 (16 built, 3 lost). They were steam-driven on the surface, attaining a speed of 22 knots, 334 ft. long, and carried one 4-in., one 3-in. A.A. gun and eight 18-in. tubes. L class carried one 3-in. A.A. and six 21-in. tubes. They were 222 ft. long with a surface speed of 17 knots. Some 25 were complete in 1918 (2 lost). Of M class only 4 were ordered. They were about 200 ft. long and carried a single 12-in. 35 calibres gun which could be fired only in the direction of the bow. The design was "freakish" and displayed a lack of tactical, strategical sense. Only one was completed. R class, of which 12 were completed (none lost), was specially designed for anti-submarine work. They were short and built for quick diving and rapid manœuvring. They carried one 3-in. gun and four 18-in. tubes. Of British submarines 54 were lost during the war:—

The question arises, How nearly did the German submarine campaign attain its aim? The increase in submarine destruction and the decrease in shipping losses possess little meaning apart from the figures of output in either case. In spite of strenuous

British effort the German submarine output more than kept pace at first with their destruction. In 1917 the net gain in submarines was approximately 45, but in 1918 the two exactly balanced (74 added, 74 lost). The shipping position depended largely on the irreducible margin which would have fulfilled British needs. This may be taken as 12½ million tons, and in addition there was always some 600,000 tons of British shipping under repair (from enemy and marine damage), requiring a total of, say, 13,000,000 tons (gross). By the end of 1918 there were 3,391 British steam vessels of over 1,000 tons, with a gross tonnage of 14,049,000.

The British shipbuilding capacity remained much the same (about 1·2 million tons a year, 1·310 million tons gross for Jan. to Oct. 1918), but net losses had been reduced to about 33,000 tons gross per month, which meant that the submarine could no longer attain its object within a reasonable time. It is true that the German output of submarines would have increased 20 or so monthly in 1919, but there is every reason to believe that the Allied navies could have dealt with it. The really critical time from Aug. 1917 to Dec. 1917 had passed. The submarine campaign had failed. On three grey Nov. days they filed along Germany's *via dolorosa* towards Harwich, bringing to a grim and sordid conclusion one of the most tremendous chapters in the history, not only of naval warfare, but of the world.

Final Tale of German Submarines in Nov. 1918.

SUBMARINE MINES (*see* 26.1).—It was the Russo-Japanese War 1903–4 which saw the first use of what has been called deep-sea mining—that is to say, the application of the submarine mine to strategic and tactical uses quite distinct from its previous application for coast defence; and that war led to the intensification of development in all maritime countries.

In the World War 1914–8 Great Britain laid a total of 130,389 non-controlled mines, 1,192 controlled mines and 25,983 of a small special type of net mine; in addition, 899 British non-controlled mines were laid by a U.S. minelayer. As showing the growing intensity of mining as the war developed, British minelayers were engaged on an average number of days in each month of 2½ in 1915, 5¼ in 1916, 11 in 1917, and 20 in 1918. A mine barrage across the Dover Straits contained 9,373 mines. The great Northern Barrage from the Orkney Is. to the coast of Norway contained 69,766 mines; of this number 56,033 were American mines and laid by the U.S. minelayers. The British minelayers, who were chiefly employed elsewhere, laid the remainder. British submarines laid 2,469 mines. (*See* generally MINELAYING AND MINESWEEPING.)

The chief naval war losses in surface ships due to the action of mines were:—

	Battleships	Cruisers	Destroyers and Torpedo Boats
Great Britain	5	3	22
France	1	1	5
Russia	1	—	6
Italy	1	—	2
United States	—	1	—
Japan	—	—	1
Germany	—	2	20
Austria	—	—	3
Turkey	—	2	—

Mines, as distinct from depth charges, accounted for the known loss of 35 German (or Austrian) submarines.

The loss of the British mercantile marine due to mines was 673,417 gross tons, besides a loss in fishing vessels of 8,545 gross tons.

Classification of Mines.—Submarine mines can be divided into two general types, controlled and non-controlled. These may be again divided, each into two divisions, contact and non-contact, and these may be further sub-divided into three classes, moored, drifting and ground. A ground mine is one which is laid actually on the bottom; it is chiefly useful in shallow waters. Drifting mines may be submerged and oscillate between set depths, may float on the surface, or may be suspended below a float; they are especially suitable for employment in river warfare. A moored mine which is the type most frequently used, is a buoyant mine anchored to the bottom by a heavy weight or "sinker," the mine being attached to its "sinker" by chain or wire rope. The "sinker" may be automatic in its working and, following an adjustment which is capable of being readily made by the layer, it will take the mine to the desired depth below the surface. The depth adjustment will be made by the layer in accordance with the draft of the enemy's ships.

Controlled mines are those which have their firing source outside the mine and directly controllable by human agency. An electric current, provided by a dvnamo or battery, is conveyed to the mines by cables led along the sea bottom from a control station on shore where the current may be switched on or off as desired. In the case of contact controlled mines a break in the controlling circuit, inside the mine, is completed when the mine is struck. Sometimes this is arranged by the crushing of a horn or it may be arranged by mechanism which acts due to the inertia of the blow. In the case of non-contact controlled mines, the firing is accomplished either by the direct observation of the operator or the mines themselves are made their own observers. In the first case the observer follows the enemy vessel through a telescope, which works over a prepared chart having metal strips on it corresponding to the positions of the mines; when a plunger on the training arm attached to the telescope comes into contact with one of the metal strips, the circuit is completed to that particular mine or line of mines and the mines are fired. Where the mines are their own operators, each contains mechanism, such as a microphone, which will pick up the sound of a ship's propellers and will indicate to the operator the moment when he should fire. The observation current from the mine is conveyed to the operator by the same cables that are used to fire the mine.

Controlled mines are specially applicable to the defence of harbours, where, by nature of their control, passage of friendly ships can be permitted but, at any time if necessary, can be denied. Contact controlled mines are used chiefly in side channels, because, although they can be put to "safe," they nevertheless foul the ground and friendly ships passing might damage them or tear them from their moorings; used channels have, therefore, to be mined with non-contact controlled mines, moored at a depth below the draft of the deepest draft ship using the channel.

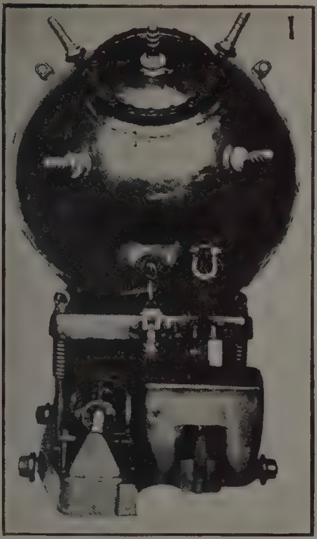
Controlled mines are very costly to install and maintain and they require a large personnel to tend and operate them. (*See* PLATE, figs. 6 and 7, for types of non-contact controlled mines.)

Non-controlled mines are those which are automatic when once laid. They carry their own firing source or obtain it from the sea and have no further dependence on any human control. Mechanism is usually fitted which renders them safe during laying and for a short time afterwards, or at any time should they break adrift from their moorings. They may also be fitted with mechanism rendering them safe or disposing of them by explosion after a determined interval, and unless so fitted they must be swept up when no longer required.

There are several methods by which contact non-controlled mines are fired:—(i.) Inertia, where the momentum of the blow displaces a weight or pendulum inside the mine, causing the release of a percussion firing mechanism. (ii.) Mechanical lever, where the contact with a vessel displaces a rod or lever on the outside of the mine which first cocks and then releases a percussion firing mechanism. (iii.) Hydrostatic, where the contact with a vessel admits water, usually by the crushing of an external horn, into a valve inside the mine, which acting under the water pressure releases percussion firing mechanism. (iv.) Electrical, which is usually of the well-known "Hertz" horn type, where contact with a vessel crushes an external horn which contains within it a bichromate solution in a glass tube. When the glass of this latter is broken, the solution flows to the plates of an electric battery, previously inert, situated within the mine at the base of the horn. The solution energizes the battery, which is electrically connected to the mine detonator, thus firing the mine. This type, though electrical in action, carries the energy in a chemical form.

In the case of non-contact non-controlled mines, firing can be accomplished by an observing mechanism, as for instance a microphone, within the mine; as a vessel approaches, the sound of her propellers is picked up by the microphone and by means of relay mechanism the mine can be made to fire when a pre-determined intensity of sound has been reached.

SUBMARINE MINES



1

8

Figs. 1 and 2 show contact non-controlled mines having the horn type of firing mechanism and attached to their automatic sinkers as they would appear on board the minelayer when ready for laying. The small wheels on each side of the sinkers at the bottom engage on the rail track laid along the minelayer's deck.

Figs. 3 and 4 show similar types of mines as they would appear when broken adrift from their moorings and floating on the surface.

Fig. 5 shows a special type of horned contact non-controlled mine adapted for discharge out of a torpedo tube of a submarine.

Figs. 6 and 7 show types of non-contact controlled mines as they would appear when broken adrift from their moorings and floating on the surface.

Fig. 8 shows the explosion of a depth charge fired at a depth of 40 feet.

The object of such an arrangement is to increase the probability of the mine, but since in this case the mine is fired out of actual contact with the ship's hull, explosive effect is sacrificed for the gain in probability, a failing common to all types of non-contact mine. (Various types of non-controlled mines are shown in the accompanying Plate, figs. 1–5.)

Minefields.—Controlled minefields, on account of the complicated nature of material, etc., are applicable only to a limited defence of friendly shores. The mines are usually laid by small special minelayers in short lines or small groups, all the mines of a line or group being fired simultaneously where these are of the non-contact type.

Non-controlled minefields on the other hand are required on an extensive scale and in all depths of water, both for offence against the enemy and defence of friendly coasts. They may consist of "barrages" to prevent the passage of enemy vessels through definite and particular areas, "independent minefields" to inflict loss on the enemy where there is a reasonable possibility of doing so, and "mined areas," which are built up of individual minefields to inflict loss on the enemy in areas which he is obliged to use when his ships put to sea for operations or exercise. Mines are laid in lines which are either continuous or broken up into groups, but variations of a single line are more often used, especially when several minelayers are taking part in the operation together, the more usual variations being two or more parallel lines, single indented or stepped line and dog's leg line.

There are also some special forms of mining, such as the laying of "connected mines" where two or more non-controlled mines are connected together, or where, as an anti-submarine measure, the mines are suspended in nets. The object of all such systems is to increase probability, but the latter is only gained, in these cases, by complication of the material and the laying of it out.

Minelayers.—Various classes of vessels are employed for laying non-controlled minefields:—(*a*) Large minelayers with large carrying capacity for laying "barrages." (*b*) Fast minelayers of moderate capacity for laying "mined areas" or "independent minefields" in enemy waters. (*c*) Very fast minelayers and submarine minelayers for laying small minefields close in to vulnerable points.

Submarine minelayers require special laying apparatus. Surface minelayers are usually provided with narrow-gauge rails running along the deck and ending in a discharge "trap" at the stern. The "sinkers" have two pairs of wheels which fit the rail gauge and each mine rests on top of its own sinker. The mines and sinkers are disposed in long tiers along the rails and as the minelaying proceeds the tiers are gradually hauled aft towards the traps, electrical power being usually employed for this purpose. On nearing the "trap" each "unit" is hauled off the face of the tier in succession and pushed into the "trap" from whence it is let go by order.

The spacing of the mines apart varies according to circumstance, but the least distance at which mines can be spaced apart is limited to the distance at which one mine, if exploded, will not damage or countermine the next adjacent. The spacing on board the minelayer is regulated by time; the interval between successive mines being let go varies according to the speed at which the vessel is steaming and the spacing being used. Where a minelayer has more than one set of rails, it is usual to drop mines alternately from each set; this is for convenience and gives more time for the loading of each "trap." (H. D. B.)

Depth Charges.—A development of submarine mines which came in during the World War is the engine known as a depth charge. This, as its name implies, is a charge of explosive which is detonated on reaching a given depth.

The explosive is carried in a mild-steel plate "charge case," to which rings are secured at the top and bottom for handling. A primer for detonating the main charge is secured in the centre of the charge case, round which primer lies the great bulk of the explosive charge and immediately above the primer is secured the "pistol." The pistol is arranged to fire the charge at varying depths.

One principle by which a depth charge may be fired consists of admitting water to a chamber containing a hydrostatic diaphragm. The pressure of the sea-water acts on the diaphragm and at the set depth causes a striker to act, thereby exploding the charge. A suitable safety arrangement is of course provided, and this consists of a safety key which cannot be withdrawn until the depth charge has been adjusted for a depth setting.

Depth charges are carried in the stern of vessels, either in chutes or on a tilting tray, and can be released either hydraulically from the forebridge, or by hand. As the depth charge sinks at a rate of 10 ft. per second, it is clear that the laying vessel must maintain a certain minimum speed to ensure herself against damage by the depth charge she has dropped. This is 10 knots.

In addition to the two methods of carrying and dropping depth charges already mentioned, an alternative is provided in some ships in the form of a depth charge thrower. This consists of a steel barrel and an "expansion chamber." Into the expansion chamber is screwed an explosion tube which on firing sets up a pressure which will throw the depth charge a distance of 40 yds. with a time of flight of four seconds.

The introduction of the depth charge was brought about in 1915 owing to the complete immunity enjoyed by a submarine immediately on submersion, notwithstanding the knowledge of a surface vessel that the submarine was in its immediate vicinity. The introduction and rapid development of the depth charge entirely removed this sense of security, and quite apart from the destruction of 34 submarines actually achieved by this means, it produced a very great moral effect upon hostile submarines, and hampered them in attacks upon surface craft, owing to their perception of the risk of allowing their periscopes to be sighted, and thus drawing down a rain of these depth charges upon them.

Though depth charges generally cannot be depended on to vitally damage a submarine outside a range of about 30 ft. (depending on the weight of the charge), the effect on the nerves of a crew of a series of heavy explosions at a greater distance than this fatal limit is very marked, and may be regarded as one of the great uses of this weapon. In many cases in which British submarines have been subjected to a depth charge attack, the force of the explosion has caused an immense concussion inside the boat. Fig. 8 in the accompanying Plate shows the explosion of a depth charge at 40 feet. (B. A.)

SUDAN (*see* 26.9).—The countries of the western and central Sudan are treated under their distinctive names; the present article deals with the Anglo-Egyptian Sudan, which, following official usage, is called the Sudan simply.

The area administered by the Sudan Government, enlarged during 1910–6 by the addition of the Lado Enclave and Darfur, was officially given in 1921 as 1,014,000 sq. miles. In the same year the pop. was estimated at over 4,000,000, which compared with an estimate of 1,853,000 in 1905. Nearly half the people are primitive negroid tribes living in the equatorial belt. Khartum, including Khartum North, had 39,056 inhabitants in 1921; Omdurman 59,429.

Economic and Social Conditions.—The years 1910–2 were years of prosperity, so much so that in April 1912 Lord Kitchener declared that "there is now hardly a poor man in the Sudan." But in that year the country experienced low floods and poor rains, while the 1913 Nile flood was one of the lowest on record. The rains, scanty at the best, failed altogether in some districts. The result was that 1913 and 1914 were years of acute agricultural and trade depression—1914 was described as perhaps the most difficult, from the point of revenue and the economic situation, experienced in the history of the Sudan. Trade suffered another shock with the outbreak of the World War. Abundant rains in the autumn and a high Nile happily resulted in providing the country with an ample supply of food-stuffs. Yet 1915 was little better than 1914. War conditions and the scarcity of shipping had caused a much lessened demand for the produce of the country. The cultivators, who form the majority of the people, "while they had enough to eat, were short of ready money" and hard pressed to pay their taxes. European conditions were indeed closely reproduced in the Sudan so far as commerce and economics were concerned. This was seen in 1916 when a period of comparative prosperity set in, though this was also due in part to abundant rains and a good flood in 1915. "The influence of the war," said the official report issued in 1920, "which had had such a depressing effect on trade in 1914 and 1915, began to operate in the reverse direction, and a great impetus was given to the export trade through an unprecedented demand for Sudan products. The presence of a large body of British troops in Egypt requiring grain and live stock, the demand created on the Arabian coast for Sudan millet, and in England and Allied and neutral countries for cotton and gum enabled all these commodities to be disposed of freely."

The experience of 1916 was repeated in 1917 and 1918 and, although there was a low Nile and poor rains in 1918, the country suffered no serious setback in 1919. Conditions in 1920 were influenced by the world depression in trade, nevertheless the year (following average rains and a medium flood in 1919) proved one of fair prosperity.

In considering the productivity and industry of the country it should be remembered that the Sudan consists of three natural zones, the desert zone in the north, where cultivation is only possible in a narrow strip on either bank of the Nile; a central zone where there are large areas of fertility, including the rainlands of Kassala and of Tokar, the Gezira plain, the pastures and gum-forests of Kordofan; and a southern belt, where the soil is richest and the rain tropical. But this southern belt up to 1921 yielded very little, for the negroid tribes which inhabit it showed scant inclination to do more than supply their own needs, while the lack of communications over enormous distances and the difficulties of administration rendered development by outside agencies extremely hazardous. Timber was, however, obtained from the forests of the Bahr el Ghazal and Lado and a (diminishing) quantity of ivory.

Apart from the tribes of this southern zone—and even among them progress in civilization was made—the people of the Sudan, negro and "Arab,"[1] showed willingness, in many cases eagerness, to benefit by Western civilization. Their standard of living became more exacting and their desire for education greater. Moreover, the possibilities and advantages of trade, through the World War, had been brought home to a larger number of the population than before. "There has been," wrote the governor-general, Sir Lee Stack, in April 1920, "an advance in energy and initiative, particularly among those who make their living by cultivation."

Products and Trade.—Gum arabic is perhaps the most characteristic product of the Sudan, which provides the bulk of the world's supply. Formerly the only Sudan product in which Germany had a direct interest, the largest share of the gum trade is now with Great Britain. In 1913 the export of gum was 336,000 kantars, it fell to 258,000 kantars in 1915 and was 344,000 kantars in 1919 (a kantar equals 99·049 pounds). The value of the gum varied in the period named from £E314,000 to £E744,000. The principal crops are durra (millet) and cotton. As the area cultivated depends upon an uncertain rainfall and an equally uncertain Nile flood, the amount produced is liable to great variations. In 1915 the total area under cultivation was 2,463,000 feddans, in 1916 it fell to 1,489,000 feddans, was over 2,000,000 in 1917 and but 1,669,000 in 1919 (a feddan equals 1·038 acre). Nor in respect to durra does the export correspond to the crop raised. Much of the grain is home-consumed and only the surplus sent abroad. The durra exported in 1913 was 2,080 tons; in 1914 only 530 tons. Exports rose to 84,000 tons in 1917 and fell to 1,650 tons in 1919. The total export of durra for the five years 1915–9 was 245,300 tons, against 53,500 tons in 1910–4.

Great expectations were held as to the development of the area under cotton by irrigation, but the financial situation created by the war rendered any large extension impossible for the time being. The variation in output was great—9,400 bales (of 400 lb.) in 1914; 23,900 bales in 1915; 12,300 bales in 1919. The total export of cotton in the 10 years 1910–9 was 161,000 bales. The yearly fluctuation was mainly due to the variation in the crop of flood-grown cotton in the Tokar district, Red Sea province. Only by irrigation works and by the building of railways to afford the cotton districts rapid and cheap means of access to the world's markets could any great increase of the crop be expected (see below: *Irrigation* and *Communications*).

Besides gum, cotton and durra the chief exports were cattle and sheep, hides and skins and sesame. The extent to which the export of live stock was stimulated during the war is shown by the following figures: Total number of cattle exported 1910–4, 64,400; in 1915–9, 129,500. In the same periods the number of sheep exported was 459,000 and 648,000 respectively. The export of hide and skins, however, decreased, being 1,928,000 in the five years 1910–4 and 1,552,000 in 1915–9. The very large number of camels exported for the use of the Egyptian Expeditionary Force is not included in the trade returns. Supplies of ivory decreased; 2,792 kantars were exported in 1913 and only 1,105 kantars in 1919. Dates, wood, charcoal, gold and senna were minor exports.

Three-fourths of the total exports go in the first place to Egypt, whence a considerable proportion is reëxported to Europe. Nearly all the rest of the exports go to Arabia, Abyssinia or Eritrea. Imports consist mainly of textiles and food-stuffs. An indication of the increased purchasing power of the people was the rise in the value of the imports of cotton fabrics, sugar, tea, coffee and spices. Those imports were valued at £E684,000 in 1914 and at £E2,062,000 in 1918. Imports come mainly from Great Britain and Egypt (each about 30%) and India and Aden (about 15%). South Africa (chiefly coal and sugar) and Abyssinia supply most of the other imports.

The following table shows the value of external trade (excluding specie) in the years named:—

Year	Imports	Exports (including Reëxports)	Total
1910	£E1,348,000	£E 977,000	£E2,325,000
1913	2,109,000	1,278,000	3,387,000
1918[2]	4,024,000	4,210,000	8,234,000
1919[2]	4,805,000	3,009,000	7,814,000

Irrigation.—The cultivator in the Sudan depended mainly on the rainfall and only to a less extent on the Nile flood and on artificial irrigation. While these conditions continued the area cultivated, in a year of good rains, could not much exceed 2,500,000 feddans, while cultivable land, given irrigation, has been estimated as high as a fourth of the total area of the Sudan. The Sudan Government elaborated schemes for irrigating a small portion of this uncultivated land, namely the Gezira plain and the Tokar area. In addition they embarked in 1909 on a scheme for irrigating an additional 100,000 feddans in the Dongola province by annual flooding on the basin system. In 1917, as an emergency measure to meet war needs, some 19,000 feddans in Berber and Dongola provinces were put under cultivation by means of pump irrigation.

The Gezira scheme was of much importance. The Gezira (=island) is the land lying between the White and Blue Niles. It was originally proposed to irrigate 100,000 feddans. Experiments undertaken in 1911 at Tayiba, near Wad Medani, on the Blue Nile, having proved conclusively that Egyptian cotton of the best quality could be grown commercially in that district, irrigation work was started early in 1914, with funds advanced by the British National Debt Commissioners. The intention then was to raise in London a loan of £3,000,000 to meet the expense of the work, but owing to the World War the scheme had to be held in abeyance. Eventually, in 1919, a loan of £6,000,000 was authorized by the British Parliament, £4,900,000 to be spent on the Gezira works. Meanwhile it had been decided to increase the area to be irrigated to 300,000 feddans. The Gezira scheme provided for the erection of a dam on the Blue Nile at Makwar, near Sennar, so as to raise the river to a level sufficient to feed a great canal excavated across the plain. Work on the canal, the levelling survey and the necessary buildings was continued at a snail's pace (owing to war exigencies) until 1917, when a fresh start was made. In the interval the Egyptian Government had intervened with irrigation projects intended for the benefit of Egypt, and in 1916 investigations were conducted in connexion with the water supply of both the Blue and White Niles. The result was a larger project, for which Sir Murdoch Macdonald, then adviser to the Egyptian Ministry of Public Works, was responsible. In addition to the Gezira scheme it was decided to build a dam across the White Nile at Gebel Aulia about 24 m. south of Khartum, which should be able to hold up nearly double the quantity of water stored by the Aswan dam—this White Nile dam being for the benefit of Egypt. Drawings of the two dams, both engineering works of the first magnitude, were completed in 1917. Cement having been found at a convenient spot near Makwar, a factory was erected there in 1919, and the preliminary work pushed forward on both dams, some of the workmen engaged being brought from the Yemen. Sir William Willcocks, the engineer of the Aswan dam, having very severely criticized the schemes, a Nile Projects Commission, composed of eminent engineers unconnected with the Egyptian or Sudan services, made a thorough investigation during 1920. The commission reported that both schemes were sound and the last obstacle to the building of the dams appeared to be overcome. In 1921, however, the Egyptian Government was compelled, owing to the serious financial situation, to order the discontinuance of work on the Gebel Aulia dam; the Gezira operations were continued but at a greatly reduced rate. Up to June 30 1921 some £E3,264,000 had been spent upon the Gezira schemes. Meanwhile a proposal to increase the Sudan loan to £9,500,000, owing to the increased cost of labour, material and transport, had been rejected. The Tokar area irrigation works, for which only £140,000 was estimated to be needed, were continued.

Communications.—As a corollary to the irrigation schemes at Tokar a railway from that town to the seaport of Suakin was sanctioned in 1919. The distance is about 60 miles. The railway south from Khartum to Sennar and thence, crossing the White Nile at Kosti, westward to El Obeid, the capital of Kordofan—a distance of 428 m.—was completed in 1911. It had the immediate effect of stimulating the trade in gum arabic for which Kordofan is famous. Both railways and steamers are State-owned; in 1918 the steamers department, which controlled the whole of the river traffic on the White and Blue Niles and their tributaries south of Khartum, was incorporated with the railways department, which had taken over the administration of the harbour of Port Sudan in 1914. The chief difficulty of the department during 1914–20 was in maintaining regular services efficiently. Great difficulty was experienced in keeping the Bahr el Ghazal free from sudd blocks, which caused much delay to steamers.

The upkeep of existing roads and the building of new roads entailed heavy labour and expense. In the northern and central zones wells had to be dug to make many of the tracks usable; in the south there was superabundance of water and dense forests to be cut through. One of the most important trade roads was that from Rejaf—the southern limit of navigability of the Nile from Khartum—westward to the Belgian Congo border. Good work was done on this road in 1916–8. Eighty streams had to be crossed in 125 m.; a single-span steel bridge 193 ft. long was erected over the river Yei. The difficulty of keeping the roads practicable in the equatorial regions in the long rainy season was great. It was largely on the opening-up of roads, and more roads, that the complete pacification of the southern provinces depended. From 1916 onward experiments were made in the use of motor tractors and cars on the roads, with at first but moderate success. In 1920 the use of aeroplanes by officials for visiting distant posts was first recorded. This followed the laying-out in 1919 of a number of aerodromes and the passage in Feb. 1920 of aeroplanes engaged in the first Cairo to Cape flight. This flight led to the discovery, from the air, by Dr. Chalmers Mitchell, of the volcanic character of a range of hills in the Bayuda desert (*see* AFRICA: *Exploration*).

---

[1] Most of the "Arab" tribes in the Sudan are of Hamitic stock.

[2] Includes for 1918 Government imports £E988,000, and for 1919 Government imports £E1,804,000.

On the conquest of Darfur the telegraph system was extended to its capital El Fasher. Telephone exchanges are established in the chief towns. The first wireless telegraphic stations were erected in 1915—at Port Sudan, Malakal, Nasser and Gambeila, a chain extending from the Red Sea to S.W. Abyssinia. In 1916–8 five other wireless stations were erected, three in Darfur, the others in the far south, at Wau and Mongalla.

Finance.—The subvention in aid of civil expenditure made to the Sudan by the Egyptian Government, which began in 1899 with an allocation of £E.156,000, reached its maximum in 1902 with £E.268,000, after which it was gradually reduced. In 1912 it stood at £E.163,000. In 1913 it ceased to be paid in accordance with an arrangement by which the Egyptian Government credited the Sudan with the amount of the customs collected in Egypt on goods entering and issuing from the Sudan, estimated at £E.85,000. The Egyptian Government, however, continued to defray military expenditure on account of the Sudan, estimated at £E.172,000. The insufficient rains and low floods with other external factors exercised an adverse effect on the economic situation just when the subvention was withdrawn. Nevertheless, the Sudan budgets of 1913–4–5 closed with a slight surplus. The more prosperous conditions which followed eased the situation and allowed an increase of taxation without impairing trade. Revenue, which in 1911 stood at £E.1,664,000, rose in 1919 to £E.2,950,000, with a surplus over expenditure of £E.267,000. The budget for 1920 was balanced at £E.3,500,000. A traders' tax was imposed in 1913, the trading community as a class having up to then paid nothing in direct taxation. In 1919 £E.6% was payable on assessed annual profits exceeding £E.500. In 1917 an excise duty was imposed on sugar, in 1919 the duty on tobacco was raised; heavy increases were made in railway and steamer rates both for goods and passengers. The railway and steamer services yielded a substantial profit (£E.210,000 in 1915, £E.286,000 in 1919). The rise in the price of all commodities was the main cause of the increase in taxation. The surpluses obtained since 1916 were passed to a reserve fund, the only source available, apart from borrowing, for capital expenditure. On Jan. 1 1920 the reserve fund amounted to £E.426,000 only, the "reserve" being almost wholly expended year by year on necessary works.

Education.—The Government schools are all in the northern or Moslem half of the Sudan; the only schools among the pagans in the southern half are those of the missionary societies. In the north there was a considerable increase in the number of boys attending elementary vernacular schools, while the sending of girls to school became more popular with parents. There were in 1919 five elementary girls' schools, besides higher schools for girls managed by missionaries. There was after the war a considerable demand for boys with a technical or industrial education. In 1920 over 400 boys trained in the Gordon College workshops were in employment, as to three-fourths in Government service. (F. R. C.)

Political History.—The political status of the Anglo-Egyptian Sudan remained in 1921 as defined by the treaty between Great Britain and Egypt of Jan. 18 1899. Although the country passed through a period of depression in 1913–5, comparing 1920 with 1910 there was a distinct advance in the well-being and resources of the people. The recovery from the disastrous rule of the Mahdi and Khalifa was shown by the large increase in population. The period 1910–20 was also notable for a marked growth of confidence in the Government. The loyalty of the leading chiefs and notables was never in doubt, and throughout the World War the vast majority of the people remained peaceful and contented. The number of minor operations undertaken both before and after the war were mainly against primitive tribes in the far south and did not affect the more highly developed provinces.

By the annexation of Darfur in 1916 (see below) the area under the control of the Sudan Government was increased to over 1,000,000 sq. miles. This vast region was administered in 1921 by some 110 British officers and officials, assisted by a technical staff. The military establishment included 14,000 men of the Egyptian army, with one British infantry battalion and a detachment of garrison artillery at Khartum. A new unit, the Western Arab Corps, was raised for service in Darfur.

The Lado Enclave (*see* 16.60) was transferred in 1910 from the Belgian Congo to the Sudan and added to the province of Mongalla. In the same year an outbreak of the old fanatical spirit had to be suppressed in Sennar, and during 1910–2 minor expeditions dealt with local disturbances in Kordofan and Mongalla. Others were also undertaken in 1914–8 to deal with turbulent elements in the Nuba Mountains—traditionally obnoxious to authority—and to keep order in the equatorial regions, where the Nuer and Dinka tribes gave a good deal of trouble. The most important of these operations was in the Nuba province in 1917–8. After a number of collisions, in which Capt. R. W. Hutton was killed (April 1917), a considerable force was sent in the autumn of that year and after a somewhat arduous campaign the hill tribes were in Feb. 1918 reduced to submission. In 1918 the Sudanese troops aided in operations against the warlike Turkana, a tribe, much given to raiding, living on the Sudan-Uganda border. Unfortunately neither the Sudan nor the Uganda Government had forces to spare to station troops permanently in this remote area.

An incident at Kassala towards the end of 1918 of no political importance is yet noteworthy as illustrative of the sporadic outbursts of fanaticism to which parts of the Sudan were liable. It was thus officially recorded:—

> "Without a word of warning and in the dead of night a band of some 40 fanatics, led by a religious lunatic, suddenly rushed the guard and inlying picket furnished by the Egyptian unit on the fort and then proceeded to attack the lines of the camel company of the Eastern Arab Corps. No longer aided by the element of surprise, the band suffered heavily in killed and wounded at the hands of the latter unit. The leader was amongst the killed and the few that escaped were ultimately accounted for by the camel company and the police."

Aggressive action by the Aliab section of the Dinkas in Mongalla province led to the despatch of a small force in 1919 under Maj. R. F. White, which was accompanied by the governor, Maj. C. H. Stigand. An attack by spearmen in the long grass led to the death (Dec. 8 1919) of these two valuable officers and other casualties, entailing a punitive expedition in the following year.

The completion of the railway from Khartum to El Obeid, the capital of Kordofan, in 1911 enabled the Government better to control Darfur, where 'Ali Dinar ruled as a Sultan tributary to the Sudan; and, after the French occupation of Wadai, negotiations were in 1912 opened with France for the determination of boundaries by the inspector-general, Sir Rudolf von Slatin, on behalf of Great Britain and Egypt.

In Jan. 1912 King George and Queen Mary paid a visit to Port Sudan on their return journey from India, and a review was held at Sinkat by the King, at which representatives from almost every section of the Sudan were present. The scanty rainfall and abnormally low Nile of 1913 caused famine conditions in portions of Dongola and the Blue and White Nile provinces. Relief measures and the importation of large quantities of millet from India made a most beneficial impression on the populations affected. In April 1914 an exchange of certain districts on the Upper Nile was effected, in the interests of both administrations, with the Uganda Protectorate (*see* UGANDA).

On the outbreak of war with Turkey in Nov. 1914 the various provinces of the Sudan, notwithstanding the Moslem character of the majority, displayed perfect loyalty to the administration. In Darfur, on the other hand, the Sultan 'Ali Dinar renounced his allegiance, and, instigated by Turkish emissaries working through the Senussi sect, contemplated an invasion of the Sudan. His communications with the Senussites were cut off by posts of irregulars, and early in 1916, military operations were undertaken which led to the defeat and subsequent death of 'Ali Dinar (for the military operations, *see* SENUSSI). Darfur was thereafter administered as a province, and an Anglo-French convention, signed at Paris on Sept. 8 1919, at length settled the common frontier of Darfur and Wadai. The occupation of Darfur was followed by an expedition in coöperation with the French in the region north of Darfur against marauders of the Guraan tribe, who had given considerable trouble to both administrations. A garrison for Northern Uganda, whence troops had been withdrawn to meet the menace from German East Africa, was for a brief period provided by the Sudan Government. Except in Darfur, the war did not, externally, touch the Sudan at any point, and its administration continued on normal lines. The Prince of Wales visited the Sudan in 1916 and the Duke of Connaught in the following year.

The disturbances which broke out in Egypt in 1919 interrupted direct communications with Cairo, and the temporary cessation of Nile traffic caused a certain loss of trade. The Sudanese populations were not concerned with the aspirations of Egyptian nationalism, and the large Egyptian official community, while by no means indifferent to the development of events in their own country, did not actively display sympathy, so that this period of crisis passed without incident. Nor did the Armistice and the negotiations which followed the victory of the Allies occasion special comments. A delegation of Sudanese notables proceeded to England to offer congratulations on the successful termination of the war and returned with pleasant impressions of their visit. The only remaining centre of unrest in 1921 was the Abyssinian border, where raids and hunting parties of chiefs, nominally but not effectively under Abyssinian control, continued to give difficulty.

The outstanding event in Sudanese history during the war period was the withdrawal of Sir Reginald Wingate from the governor-generalship, on his being called to Cairo in Dec. 1916 as high commissioner for Egypt. He succeeded Lord Kitchener as Sirdar of the Egyptian army and governor-general in Dec. 1899, after an almost continuous service with the Egyptian army since 1883. Under his able and sympathetic administration the Sudan had emerged from the chaotic condition to which Mahdist misrule had reduced it, and gradually developed into a peaceful and contented country. His name will long be remembered by the people to whose regeneration he devoted the best years of his life. Another historic association with the Sudan was terminated by the outbreak of war between Great Britain and Austria-Hungary, when Sir Rudolf von Slatin, the inspector-general, whose advice in all native affairs had been most valuable, was inevitably compelled to resign. Mention may also be made of the resignation of Sir Edgar Bonham-Carter in 1917 after 18 years' service. He had been responsible for the creation and development of the whole legal and judicial system of the Sudan.

Col. (afterwards Maj.-Gen. Sir) Lee Stack, civil secretary to the Sudan Government, succeeded Sir Reginald Wingate as governor-general and sirdar; Slatin Pasha's post was not filled.

See the Annual Reports on the finances, administration, etc., of the Sudan, issued annually in London up to 1913, and the Report for 1914–9, issued 1920, which is of special value. The *Sudan Almanac* and *Handbook to the Sudan* are also official publications. Murray's *Guide to Egypt and the Sudan*, and Macmillan's, Baedeker's and Lock's guide-books may be used with profit. See also Y. P. Artin, *England in the Soudan* (1911); and *Sudan Notes and Records*, an excellent serial publication begun in 1918. The Survey Department, Khartum, issues a map of the Sudan, in many sheets, on the scale of 1:250,000. (J. R. R.)

SUDERMANN, HERMANN (1857–), German dramatist and novelist (*see* 26.20). His novels include *Das hohe Lied* (1909); and *Litauische Geschichten* (1917); while in 1911 appeared a volume of short stories, *Die indische Lilie*. His later plays include *Strandkinder* (1910); *Der Bettler von Syrakus* (1911); *Der gute Ruf* (1913); *Die Lobgesänge des Claudian* (1914), and *Das Höhere Leben* (1919).

SUESS, EDUARD (1831–1914), Austrian geologist (*see* 26.21), died at Vienna, April 25 1914.

SUEZ CANAL (*see* 26.22).—The five years 1909–13 witnessed a considerable increase in the traffic passing through the canal. The World War greatly restricted the use, particularly in 1917.

In the following table the figure for receipts is obtained by taking 25 francs as equal to £1 sterling except for 1920, when the rate is reckoned at 50 francs to the £1:—

	No. of vessels	No. of passengers	Net tonnage	Gross receipts
1909	4,239	213,122	15,407,527	£4,782,724
1913	5,085	282,235	20,033,834	£5,140,403
1917	2,353	142,313	8,368,918	£2,880,761
1920	4,009	500,147[1]	17,574,657	£5,329,213

[1] This abnormal increase was due to the movement of troops.

In Feb. 1915 the Turks, who had traversed the Sinai peninsula, attacked the Suez Canal at various points, and it was not until after the battle of Romani in Aug. 1916 that all danger to the canal was ended. Throughout this period traffic was interrupted on two occasions only, and then for very brief periods. During the World War, under Adml. Robinson as Director-General of the Egyptian Ports and Lights Administration, 1,239 transports and men-of-war, totalling over 8,000,000 tons, were passed in safety through the canal, and 965 transports, 43 hospital ships, 36 store ships and 307 colliers were dealt with at Port Said.

Striking differences in the pre-war and post-war shipping were the elimination temporarily after 1914 of German vessels (which in 1911 had 13·4% of the tonnage) and the increasing number of Japanese and United States ships using the canal. Japanese vessels represented before the war 1·7% of the tonnage; in 1920 their tonnage had increased to 9·1%. United States vessels, rarely seen in the canal before the war, in 1920 represented 4·1% of the tonnage. British ships continued to provide the bulk of the tonnage, the proportion in 1920 being 61·7% compared with 62·2% in 1911. In 1920 three passages were made by steamers of over 23,000 tons gross, a figure never before reached, and one vessel had a length of 669 ft., the longest registered in the canal. The quantity of goods passing through the canal in 1920 was 34% below the figures of 1913. There had been some change in the character of the merchandise, foodstuffs diminishing sensibly in volume, though corn from Manchuria and China made its appearance. Imports of coal from S. Africa and Australia were particularly marked in 1919 and 1920.

A scheme to extend the concession of the Suez Canal Co.—the existing concession does not expire until 1968—was rejected by the Egyptian General Assembly in 1910, not on its merits but in an effort to discredit the British administration. The Suez Canal Co. coöperated heartily with the British authorities in Egypt during the war. To meet the increased costs caused by the war the Company in 1916 and 1917 imposed higher tariff charges, which, after the war, acted in restraint of traffic and were not of permanent benefit to the Company. In 1919 the Company asked to have put into operation at Port Said the free zone regime provided for in an agreement made in 1902 between it and the Egyptian Government. It held that the transit trade would be stimulated if an area were set apart in which goods could be handled, or remain, uncontrolled by the customs. An agreement on the subject was drawn up in 1920.

It is noteworthy that in 1919, and to a much more marked extent in 1920, the Company benefited by the decreased value of the franc. This was made possible as shipping dues were collected in Egypt and were paid in money less depreciated than the franc, and profits earned in Egypt were used in the purchase of francs at current rates. In 1920 the benefit from these operations amounted to 101,772,000 francs, or over £2,000,000 at average rates of exchange.

The annual reports of the Suez Canal Co., published in Paris, give full statistical information. (F. R. C.)

SUGAR (*see* 26.32).—In the year 1910–1 the world's production of sugar amounted to 16,951,000 tons, of which 8,391,000 tons were produced from cane and 8,560,000 tons from beet, including that grown in America. For 1913–4 the world's total production reached 18,486,000 tons, of which the cane production was 9,577,000 tons—an increase of 1,186,000 tons of cane. The beet crop for the same period was 8,909,000 tons, of which 655,000 tons were grown in America—an increase of 349,000 tons. These were the highest figures reached during the decade 1910–20, for after the outbreak of the World War in 1914 the European production declined yearly, until in 1919–20 the world's beet crop reached only a little over 3,200,000 tons, of which 653,000 tons were American. The world's crop of sugar for 1920–1 was estimated at about 16,475,000 tons, of which cane was estimated to produce over 11,828,000 tons, and beet 4,647,000 tons, of which 935,000 tons were American.

Owing to the British Government recognizing at once the importance of securing to the nation a supply of sugar sufficient for the wants of the people, sugar was the first commodity to be controlled in the United Kingdom during the war (*see* Food Supply), and within a few days of its outbreak the Government had bought several thousand tons of sugar. In Aug. 1914 a Royal Commission on the Sugar Supply was formed. It took over the duties of buying and selling sugar. These operations were done through the ordinary channels of trade, and everyone was guaranteed a supply on the basis of his trade before the war, the actual quantities being fixed from time to time in proportion to the sugar held by the Government; and it is not too much to say that the sugar control was the most successful of the many Government controls.

It may be noted that in the Final Report of the Commission issued in June 1921 it was stated that: "The wisdom of the Government in at once taking over in 1914 responsibility for the sugar supply was, in our opinion, fully proved in the sequel. But while we recognize that in the special circumstances State management was a necessity, our experience does not lead us to think that State control is a desirable thing in itself in the region of trade in commodities."

The total consumption of sugar sold under control was approximately as follows:—

	Tons
1915	1,818,488
1916	1,314,910
1917	1,219,761
1918	1,109,905
1919	1,595,004
1920	952,408

The stocks held by the Commission on March 31 1921 were 390,479 tons of raw and 57,787 tons of white.

The Commission had desired to carry out their operations free of cost to the Exchequer. "This aspiration cannot now be realized," they add, "but the fault is not ours. From time to time since the middle of 1919 the Commission has on various occasions pleaded for an increase in the selling prices of its sugars, so as to build up a reserve to meet the loss which it foresaw as probable on the liquidation of its stocks on the conclusion of its operations. But on no occasion has a rise been authorized until weeks or months after it was recommended, and then not always to the extent recommended.

"From a calculation we have made we are able to say that if our recommendations (which were always kept as low as possible in view of the reluctance shown by the Cabinet to an increase in prices) had been approved at the time they were made our receipts would have been £16,000,000 more than they have been in fact. Even that sum is less than the deficit which it is probable that the Exchequer will have to meet on our operations, and which we estimate at not less than £24,500,000. Some may perhaps hold that it is not of material importance to the public whether it has to bear a burden of this kind in its capacity as a taxpayer or in that of a consumer of sugar. But to us it is a matter of regret that we shall not be able to claim that we discharged the duties imposed upon us without having recourse to the funds of the Exchequer otherwise than for the purpose of the temporary financing of our operations. The advances made to us under this latter head by the Treasury stood on March 31 at £27,281,937."

The cost of the establishment of the Commission from 1914 to 1922 is given as £103,239.

The year 1920 stands out as having the most violent fluctuations the sugar trade has probably ever experienced. The British Royal Commission on the Sugar Supply and the American Equalization Board acted conjointly in 1919, and by their actions controlled both the American and European markets. Prices were kept between 30s. and 63s. per cwt. for Java 96° F.L., but there was some hesitation in the autumn with regard to the continuation of the operations of the American Equalization Board, which did not decide on further action until December. In the meantime a good deal of the Cuban crop had been sold to Europe and the East on a basis of 6½c. per lb., and when the American Equalization Board decided to continue control it was too late to secure the Cuban crop. The planters, having sold a certain quantity of sugar, were independent, and prices were forced up to 12c. (equal to 76s. 9d. per cwt.) at the end of January. In Feb. there were, however, large offerings on the part of the Cuban planters, owing to supplies of sugar coming into the market, and quotations declined to 9c. (equal to 59s. 3d. per cwt.). In March the American refiners began to buy freely, and this increased demand was intensified by two serious reductions in the estimate of the Cuban crop. Wild speculations took place, and in May as much as 23½c. (equal to 136s. per cwt.) was paid. Large purchases were also made in Jan. and May of Manila sugar for shipment during the summer months. The effect of these inflated prices brought its own remedy; consumption decreased rapidly both in England and in America, and by the end of July Cuban prices had fallen to 16c. which was equal to a fall of 40s. per cwt. This fall continued until, at the end of the year, Cuban sugar was actually sold at 3⅝c. per lb., or equal to a total fall from the highest point of over 110s. per cwt. The result of these heavy fluctuations caused a financial crisis in the trade. Enormous losses were suffered by the American and Canadian refiners, who had bought and sold heavily for the autumn months, and these forward sale contracts were largely repudiated when the time came for delivery. The British refiners, being still under control, escaped these violent losses.

The values of refined sugar in 1910 varied from 17s. 3d. to 23s. 6d. per cwt. for Tate's cubes, and in 1911—the year of exceptional drought—prices continued to advance to 27s. 6d., but towards the end of 1912 prices declined to 19s. 3d. and with slight fluctuations prices were further reduced at the outbreak of war to 17s. 9d. There was then a steady rise, and in 1914 cubes were sold at 35s., and granulated at 30s. per cwt.; in 1915 cubes were 50s. and granulated 33s., and then by gradual stages till, for domestic consumption, cubes in 1920 reached 116s. and granulated 112s., but, under the voucher system which was in vogue during control, the prices of sugar for manufacturing purposes were from 160s. to 164s. per cwt. Refined sugar produced by the British refineries from 1910 till the outbreak of war averaged about 45% of the total consumption, but after the war the production was about 74%. The British duty from 1910 till 1914 was 1s. 10d. per cwt., in 1915 9s. 4d. per cwt., in 1916 14s. per cwt., and in 1918 it was increased to 25s. 8d. per cwt., at which it remained in 1921. This was out of all proportion to the value of the sugar, and naturally checked consumption.

In 1913 the British Government withdrew from the Brussels Convention, which had been adopted in 1903, after many years' endeavour on the part of Great Britain to counteract the effect of the system of continental bounties on beet sugar. The adoption of the Convention had undoubtedly saved the British West Indian sugar trade from extinction, and British sugar refiners were able to compete on more equal terms. At the same time there was still strong opposition in England from the Free Trade party, who were anxious to have sugar at any price, whatever injustice might be inflicted on the British colonies and the home refiners. In 1911 there was a serious falling-off in the European beet crop, and there was a large deficiency in the world's supply, so that an inevitable rise in price took place. Russia, however, had large stocks on hand, which, under the Convention, could not be imported into England owing to the fact that prohibition was in force instead of countervailing duties. Had there been countervailing duties the sugar would have been shipped to England and the difference in duty paid. Giving way to pressure from those who were anxious to get cheap sugar irrespective of the reason for the cheapness, Mr. Asquith's Liberal Government gave notice in Aug. 1912 to withdraw from the Convention. The curious feature was that, as the result of this notice, Russia was permitted to send a considerable quantity in excess of the limit laid down by the Convention, but the quantity she sent had very little effect in making up the shortage of about 1,700,000 tons of the world's production.

In 1919 Mr. Lloyd George's Government (with Mr. Chamberlain as Chancellor of the Exchequer) took a further step in accordance with the views of the British West Indian planters, and agreed to give preferential treatment to sugar produced within the British Empire, in the form of a reduction in its case of one-sixth off the import duty on sugar. The British preferential duty on raw sugar at 96° polarization is equal to a preference of about 3s. 9d. per cwt., and on white sugar of a polarization over 98° 4s. 3.33d. It was too soon in 1921 to know what permanent effect this concession would have upon the production of sugar in the British colonies, but it was hoped that it would enable their planters to compete with Cuba and other countries where costs are considerably less, and consequently secure a larger share of the sugar trade of the United Kingdom.

Since 1910 serious attempts have been made to grow beetroots in England for the manufacture of sugar. A factory was erected in 1911 in Cantley, in Norfolk, but was worked only one season, and was closed during the war. It was purchased by a private Liverpool firm in 1920. A fair quantity of beetroots was grown in the immediate neighbourhood, but the high price which was given for the roots made it impossible for the purchaser to make a profit on the sugar produced. As a matter of fact a loss of from £60,000 to £70,000 was incurred. A further and more ambitious attempt was in 1921 being made at Kelham, Notts, where a large factory was erected, considerable quantities of beets having been planted in the neighbourhood. The British Government not only subscribed £250,000 of the capital, but also guaranteed interest on the amount of public capital raised at 5% for 10 years, and took £125,000 of second debentures.

SUKHOMLINOV, VLADIMIR (1848-), Russian general and war minister, was born in 1848. He passed through the cavalry school in St. Petersburg, and in 1867 was given a commission in the Guard Ulans. He graduated from the Academy of the General Staff in 1874. He took part in the war with Turkey in 1877–8 as an officer of the general staff, and was awarded the St. George Cross of the fourth degree. From 1884 to 1886 he commanded a dragoon regiment and from 1886 to 1897 he was the head of the officers' cavalry school in St. Petersburg, having meantime in 1890 been promoted to the rank of general. His next appointment was as commander of the 10th Cavalry Division. In 1899, while commanding the troops of the Kiev military district, Gen. Dragomirov appointed him as his chief-of-staff and later as his assistant. His close connexion with Gen. Dragomirov, who enjoyed enormous prestige in the Russian army, ensured Sukhomlinov's future career. After the death of Dragomirov, he was appointed commander in Kiev.

From 1909 to 1916 he was Russian war minister, and it was under him that two Russian orders for mobilization were given at the outbreak of the World War. Self-confident and ambitious Sukhomlinov played a disastrous rôle in the administration of the Russian army. Notwithstanding the discovery, even in Oct. 1914, that there was an insufficiency of shells, rifles and cartridges, he assured the Duma that everything was all right. It was only in 1916, under strong pressure of public opinion, that the Tsar Nicholas II. dismissed him from office. Finally he was brought up for trial on a charge of treason. The court found him guilty of offences in office, and he was sentenced to penal servitude. Later Sukhomlinov was freed by an amnesty granted by the Bolsheviks and went to Finland. In 1921 he began the publication of his memoirs. (N. N. G.)

SUN YAT-SEN (1867–), Chinese leader of the revolutionary movement which ended in the abdication of the Manchu dynasty in Feb. 1912, was born in Kuangtung province, the son of a native Christian. He studied at the College of Medicine in Hong-Kong from 1887 to 1892, and there took his degree in medicine and surgery. He practised his profession first at Macao and then at Canton, but from the outset of his career displayed more interest in politics than in medicine, being by temperament an iconoclast, an organizer of secret societies and a leader of conspiracies against the established order of things. Inspired by his semi-European training, with bitter resentment against the Manchus, whom he regarded as responsible for China's humiliation at the hands of Japan, he first raised the standard of rebellion and of Cantonese independence in 1895; but the *coup* failed and Dr. Sun was compelled to seek safety in exile. Henceforward all his energies were directed towards stimulating the anti-dynastic movement, first by the collection of funds from the Chinese communities in the United States, Hawaii and the Straits Settlements, and then by organized propaganda work conducted by secret agents throughout the Empire. He received considerable assistance and encouragement in Japan, where he founded a society known as the Tung Men-hui, which played a prominent part in Chinese politics after the establishment of the Republic. Although an exile, he was generally regarded by the "Western-learning" section of Young China as its leader, especially after the Chinese Government's attempt to kidnap him in London, in 1896. In 1911, when the revolution broke out prematurely at Wuchang, Dr. Sun was in England; but he hurried back to China and arrived at Shanghai on Christmas Eve, in time to be acclaimed as the originator of the Republican programme and elected Provisional President by the delegates to the National Convention assembled at Nanking. On Jan. 5, after having taken the oath of office, he issued a Manifesto (countersigned by Wu Ting-fang as Minister for Foreign Affairs) in which the purposes and policy of the Republican Government were proclaimed. On Feb. 12 an Imperial edict announced the abdication of the Emperor; it surrendered the reins of government to the representatives of the sovereign people and declared that henceforth the constitution should be Republican; at the same time, the organization of the new form of government was entrusted, "with full powers," to Yuan Shih-k'ai. On the 14th, Sun Yat-sen resigned the Presidency and in the name of the Nanking Assembly invited Yuan to accept the position of Provisional President. His action was applauded by Young China at the time as evidence of patriotic self-abnegation, but events proved that it was chiefly inspired by recognition of the fact that he and the Cantonese group of politicians who had joined him as leaders of the Republican movement, did not yet carry sufficient weight to justify them in attempting to form a national government.

Relations between Sun Yat-sen and Yuan Shih-k'ai were never cordial, but until the ejection from Peking of the Kuo Min-tang Radicals by the President Dictator in 1913, they preserved the appearance of goodwill, and towards the end of 1912 Sun accepted a highly paid appointment as Director of National Railways at Shanghai. After the failure of the Kuo Min-tang's "war to punish Yuan," Sun wandered again in a wilderness of conspiracies. Eventually, after the death of the Dictator (1916) he became one of the Cantonese group of politicians which waged continual warfare against the party in power at Peking. Because of the futility and sordid intrigues which characterized the independent Military Government at Canton, he, whose reputation in 1912 had stood high at home and abroad, came gradually to be regarded as an irreconcilable conspirator, whose personal ambitions were largely responsible for the continuance of the senseless civil strife between the North and the South. By the vehemence of his rhetoric, by the fervour of his grandiose schemes for the remaking of China at the time of the revolution, he captured the imagination of considerable sections of the public, especially in the United States; but his subsequent career failed to justify his own belief in himself as a heaven-sent reformer. In April 1921, a special session of the Southern (Canton) Parliament elected him to be President of the Chinese Republic, his supporters declaring the Canton "Military Government" to be the only lawfully constituted government in the country; but the influence of these Cantonese "Constitutionalists" over the other southern provinces had then become almost insignificant, and the "Military Government," prohibited by the Foreign Powers from interfering with the revenues of the Maritime Customs, was confronted by financial problems of a kind which threatened not only its reforming activities but its continued existence.

SUPAN, ALEXANDER GEORG (1847–1920), Austrian geographer, was born at Innichen, South Tirol, March 3 1847. He was educated at the Laibach gymnasium, and in 1870 took his doctor's degree at Graz, afterwards becoming a teacher in the Oberrealschule at Laibach. In 1872 he left Laibach and studied geography at Vienna, Dresden and Halle, returning in 1877. In 1881 he was appointed professor of geography at the university of Czernowitz, and in 1884 became editor of *Petermanns Mitteilungen*, retaining this post until 1909, when he accepted the chair of geography at Breslau. Under Supan's editorship *Petermanns Mitteilungen* was more concerned with reports and accounts of geographical work in every sphere than with original papers and records of discovery, and a feature in which the editor was much interested was the publication of supplements to the *Mitteilungen*. An account of the economic produce of N. America, 1880–5, appeared in this manner in 1886, and *Die Bevölkerung der Erde*, founded 1872 by Hermann Wagner and Behm, was continued by Supan as a supplement from 1890 to 1910. In 1889 he became editor of the statistical calendar of the *Almanach de Gotha*. His original contributions to geographical science are chiefly concerned with climatology and oceanography, and his published works include *Lehrbuch der Geographie* (1873); *Statistik der unteren Luftströmungen* (1881); *Grundzüge der physischen Erdkunde* (1884); *Deutsche Schulgeographie* (1895; latest ed. 1915) and *Die territorialische Entwicklung der europäischen Kolonien* (1906), besides many papers in *Petermanns Mitteilungen*. He died at Breslau July 6 1920.

SUPPLY AND TRANSPORT, MILITARY (*see* 26.113).—During the World War, the administrative services—*i.e.* the management of transport, supply, welfare and salvage—became of vastly increasing importance. The struggle was between groups of nations bending to the task of war the whole of the resources of a highly complex scientific civilization, and using in its prosecution every material and moral factor at their command. Some note of the working of the administrative machinery (especially at the culminating point of the struggle) is necessary to give a true picture of the war. Attention will be given here in the main to the British organization in 1918—with illustrative references to other armies and to prior dates. For the feeding of the British army, *see* FOOD SUPPLY.

When the armies first took the field in 1914, Germany was at a clear advantage in administration. That was to have been expected. It was her war, and she had prepared for it with meticulous care. The equipment of the German soldiers comprised several novel ideas for greater comfort and efficiency. Examining some of the German dead who had fallen in the early reconnaissance affairs in front of Tirlemont on Aug. 14, the writer had the first uneasiness that Germany might win, so strong was the evidence their equipment gave of a patient and thoughtful preparation. The impressive sweep of the German host through Belgium showed, too, that the German railway organization was superb, and the way the guns kept up proved that there had been a clear thinking out in advance of the new problems of ammunition-supply which the free use of heavy artillery as field pieces had brought to the fore. German staff documents published since the war by Gen. Ludendorff indicate that these matters of administration had been studied from 1910 onwards and that the German staff were confident that their inferiority in numbers would be compensated by a superior organization in supply. The French administrative services in 1914 appeared much weaker if examination were confined to plans and *matériel*. The troops were not as well provided for, the transport organization not so well planned. But if the human factor were taken into consideration much of the handicap was made up. The French showed a genius for improvisation on the actual battle field, and an astonishing faculty for "getting there" with inferior means. Their food scales for man and beast (to give an example) spelt scarcity in German or in English eyes; but they sufficed. In the battle the French soldier was never inferior in energy and endurance; and the French transport was generally up to time. The national *élan* overcame material deficiencies; and a genius for quick improvisation showed constantly, never more dramatically than in the mobilization of Gen. Galliéni's "Taxi-cab Army" which moved out to the defence of the capital at a critical juncture. The British administrative services in 1914 were lavish both of supplies and transport. But the British force was a small one, and though its scale of transport was extravagant compared with the French, the total was only 250 motor cars, 950 motor lorries and 40,000 horses. With railway transport it then had no concern: the French managed its railway transport. Indeed the British force in France in 1914 did not completely "administer" its own affairs. Though it was a distinct army in command it was dependent on the French organization for essential services of transport.

The Trench War.—A long period of trench warfare followed the battle of the Marne, and the administrative systems of the three armies were adapted to new conditions, the chief of which were an enormous increase of ammunition expenditure, the introduction of poison-gas as a weapon, calling for entirely new supplies of offensive and defensive material, and a simplification of the problems of transport, which in a stabilized warfare could follow almost a civilian routine, disturbed only by the chances of shell fire. The trench war was, of course, punctuated by heavy attacks on both sides, but the shift of ground was never great. Administration, whilst it had to cope with the enormous progressive increase in the scale and variety of supplies per division, was thus given ample time as a rule to increase its transport facilities. It could add to its broad-gauge railway tracks, supplement them by light railways and tramways as well as by motor-roads, and develop the canal systems as useful adjuncts.

In this period of trench warfare the Germans suffered from a steady deterioration as compared with the French and the British. The war had become a contest of *matériel* in which Germany could not keep up. The French were able to develop their supply on more generous lines with the help of British and American resources. The British transformed their system completely. The nation took the view that "money was no object" in securing for the troops the best possible chance of victory and the best possible comfort in the trenches. The growth of supplies (and therefore in transport) was almost incredible. The British force in 1914–5 suffered from a shell and gun shortage as compared with its enemy, because it had been trained and equipped for a different type of warfare. It had very little H.E. shell, and what it had was not really "high explosive" owing to poor fuzes. The patient search for a "fool-proof" fuze had been so successful that what little H.E. shell they had spluttered off rather than shattered off. The production of high explosive in 1914 was almost negligible. The whole year's supply would not keep the guns of 1918 going for a day. In 1915 Britain began to produce high explosive on a large scale. In 1916 she had increased the 1915 amount sevenfold. In 1917 she had increased that 1916 amount fourfold. From March 1915 to March 1917 the increase was twenty-eight fold. With the increase in the production of high explosive went a corresponding increase in big guns and in field pieces. The expenditure of ammunition in time reached to huge figures. The following are the biggest day records in tons:—July 1 1916 (Somme) 12,776; April 9 1917 (Vimy) 24,706; June 3 1917 (Arras) 17,162; June 7 1917 (Messines) 20,638; July 31 1917 (Ypres) 22,193; Sept. 20 and 21 1917 (Polygon Wood) 42,156; Aug. 8 and 9 1918 (general attack) 15,598 and 23,706. Ordinarily the British depots in France kept a reserve of 258,000 tons of ammunition, and the issues in a normal month ran to about that figure, though it varied a good deal month by month. Thus the average daily expenditure during the last months of 1918 was:—May, 5,478 tons; June, 4,748 tons; July, 5,683 tons; Aug., 9,046 tons; Sept., 8,576 tons; Oct., 4,748 tons; Nov., 3,158 tons. (*See also* MUNITIONS.)

Gas Warfare.—The introduction of poison-gas was, after the growth of ammunition expenditure, the chief factor in the increase of supply. It was constantly presenting new problems for the administrative services. At first British and French work was solely defensive—the provision of masks, the wearing of which would give immunity, the detection of new gases so as to provide new means of defence. But in time the Allies took the gas offensive, and then their gases were more potent and more plentiful than the enemy's, and for lack of material he could not give his men perfect gas protectors. The last form of gas warfare was the introduction of mustard-gas, a powerful corrosive discharged from shells, which infected the ground on which it fell for many hours. The use of mustard-gas by the enemy raised many problems of supply. The disinfection of contaminated ground with chloride of lime, a prompt change of clothing and bath treatment for men affected, proved efficacious in dealing with mustard-gas. There was, too, safety in protective overalls of oilskin. Mustard-gas affected the veterinary service heavily, there being many casualties to horses and mules through passing over ground infected with the gas.

Big-gun ammunition and gas-warfare munitions were, however, only two items of supply. Rifle and machine-gun ammunition, food for man and beast, trench stores, engineering stores, were other items, all of which had a tendency to grow. In the total during a spell of intense fighting, the British administrative services would carry up to the battle-line 1,934 tons of supplies of all kinds per day per mile of front. The intense battle-front might stretch over 10 miles or more, calling for some 20,000 tons of munitions, food and equipment per day for that 10 miles, much of it passing through furious shell fire before reaching its objective.

The French administrative services never reached the same scale of supply as the British. They expended less ammunition, issued a ration of less weight to man and beast, and dispensed with much of the "comforts" equipment of the British force. But in facing such a German effort as the Verdun attacks of 1916 they had a tremendous problem of transport, which was met by a motor lorry mobilization, the success of which was one of the great feats of the war.

British System Reorganized.—From 1914 up to the date of the first battle of the Somme (July 1916) the British administrative services had had no very severe test (unless the battle of Loos could be so counted, and the organization then was not good).

But by the middle of 1916 the British force in France considered itself completely organized. In munitions it was better supplied than any other force in the field. It had taken over control of its own railway services, supplementing the French broad-gauge railway system, which it had taken over and increased, it had a system of light railways and a greatly increased scale of motor transport. But the Somme battle showed many serious weaknesses. Supply had been increased beyond the scale that transport could cope with. There followed in Nov. 1916 a reorganization of the system. One feature of this organization was good. The division of authority, which put the administrative services under two heads, one for the battle area and one for lines of communication, was done away with. The military railways, which had been hitherto starved, were reorganized, and were generously supplied with staff and material. But what proved in the result to be a mistake in organization was made: railways were separated from the control of the quartermaster-general (who kept control of other forms of transport), and put under an independent directorate of transportation. Thus the commander-in-chief had two separate transport authorities to deal with.

There followed after the battle of the Somme a period when the line was practically stable for a long period; and whilst the almost stationary trench warfare continued, the weakness of this division of authority, and the mistake of allowing any but the military idea to rule in an essential part of the army organization, were not apparent. When the Germans attacked in the spring of 1918 those errors showed very clearly, and the railways had to be brought again under the control of the quartermaster-general, after an interval during which they were under a committee of the staff. But the transport situation then was very critical. The German advance had brought the British front lateral line—St. Just–Amiens–St. Pol-Hazebrouck—under shell-fire at many points. The Germans, whose strategy under Gen. Ludendorff was dominated largely by transport considerations, sought to paralyze completely the whole railway system by continuous air-attack on the British rear lateral—Eu–Abbeville–Etaples,—especially at the points where it crossed the rivers Canche and Somme. Whole-hearted work in building "avoiding" lines and bridges, and the efforts of the motor transport, just kept the position in hand until a British advance in front of Amiens relieved the front lateral. It was a happy circumstance that a new quartermaster-general of the British army in France, Lt.-Gen. Sir Travers Clarke, had just brought to completion the building up of a G.H.Q. reserve of motor lorries. He thought in the winter of 1917–8 that the battle of Passchendaele had exposed a weakness in light railways—that they had to work along defined tracks which could be intensively shelled by the enemy. The British army therefore decided to trust more to the motor transport. There was effected a complete reorganization of it, with the central idea of doing away as far as possible with the "earmarking" of motor vehicles for particular units or particular tasks, and making its total strength completely mobile and liquid. Vehicles saved by this "pooling" were formed into a G.H.Q. Motor Reserve. This proved of great strategical benefit in the spring of 1918. The G.H.Q. Motor Reserve was able then to take up part of the traffic load, and was largely responsible for saving the situation. There were lorry drivers who held the wheel for 36 hours at a stretch, and were lifted from their seats fainting or asleep; a few—who carried on until no longer able to see through their bloodshot eyes—ran their cars into trees or walls or ditches. There were many casualties, but the situation was saved at a time when the railways could not meet the work of supply.

Passchendaele, terrible ordeal as it was for the British army, gave valuable hints as to the proper place of light railways in an administrative system. Light railways at one stage of the war were perhaps over-estimated. There was an inclination to regard them as all-sufficing. The British administrative services ultimately gave them their proper rôle, recognizing that they were most valuable when the line of battle was stabilized for some length of time, but tended to be less valuable as the war became one of movement. In the spring of 1918, the British army had 920 m. of light railways in operation; in the summer 100 m. less. Its great advance was planned on the principle of concentrating labour upon pushing forward the broad-gauge railways and the roads forward from them, trusting to motor transport and to horse transport to carry on the load from broad-gauge railhead. Earlier in 1918 controversy on the subject was keen, and the French were inclined to take a differing view. The Germans, of course, were tied to light railways, for they had not the means to extend their motor traction. The position on Nov. 11 1918 seemed to justify the British view.

By the summer of 1918 the British administrative services were so confident of their machine that they were supporting strongly in favour of trying for a "knock-out blow" as against the alternative plan of devoting the winter to final preparation for an overwhelming campaign in the spring of 1919. "Administration" covered at this stage a wide scope. It arranged the supply, from England, and from its own workshops and local civilian workshops, of all the varied equipment of the forces, from a tank and a 15-in. howitzer to a tin of dubbin. There came to the ports of France every month for the B.E.F. about 800,000 tons of material. The men to be fed totalled over 2,000,000 and the animals about 500,000. The transport system in addition to half-a-million horses and mules, had about 20,000 motor lorries running over 9,000,000 motor miles per month; it carried on its light railways about 544,000 tons a month, and ran every day 250 trains on its broad-gauge lines. It was constantly building new railways and new roads, and developing new harbour facilities. It ran canal and sea barge services, forestry and agricultural services, and repair shops, on a gigantic scale. It supplied the medical stores for wounded and sick, the veterinary services, the laboratories for the defence of men and animals against poison-gas and for the gas counter-offensive. In the last year of the war it produced timber from French forests for four-fifths of its total needs. It grew vegetables and other food and fodder stuffs, and helped as tiller and harvester in the French fields (in 1918 it saved the crops on 18,000 acres, harvesting at night, the soldiers having to work sometimes in gas masks). It was its tailor, bootmaker, laundryman and even ragpicker. The soldier on going out of the line had clean underwear waiting for him at his divisional baths; his soiled garments were disinfected, cleaned and repaired for reissue; his socks darned, buttons replaced, rents patched; and the garment beyond repair was shipped away as rags for the shoddy mills of Dewsbury.

This administrative army was caterer for men and horses. The civilian world throughout Europe might be suffering from scarcity of food supplies, but to the very last the British soldiers and horses enjoyed good rations. This was only made possible by an organization that eliminated every form of waste.

As banker this administration dealt with every currency and note-issue of the world. It had savings banks and an investment organization for British troops, and even special savings banks for the Chinese. It insured its civilian labourers against death and accident; it negotiated the payment of *octroi* to towns where its troops were stationed, and paid compensation of French property owners for the leases of their lands and buildings and the war damage to their property.

The Complexity of Administration.—This wide range of activities, though it had to be carried on under conditions which varied from day to day, fell with minor variations into three main categories. (1) *Maintaining a stabilized position.* This was comparatively easy. The traffic demand was known. Wastage of horses and material could be calculated with some certainty and replaced by a routine process. (2) *Preparing a big attack.* This made the greatest strain on transport and supply, and the necessary conditions of secrecy added complications. In preparing an offensive the traffic tonnage more than doubled per division. This was due to the necessity for making new railways and new roads, and the accumulation of defence material to fortify a new line. But the accumulation of ammunition was also a factor. On a quiet sector two divisions could be served by three trains daily. For the preparation of a big attack ten divisions might be concentrated on that sector, and those divisions in the preparatory stage of the attack would need about 33 supply trains a day, and during the offensive about 27 trains a day. And these trains would carry material only to broad-gauge railhead. After that most of it had to go farther forward by light railway, motor and horse traffic, and in some cases even by the "Yukon pack," *i.e.* by man porterage. (3) *Resisting a big attack.* The difficult element here was its unexpectedness. The amount of supplies per division necessary to go up from base would be 25% less than in the case of the preparation of a big offensive. There was always carried a good reserve of ammunition, food and engineering stores, close behind the line, and a further reserve of ammunition already loaded on trains at appropriate railway centres. In case of emergency, ammunition could start to move up as soon as a locomotive could be coupled to a standing train. The German offensive in 1918 showed that the British carried near the front line too great reserves, and there were unnecessary losses in food, stores and ammunition, as a consequence. Forward "dumps" were thereafter reduced.

The organization at the front in 1918 to cope with this work in the British army, had at its head the quartermaster-general (Lt.-Gen. Sir Travers Clarke) and two deputy quartermaster-generals (Maj.-Gen. Ford and Maj.-Gen. May). The headquarters staff consisted of about 40 officers, and the detailed work was divided under the following departments:—Director of Agricultural Production (Brig.-Gen. Earl of Radnor); Director of Army Postal Services (Brig.-Gen. Price); Deputy Controller of Canteens (Col. E. Benson); Director of Engineering Stores (Brig.-Gen. Sewell); Director of Forestry (Brig.-Gen. Lord Lovat); Director of Hirings and Requisitions and President of Claims Commission (Maj.-Gen. L. B. Friend); Controller of Labour (Brig.-Gen. Wace); Director of Ordnance Services (Maj.-Gen. Sir C. M. Mathew); Paymaster-in-chief (Maj.-Gen. Sir C. A. Bray); Director of Remounts (Brig.-Gen. Sir F. S. Garrett); Controller of Salvage (Brig.-Gen. Alexander Gibb); Director of Supplies (Maj.-Gen. Carter); Director of Motor Transport (Maj.-Gen. Boyce); Director-General of Transportation (Maj.-Gen. Crookshank); Director of Veterinary Services (Maj.-Gen. Moore); Vice-Chairman Imperial War Graves Commission (Maj.-Gen. Fabian Ware); Director of Works (Maj.-Gen. Sir A. M. Stuart). Subsidiary directorates under the Director-General of Transportation were:—Director of Construction (Brig.-Gen. Stewart); Director of Docks (Brig.-Gen. Wedgewood); Director of Inland Water Transport (Brig.-Gen. Luck); Director of Light Railways (Brig.-Gen. Harrison); Railway Traffic (Brig.-Gen. Murray); Roads (Brig.-Gen. Maybury).

A comparison of this organization with the French administrative services would suggest that the British was over-elaborate. But consideration must be given to these important facts: that the British army was operating in a foreign country, and moreover in the country of an Ally where there must be the least possible friction with the inhabitants; that by custom both men and animals in the British force required a particularly generous ration; that the British force expended far more ammunition than the French, and in its campaign methods kept up a permanent minor offensive even on quiet sectors, as was not the custom with the French. When in the course of the operations early in 1918, French and British troops were intermixed in the battle line, it was found by experience impracticable to supply British units through the French system, and, except as regards such items as hay and petrol, which were kept in a common pool, the supply and transport had to be duplicated, a British system being set up side by side with a French.

Salvage.—An account of the administrative system in the World War would be incomplete without some reference to the salvage activities of 1917–8. The submarine war began to have its cumulative effect just when there came the most peremptory reminders that supply was going to be the determining factor of the final struggle. Munitions, food, equipment, railways, roads, ships—these had become the most important factors, and victory would incline to the force which could best concentrate the means to maintain an overwhelming force at some particular point, and could best develop, conserve, and transport its material. From 1915 to the middle of 1917 it was only necessary for the British army to ask and it received. Later in 1917, and in 1918, there came requisitions which could not be met. Just before the German attack in 1918 (to give one example) there were desperate calls for barbed wire, to make up an actual shortage of 8,000 tons in the minimum requirements for safety; but it was not available. In food, forage, clothing, timber, metals, the world-shortage had now become acute. The administrative services of all armies sought to better their position, in Europe, by the organization of a department of salvage. As the British salvage department explained, "the shortage of almost every kind of raw material used for war supplies makes salvage an important administrative service. Without a well-organized and thorough salvage system, the full maintenance of our force in the field would be made difficult. . . . The salvage organization is not intended to take the place of, or in any way discourage, a consistent effort on the part of every supply department to recover for repair and re-issue its own articles and its own empties. It is intended to supplement that effort; to collect and put to use what would otherwise become derelict; to insure that nothing utilizable is allowed to go to waste. . . . There is nothing of the debris of the battlefield which we cannot put to some use." Some of the items of salvage values taken from a monthly return show the wide range of the department—swill for piggeries, £600; solder from old tins, £300; cotton waste, £500; tin-plate (won by unrolling old biscuit tins, etc.), £2,500; old lead, £400; various by-products £200,000. The old rags collected did a great deal to help the cloth shortage at home. The old bones collected made glycerine for explosives. In Sept. 1918 the British army saved £4,000,000, and the American army £3,000,000 by salvage.

The Animals of the Force.—The administration of the animals of the British force—the largest mobilization of animals known to history—calls for a special note. The worst difficulty in their case was mud. From early in autumn until late in spring the mud season lasted. Off the *pavé* roads all the fighting area of Flanders was semi-liquid, and the problem at horse-lines was first to secure a solid "standing," next to secure a solid road in and out to that standing, and finally to secure a solid road to and from a solid watering-place. Standings were usually made of bricks, and the army requisitioned all the brick yards in the occupied area. Shell-ruined villages were another source of brick supply. The bricks had to be set properly; rubble was lost in the soil within a week. Losses from enemy action were not very high among the animals until the last phase. There was little cavalry work except at the end of the campaign and at its very beginning. But horses and mules suffered greatly when the enemy began to use mustard-gas (1917–8). The ground where a mustard-gas shell had fallen was infected for long afterwards. If horses were picketed on it, or even passed over it, casualties were high. The irritant poison of the gas attacked their hoofs and their skins wherever the hair was thin and caused sloughing wounds. An effective curative treatment was found in a dressing, the chief ingredient of which was chloride of lime. From the spring of 1918 the animals suffered severe attacks from the air. The enemy devoted much of his air-force to bombing attacks on horse-lines, with a view to lessening British transport strength. At first these attacks had serious effects. Then horse-lines were camouflaged; the animals were separated into small groups; the lines were protected by bomb-proof traverses of earthwork, which localized the effects of explosions. In the summer of 1918 the wastage of animals by sickness had been cut down to a very low rate (7·7%), as the result of skilful horse-mastership. At this time forage difficulties were acute, but there had been close organization for grading fodder in army and line-of-communication areas, and the animals always had sufficient rations. British administration was able to take a considerable part of the burden of horsing the American units which arrived in France in 1918. Nearly 25,000 animals were made available by reductions of the horse-strength of artillery units. A further 14,000 were saved by giving 6-in. howitzer and some 60-pounder batteries mechanical transport. Another means of economy in horse flesh was the setting up of a "category B" for animals which were not quite fit for arduous work with a fighting unit, and were withdrawn to units whose demands on them were less exacting.

Some Comparisons.—As between the three administrative machines, the French, the British, and the American in the autumn of 1918, certain points of difference may be noted. Both French and American systems still kept a dividing line as regards administration between the base and the fighting line. The British system had abolished this (together with the post of Inspector-General Lines of Communication) in 1917. The French divided the zone of the armies into the zone of the advance and the zone of supplies (with sometimes an intermediate zone). In the zone of their advance administration was in charge of the *Aide major-général chargé de la direction de l'arrière* at G.H.Q. But his administration had no functions of procurement, only of distribution. In some points of administration the dividing line between the zone of advance and the zone of supplies was abolished; *e.g.* all motor transport and all light railways, wherever operating, were under a D.A. at G.H.Q. The French system of supply and distribution was fashioned for war in the home-country or near to it; when it was transplanted (for instance, to Salonika) it had to be modified somewhat on the lines of the British system. The American system put administration in the fighting line under an assistant chief-of-staff (G.4) at G.H.Q.; and on the lines of communication under a general commanding S.O.S. (corresponding to the former British I.G.C.). Under the American system the chiefs of the supply services were not at G.H.Q. but at the H.Q. of S.O.S. With both the French and the American systems evacuation and hospitalization of casualties were purely "Q" services: in the British army they were under the adjutant-general assisted by the quartermaster-general. Some other differences came from geographical reasons. France itself was really the supply-base for the Americans, whereas the British had the United Kingdom for this purpose; so the Americans held great stocks in depots—15 days of supplies in advance depots, 30 days supplies in intermediate depots, 45 days supplies in base depots. The American army naturally relied more largely on local purchases (from the Allied armies and from European civilian sources) than did the armies with their home bases nearer at hand. General Pershing founded a general purchasing agency to control these purchases. In 1918, out of 17,600,000 ship-tons used by the American army only 7,600,000 tons came from the United States and 10,000,000 tons were purchased locally, and to the end of the campaign the American army drew largely upon British and French supplies.

The British administrative machine in one particular point was inferior to the American machine in 1918. Under the British system the navy had control of all supplies by ship until they left the transport. The navy could put a supply-ship into any port it pleased, and naturally was guided chiefly by shipping considerations. Thus supplies for the southern area might go to a northern port. The American system put the supply ships under army direction when they came within the three-mile coast limit, and they could be directed to the port of supply which was most convenient from the army point of view. The French and the Americans used the railway regulating stations as depots; the British used them as sorting stations only. The British used the base-ports for sorting goods to a great extent; the Americans did not. In the autumn of 1918 the Americans found their one great depot, and sorting and regulating station, at Is-sur-Tille insufficient for the needs of their growing army, and they were proceeding with the organization of another station when the Armistice came.

The general staffs of the various combatant nations were in 1921 still working out the lessons of administration as taught by the World War. One principle seems to be generally accepted, that it is wise to centralize as far as possible all administration under one staff officer over the whole war area, trusting to him to devolve and coördinate. That was the final principle of the organization of the administrative services in the British army in 1918. In the first phase of the war the French organization did a large portion of the work of transporting the British army and its supplies. As the British force grew in strength, and the problem of its administration grew in complexity, the experiment was tried of dividing responsibility between the quartermaster-general of the force and the G.O.C. lines of communication. "Q" tasks were under different control in battle areas and at the base. This did not work satisfactorily, and the next experiment was to divide responsibility between the quartermaster-general and the director-general of transportation (the latter having control of the broad-gauge railways, the former of all other transport). This arrangement broke down in the spring of 1918, when the British army was put into serious jeopardy through the transport situation; retirement south of the Somme had to be contemplated, at one stage as probable, and the details were actually arranged for the destruction of the ports of the Pas-de-Calais so as to deny their use to the Germans. In the summer of 1918 the British administrative services from the coast line to the trench-line were put under one head, the quartermaster-general, for experience suggested that the commander-in-chief should have one man to whom he could confide the responsibility of the administrative side of his army's operations: to divide the responsibility was not to simplify but to complicate the task. (F. F.)

SURVEYING (*see* 26.142*).—The most striking feature to be recorded in connexion with surveying generally is the greatly increased importance which it acquired during 1910–20 from a military standpoint. This was chiefly due to the stationary character of the World War on the western front, but other factors contributed, notably the introduction of air-photography. The use of photographs, taken from aeroplanes, to determine the position of enemy trenches and other detail inside the enemy's lines, made a considerable difference in the technique of modern war and reacted upon the methods of peace-time surveys. But not only photographs from the air, but also photographs taken on land have been pressed into the service of surveying, and the applications of photography to surveys of mountainous regions such as the higher Himalayas have been greatly extended.

In exploratory surveying the conditions have been changed and simplified by the introduction of wireless telegraphy, for the determination of longitude; the accurate fixing of his longitude, long the explorer's bugbear, is now no more difficult than taking a latitude. In the more regular branches of the subject the principal matter demanding attention is the development (in which many countries have taken part) of accurate methods of levelling, particularly of precise or geodetic levelling.

Surveying in War

Geographical and topographical surveys are well known adjuncts to military operations. The war of 1914–8 showed that all other classes of land surveying, *i.e.* geodetic triangulation, levelling, and large scale surveying may be called upon to assist in the development of scientific and mechanical warfare. It is not possible to forecast whether future developments may demand an enhanced accuracy of survey, or whether the increasing importance of aviation, amongst other factors, may not prevent a recurrence of the stationary operations which prevailed over the western front for four years. A description of the more important duties of the Survey battalions on the western front, offers the best record of an intensive large scale military survey.

The Trigonometrical Control.—The extent of the line, liable to periods of intense activity throughout its length, and the constant changes of army and corps fronts made it necessary to provide a homogeneous and complete system of triangulation upon which to base the maps and the local surveys called for.

Five separate and distinct triangulations already covered this area before the outbreak of war, viz:—

1. The French main arcs and subsidiary triangulations of 1800–50.
2. The new French Paris meridian and Amiens parallel and their subsidiary orders of 1890–1900.
3. The French Admiralty coastal triangulation.
4. The Belgian national triangulation.
5. The German national triangulation.

All these triangulations were eventually combined into a single coherent system, but not until just before the Armistice and too late to assist in operations. The surveyors of the various armies kept in the closest touch with each other, but discrepancies arose nevertheless, and time was wasted in fresh observations and recomputation. It was realized somewhat late that the adjustment of the discrepancies of local triangulations is the best preliminary to military surveys.

Many of the stations of the triangulations enumerated had been destroyed or built over before the war and many were destroyed during its progress. Numbers of new stations had, therefore, to be established and the trigonometrical observer was employed in intersection and interpolation, rather than new triangulations.

This patched and reconstructed triangulation stood then as a basis for all the military surveys of the western front.

Provision and Issue of Maps.—The British Expeditionary Force took the field equipped with the 1/80,000 *carte de l'état major* of France and the British 1/100,000 maps of Belgium. Topographical maps of this sort were accurate enough for mobile operations in which no heavy guns were employed. Directly the operations tended to become stationary first on the Aisne, and then in Flanders, staff, gunners, and infantrymen demanded a map of such accuracy and

---

scale that administrative arrangements, lines of fire, and trench systems could be shown upon it. Such a map did not exist except in the Belgian area, and elsewhere had to be made. The earlier war surveys were made upon the plane table on a scale of 1/20,000 and were completed up to the British trench lines. The subsequent development of air-photography, and the discovery of the manuscript sheets of the cadastral communal surveys, made it possible to compile reliable maps, not only of territory in British occupation, but of all that portion of north-eastern France occupied by the German armies.

The trench zone was mapped on a scale of 1/10,000, and forward and back areas at 1/20,000. In all 6,000 sq. m. were surveyed.

A reliable map of the physical and artificial features of the country is not sufficient in itself. The positions of defensive works of the enemy batteries, of the points of administrative importance, and of many other objects must be shown on frequently recurring editions. From 12 to 20 editions embodying such information on various scales were kept up for the actual area of operations, whilst during the progress of a battle daily editions were brought out.

To cope with this volume of printing it was found necessary to provide for the rapid reproduction of trench maps at the Ordnance Survey Office at Southampton and for small but complete lithographic establishments in each army and at G.H.Q. Zinc plates were prepared by the Vandyke process or by helio-zincography, and flatbed printing machines, preferably motor-driven, were used for printing in the field. The French and German armies had well-equipped printing trains which were used for increasing printing facilities in important areas. The French, for example, dispatched a printing train to Italy in 1917. Towards the end the Americans employed a well-designed printing plant in lorries.

A scale of issue of about two copies per officer engaged, of each important map, was maintained, but experience showed that this scale should be increased. During the whole period of operations about 34,000,000 maps were printed for issue to the British troops, of which about two-thirds were printed by the Ordnance Survey in England and a third in France.

For the use of large scale maps in trench warfare a well-thought-out system of coördinates, based on a suitable projection, was needed. It must be possible to read off at sight the coördinates of any desired point from a "grid" or network of lines printed on the map. All the armies had such systems. Experience proved that for ease and accuracy of reference the "grid" should be in squares, the sides of which can be divided decimally by eye. The artillery often desire coördinates of the same accuracy as the surveyor—*i.e.* on the scale of nature. The system adopted should therefore be based upon the coördinates used by the surveyor, with an easy form of abbreviation to be used by all arms to define map positions. Accuracy of bearing from any one position must be maintained together with as near an approach to linear accuracy as possible, whilst the system must allow of extension over the whole area of operations.

The considerations which influence the choice of a reference "grid" have already pointed to the desirability of an orthomorphic projection. For the conduct of surveys constantly in progress it is equally important. Computations must be cut down to the minimum, and this is best secured by working on a projection in which the position on the ground and the position on the map can be calculated in one process without sensible error.

From the cartographic point of view the question is not so important, and there are many projections which would provide a sensibly accurate map over large areas.

It was decided late in the war to adopt an orthomorphic projection with two standard parallels which had recently been adopted in the French armies, but the decision came too late, and the Bonne projection continued in use in the British army until the Armistice.

Surveys for Artillery Purposes.—Other things being equal, that artillery will dominate its adversary which has the quickest and most accurate knowledge of hostile battery positions and which can open most quickly an accurate and unexpected fire upon them. The construction and calibration of guns and howitzers, the homogeneity of ammunition, and the measurement of those atmospheric elements which affect ballistics are involved; but accurate survey of the relative positions of gun and target is essential.

The positions of British heavy batteries were, therefore, fixed with a theodolite, each battery was supplied with a chart or "artillery board" on which the map was pasted down, in sections, upon a zinc or three-ply wood surface, and special "bearing pickets" were inserted in numbers in the battery zone. The bearings from these pickets to surrounding objects, suitable as reference objects, were tabulated and distributed.

The positions of hostile batteries were also surveyed with as much dispatch and accuracy as possible by one or other or both of the following methods:—

(*a*) Intersection of three or more rays observed upon the flash of discharge, the reflection in the sky of this flash, or, upon the smoke puff from the muzzle. This operation, commonly known as flash spotting, was carried out by units, each of which manned four survey observation posts, or instrument stations, and one headquarter post. Each section had its own internal telephone system and was in direct communication with an artillery headquarters.

Observations were directed by an ingenious controlling exchange upon hostile guns in succession. This method, independent of the map, gave very good results but depended for success upon good visibility. Flash-spotting units could survey the positions of the bursts of our own shell and were, therefore, also used extensively for ranging and for calibration.

(*b*) *Sound-ranging.*—A sound, in still uniform air, spreads outwards from its origin with an equal velocity in all directions, and the sound waves may therefore be likened to the ripples spreading outwards on a pond from the point at which a stone has fallen into it.

If we now imagine a row of surveyed pegs, more or less tangential to a ripple, projecting from the surface of the water, if we measure the times at which the ripple strikes each peg and know the velocity of the advance of the ripple we shall have all the data necessary for fixing the position of the origin of the disturbance. All armies engaged on the western front had some system for determining the position of a gun from the sound of its discharge, embodying the above principle. It is unnecessary here to describe the British system, except in so far as the survey of the sound-receiving stations is concerned. A sound-ranging base was generally, though not invariably, laid out on the arc of a circle, the centre of which lay in the zone of the enemy's heavy artillery. There were usually six sound-receiving stations about 1,000 metres apart. The coördinates of the selected spot for each station were computed in the office, and the surveyor had to find and mark the corresponding points on the ground. Errors of more than one metre in position resulted in sensible errors in sound-ranging.

Sound-ranging is naturally unaffected by bad visibility, but is put out of action by a moderate wind blowing from base to gun and is interfered with by any high wind. As in the case of flash spotting, a good telephone connexion to the artillery headquarters is essential.

Surveying by Air-photography

Air-photography, or, to be more precise, photography of the ground from the air, has been recognized as a possible method of survey since the middle of the 19th century.

Experiments in photographing the ground from balloons had been made by Col. Laussedat, Major Elsdale and others from 1859 onwards, but air-photographs played no part in any important survey before the outbreak of war in 1914. During the course of the war the difficulty of producing maps on medium scales was enhanced by the inaccessibility of the most important areas. It was due to this fact, and to the development in 1915 of photography from aeroplanes, that large areas in many theatres of war were mapped by the aid of air-photographs. But no full examination of the possibilities was made, and for peace surveys the method still remains in the experimental stage.

Optical Principles.—Provided that the optical axis of the camera is vertical at the moment of exposure, the resulting photograph of a flat level area will be an accurate plan at a scale determined by the equation

$$\frac{f}{h}=s$$

where f is the focal length, h is the height of the camera above the ground at the moment of exposure, s is the representative fraction of the scale.

Such photographs will be called vertical photographs. As a rule, however, the photograph is not exactly vertical, but the axis is tilted at an angle to the vertical. The photograph then becomes an inclined perspective view. (*See* Fig. 1.)

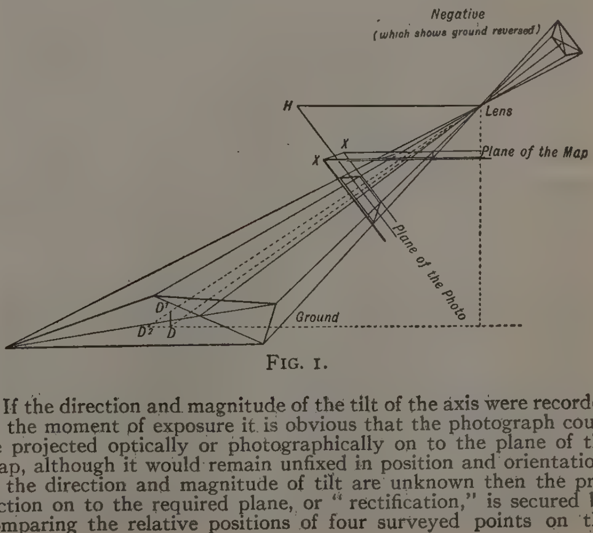

FIG. 1.

If the direction and magnitude of the tilt of the axis were recorded at the moment of exposure it is obvious that the photograph could be projected optically or photographically on to the plane of the map, although it would remain unfixed in position and orientation. If the direction and magnitude of tilt are unknown then the projection on to the required plane, or "rectification," is secured by comparing the relative positions of four surveyed points on the ground and on the photograph, which is then also fixed in position and orientation. Where the tilt is known, approximately three points common to map and photograph will furnish a solution. Two further points of importance are that (1) straight lines upon a plane remain straight lines upon any perspective view of that plane; (2) at any point on an inclined perspective view the scale is not the same in directions parallel to and perpendicular to the axis of tilt.

In plotting detail from vertical photographs certain errors, due to instrumental imperfections, may arise but are seldom of sensible magnitude. These are due to (1) a change in the relative position of plate lens and area photographed, due to the shutter moving so comparatively slowly that the movement of the aeroplane becomes noticeable on the plate; (2) distortion due to optical imperfections of the lens.

Construction of the Map.—In order to explain how a map is built up, wholly or partly, from air-photographs it is advisable to take some illustrative cases. The simplest case is where it is desired to produce a map of an area in which a sufficient trigonometrical control already exists and of which there is available a complete collection of cadastral plans, which are, however, much out of date. Ground features are low and gently undulating, extreme difference of altitudes being two or three hundred feet only.

In such a case topography can be brought up to date from air-photographs taken with the axis as nearly vertical as possible, and fitted upon the cadastral framework by one or other of the methods described below. When this is complete the map is contoured in the field, names are added and the topography examined for omissions or mistakes.

The most difficult case arises when the area to be mapped is rugged and mountainous, and the inhabitants hostile: the positions and heights of a few peaks in it, visible from accessible ground, have been fixed trigonometrically, but no reliable map exists.

As a preliminary measure oblique photographs are taken from a variety of points of view. The positions of the camera in space are calculated, and from measurements on each photograph a number of rays are drawn to noteworthy points in the valleys and on the hills. Positions and heights are thus determined for a subsidiary control. With the axis vertical a series of photographs of valleys and of watersheds are taken, pasted together, and fitted to the control. When the map has been thus built up, form-lines are added from the oblique photographs and upon the fixed heights. In the majority of surveys difficulties will be of an order intermediate between those of the foregoing two cases.

Applications of Air-photography.—In any particular survey air-photographs may be used then for any or all of the following processes, viz.:—(1) Air-photo control, (2) Air-photo-topography, (3) Air-photo contouring.

In taking vertical photographs for air-photo control, exposures are so regulated as to ensure a substantial overlap, generally amounting to 50% at least. Each successive photograph may therefore be fitted to its predecessor, and lines or traverses of photographs may be mounted and scaled between fixed points. Any two or more traverses of different and independent lines may be made to intersect over some topographical object, the position of which may be determined as the simple, or weighted, mean of the individual positions from each traverse. Traverses may also be made to converge and end upon some prearranged and hitherto unfixed object. This method has given fairly accurate results in flat country on the scale of 1/40,000, and is dependent upon the ability of the pilot to maintain an even keel and a constant height.

In broken and hilly country no method can be regarded as trustworthy which does not take into account differences of altitude. We must then be content to limit the use of each photograph to the measurement of horizontal and vertical angles and to fix the positions of new points by intersection from two or more photographs. Where this principle is decided upon there remains no advantage to be derived from the vertical photograph, and oblique photographs are used in preference as covering larger areas and allowing greater refinement in the measurement of vertical angles.

The first stage of this photo-topography from the air is to interpolate the position of exposure in space from three or more points, the positions of which on the earth's surface are known, and which appear on the photograph. If we consider the pyramids whose apices are the lens and the bases of which are the triangles formed by the three fixed points respectively on the ground and on the photographic plate (*see* fig. 2), we see that (*a*) the angles at the apex are a function of the lengths *ab*, *ac*, *bc* (which can be measured upon the plate), and of the focal length; (*b*) the inclination of the ground pyramid to its base is determined by the direction and magnitude of tilt; at the present time there are no means of measuring accurately the tilt of the plate at the moment of exposure, and calculation follows by successive approximations from a preliminary estimation; (*c*) the position of O in space can be calculated and plotted in its correct projection on the plane of A, D, C; (*d*) angles may be measured upon the plate and rays drawn to additional points from O.

From the nature of the case air-photo control must be limited to the provision of a few supplementary points.

Where the area to be mapped contains a sufficiently close control the filling in of topographical detail is more easily done from vertical than from oblique photographs, providing that the area in question is not markedly hilly. The scale on which photographs are taken may be larger or smaller than that of the map, but it must be sufficiently large to allow of clear identification of detail.

The area to be mapped is photographed from a prearranged height in strips allowing for an overlap in all directions. Much depends upon the training of the pilot in maintaining his height and his overlap. It is usual to arrange for a mechanical control of exposures regulated according to the ground speed of the aeroplane.

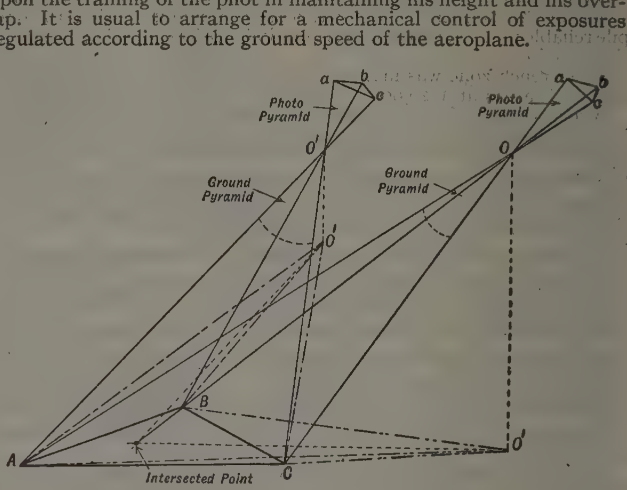

FIG. 2.

The plotting of detail from these photographs would be simple if the axis of the camera could be maintained in a vertical position. It would then be necessary only to bring the photograph to the scale of the map. No means of ensuring this verticality has, as yet, been evolved. It often becomes necessary, therefore, to fit photographs individually upon the control points. This can be done graphically, or optically by the *camera lucida*, or by the enlarging camera.

The graphic method depends upon the principle that as straight lines on one plane remain straight lines on any perspective of that plane the position of a point which lies upon the intersection of two lines common to the ground and to the photograph may be readily determined. Within narrow limits the proportional compass set to the difference of scale between map and photograph at this point may be used to fix additional points. It is more accurate, however, to maintain the straight line principle and to cover the map and photograph with a "grid" of corresponding lines, as in fig. 3.

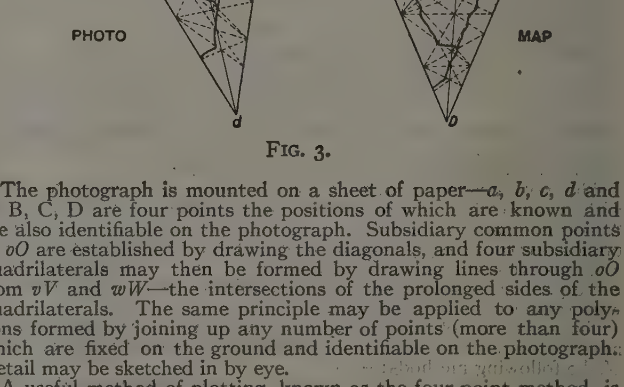

FIG. 3.

The photograph is mounted on a sheet of paper—*a*, *b*, *c*, *d* and A, B, C, D are four points the positions of which are known and are also identifiable on the photograph. Subsidiary common points at *o*O are established by drawing the diagonals, and four subsidiary quadrilaterals may then be formed by drawing lines through *o*O from *v*V and *w*W—the intersections of the prolonged sides of the quadrilaterals. The same principle may be applied to any polygons formed by joining up any number of points (more than four) which are fixed on the ground and identifiable on the photograph. Detail may be sketched in by eye.

A useful method of plotting, known as the four-point method, is as follows (fig. 4): It can be proved that the cross ratios of four points which lie upon a straight line are the same upon any perspective view of that line, hence we can readily plot the position of a fifth point (S) if we know the positions of four points A,B,C,D.

Let A, B, C, D be four known points on the photograph and *a*, *b*, *c*, *d* their positions on the map, and let S be a point on the photograph the position of which on the map is to be found.

Join A B, A C, A S, and A D, *a b*, *a c*, and *a d*.

Lay a piece of paper with a straight edge, in any position cutting the lines A B in B′, A C in C′, A S in S′ in A D in D′ and mark these cutting points on the paper.

Now lay the paper strip on the map and fit it upon the lines *a b*, *a c*, and *a d*, so that B′, C′ and D′ lie upon these lines.

Mark on the map the position of a point *s*′ opposite the mark S′ on the paper strip. Join *a s*′. Then *s*, the position of point S, upon the map, lies upon the line *a s*′.

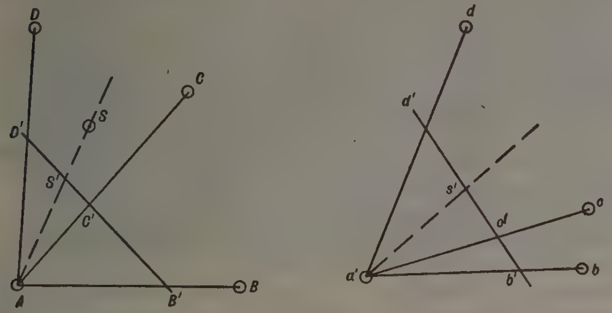

FIG. 4.

Repeat this proceeding from B, C, or D, and another line *b s*′, *c s*′, or *d s*′, will be secured, the intersection of which with *a s*′ will define the position of S.

The *camera lucida* (*see* 5.104) has been used extensively for plotting. The upright carrying the prism is mounted on a stand upon which are also mounted two boards roughly at right angles to each other called respectively the map and photograph boards. Movements are added to allow of rotating the photograph in its own plane, of tilting the map (or tracing of control points) around an axis parallel to a marked horizontal line on the photograph board, and of increasing or decreasing the distance between the prism and the photo board (fig. 5).

FIG. 5.

Graphic and optical methods are tedious and lengthy compared with a photographic rectification. The ordinary enlarging camera can be made to answer the purpose with little modification. It must provide, in addition to its focussing movements, as follows:—

1. The negative must be capable of rotation in its own plane around its centre.
2. The copying board and negative carrier must be capable of rotation around parallel axes which are at right angles to the optical axis of the lens.
3. The copying board and negative carrier must be capable of movement along the line axis of the lens.
4. The negative carrier must be capable of a movement bodily at right angles to its axis of rotation.

By means of these movements a coincidence can be obtained between the four control points on the map and on the photograph, and a "rectified" print may be obtained.

Little contouring has as yet been based on air-photographs. It must be recognized at the outset that it is impossible to calculate relative heights from measurements taken from a single photograph; for the accurate determination of relative heights we must have at least two photographs taken from different places. An outline of photogrammetry from the air has already been given and mention has been made of interpolation in space, and of the survey of new points by intersecting rays. A short additional step—the measurement of vertical angles on the plate—makes it possible to calculate the height of these new points.

Stereo-photogrammetry from the air may develop in the future, but has not been made use of hitherto. On the other hand much use has been made of the stereoscopic effect visible on two photographs of the same area taken from different positions. Such information is not of an exact nature but gives a valuable indication of ground forms and brings out the system of drainage.

Until 1920 mapping from air-photographs had been confined almost entirely to war time, and to areas already covered by a trigonometrical control, hence there had been little opportunity of comparing the cost of this method with that of any other, or of laying down definitely its possibilities and limitations. Clearly its greatest value lies in the mapping of inaccessible country.

So far as can be judged, the chief fields of usefulness open to air-photo-topography are, the surveying of native towns on scales of about 1/10,000, or 6 in. to 1 m.; the surveying of deltas and intricate water channels; and the surveying of ancient sites, on which the indications of a former civilization become far more evident in the air than on the ground. Topography on ordinary small scales, and accurate large scale cadastral mapping are, so far, ruled out. But it appears that developments may very well be looked for in each of these directions.

Photographic Surveying

The idea of applying photography to surveying was originally due to Col. Laussedat (1819–1907), who made some experiments in the matter in 1859, and continued during his long life to expound and develop the method. Although the system originated in France not much was done in that country in the way of its practical application, and, if we except some minor work by MM. J. and H. Vallot in the Mont Blanc region in 1892 and some similar mapping by M. Flusin in 1905, it is to Canada that we must go for its first use on any considerable scale.

In 1895 Mr. E. Deville, surveyor-general of Dominion Lands, published his important work on photographic surveying, which remains a complete exposition of the subject if we exclude some recent departures. Between 1886 and 1892 photographic surveys were confined to the Rocky Mts. in the neighbourhood of the Canadian Pacific railway, but in 1893–4 the method was used by Mr. W. F. King in the survey of the Canada-Alaska frontier. In 1901–2 Mr. A. O. Wheeler carried out a very successful photographic survey of the Selkirk range, British Columbia, on the scale of 1/60,000; this was published, with an interesting account of the range, in 1905.

In the U.S. photo-topographic surveys had been made use of on the International Boundary Survey and reports made by Mr. M. A. Flemer of the U.S. Coast and Geodetic Survey in 1897–8. Stereo-photo surveys (*see* below) were employed in the survey of Tutuila, Samoa, by the U.S. Hydrographic Office in 1916; and an innovation in the shape of a panoramic camera was first used by Mr. C. W. Wright in Alaska in 1904 and extended by Mr. J. W. Bagley who wrote an important treatise on the subject in 1917 (Washington, Government Printing Office).

In 1907–8 Lt. M. Weiss, of the expedition commanded by Duke Adolphus of Mecklenburg, made a photo-survey of the volcanic Mfumbiro Mts. to the N. of Lake Kivu. Other fragmentary surveys in various parts of the world have been carried out by the aid of photographic methods; most of them, as well as those mentioned above, were in mountainous country.

Outline of the Method.—Assuming that a photograph is a true perspective view, that the plate was vertical when exposed, and that the horizon-line and focal length of the lens are known, it is clearly possible to determine the horizontal and vertical angles from the point where the camera was set up to all objects represented in the photograph, the horizontal angles being measured from some known, represented object. If two such photographs are taken from two points, at known distance apart, we have the means of determining the distance and height of all points shown on both photographs.

It will therefore be necessary in planning a photographic survey, to arrange for a triangulation to fix the relative positions of points at which the camera will be set up, and the first stage in the office work will consist in the plotting of the triangulation. A camera station need not, however, be a trigonometrical point, provided that its trigonometrical position can be measured from the photograph. To use the photographs for plotting the detail, from each camera station A draw, at its correct angle, the central line of view. Along this line draw A x, equal to the focal length of the lens; through x draw a line at right angles to A x and plot from x the projections of the distant points, as measured on the horizon-line of the photograph. The intersection of rays from A to the points so obtained, with rays to the same objects from other stations, will give their positions.

It is an almost universal rule of photographic surveying from the ground to maintain the photographic plate in a vertical position, because any inclination of the perspective plane of the plate adds difficulties to the plotting.

A supplementary order of triangulation is usually added contemporaneously with the field work of photogrammetry, both to fix camera positions and to add a few bearings and vertical angles from which the photographic data may be checked.

For many years cameras specially designed for surveying work have been available, a good example being the Bridges-Lee phototheodolite. The essential features of these are, that the focal length should remain constant (for which purpose the sensitized surface of the plate should be pressed firmly against the frame of the camera), that the position of the optical centre, and of the horizon and principal planes should be deducible from marks on the plate, and that the lens should be free from distortion and aberration. It is also important to provide levels by means of which to ensure the verticality of the plate. The later photogrammetric cameras are either interchangeable with transit theodolites on the same portable stands, carry eccentric telescopes, or else combine the two instruments by substituting a telescopic lens for the usual photographic lens, and by inserting an eyepiece in the back of the camera. The field work demands a high standard of topographic training, for it is not easy to select the minimum number of views sufficient to cover the country whilst leaving no gaps. Valleys and low-lying areas constitute the main difficulty. One or two stations *per diem* are all that have been occupied by the same party in the photogrammetric surveys of the Canadian N.W. frontier, whilst a supplementary triangulation was carried on concurrently.

The office work takes two or three times as long as the field work and consists in plotting positions, calculating heights, and drawing contours from data measured on the developed plates.

The picture trace will naturally assume the form of the arc of a circle if a panoramic camera is used such as that employed during 1910–6 by Mr. J. W. Bagley in Alaska.

There are several plotting devices on the market, such as the perspectograph, but they have not been largely employed. On the other hand vanishing scales and perspectometers (grids showing the perspective on a vertical plane of a series of squares on a horizontal and lower plane) can be readily constructed.

Stereo-photo Surveying.—The most recent development of photographic surveying consists in the employment of the stereoscopic principle. The stereoscope as a toy has long been known, but Dr. Pulfrich of the firm of Zeiss of Jena, and Col. von Hübl of the Austrian military geographical service, conceived the idea of applying the stereoscopic principle to the service of exact surveying. Other pioneers in 1907–8 were the late Capt. F. V. Thompson, R.E., and Mr. Conrady. In 1913 Mr. G. Muller carried out a successful stereo-photo survey for part of the proposed Hankow-Ichang railway. In order to carry out a normal photographic survey successfully it is necessary to arrange for stations far apart and for intersections of some 30 degrees or so. But in stereo-photo surveying two stations can be occupied on the same hill-top and their distance apart need only be some 50 to 300 feet.

In the simplest case let two vertical photographic plates be exposed from two points, say 100 ft. apart; let the plates be in the same plane and their centres on the same level. Then if these plates are put into a stereoscope provided with a system of lenses and prisms such that the eyepieces are brought to a convenient distance for seeing, we shall clearly get a very much magnified stereoscopic effect as compared with what is obtainable with the naked eyes. In the diaphragm of each eyepiece let there be a similar movable mark, or line on glass. On looking through the eyepieces the marks in question will appear as a single mark floating in space, and by vertical and horizontal adjustments this mark can be made to touch any given object in the picture. We have, thus, a means of measuring small parallaxes and vertical angles, and these can be read off graduated micrometer heads.

A stereo-comparator as above described gives angles from the centre of the plate, distances and vertical angles; but the reading is laborious and the map has to be constructed point by point.

In 1907 Lieut. von Orel, of the Military Geographical Institute of Vienna, attempted the construction of a machine which should quasi-automatically draw the map, and in 1909 such an instrument was made by Zeiss of Jena. A further model of 1911 permitted the automatic drawing of contours and the outline of detail. The instrument is called the stereo-autograph; several have been made and are in existence in Austria, Germany and France. A stereo-autograph is, of course, an expensive instrument and requires a skilled operator and good plates of even density. But, given these conditions, practical results have been obtained and the method is one to be reckoned with in the future. Generally with stereo-photography we are not limited to a country with marked features, as is the case with normal photo-topography. Provided that the view is clear, gently undulating or flat country can be as well surveyed and contoured as a mountainous region. The method has some obvious applications, but it is useless in forest-clad country or in towns and its value largely depends upon good view points. The old, photographic surveying has as its chief field of usefulness a well-marked mountainous region. The new is not so limited but its rôle has not yet been fully determined.

Bibliography of Photographic Surveying.—In 1895 Mr. E. Deville was able to quote the titles of 26 works on photographic surveying; in 1911 Dr. Pulfrich in his *Stereoskopisches Sehen und Messen* mentions 276 works, chiefly in German, on stereo-photography alone! The following books may be recommended: *Photographic Surveying*, E. Deville, Ottawa, 1895; *Hints to Travellers*, vol. I. R.G.S., 1906; *The Use of the Panoramic Camera in Topographic Surveying*, James W. Bagley, Washington, 1917; *Revue Générale des Sciences*, March 1914, Paris, for stereo-photo-topography.

Longitude by Wireless Telegraphy

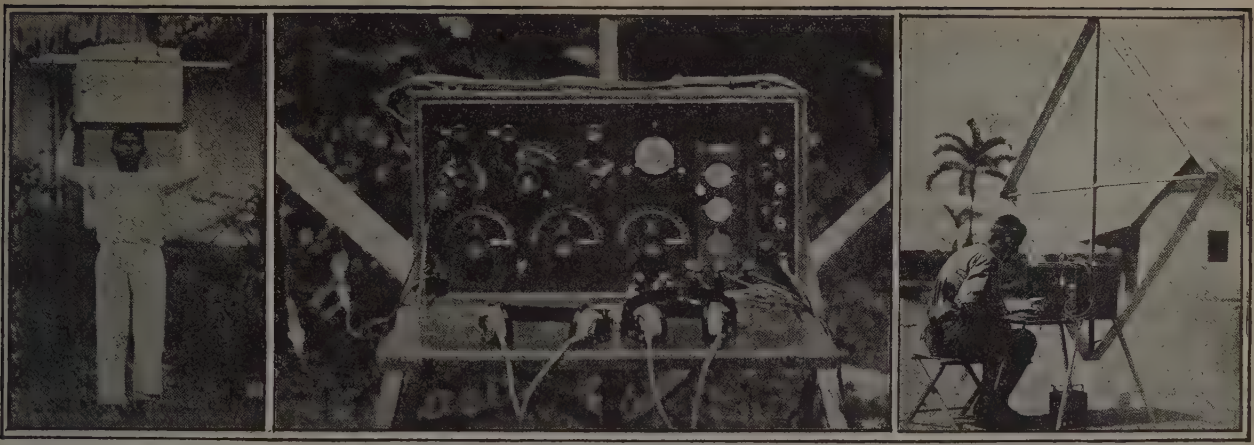
The chief technical difficulty which explorers and surveyors in new countries have hitherto experienced has been in the determination of longitude in regions unprovided with a telegraph system. This applies to almost all the unexplored, or little explored, parts of the world. Since 1910, however, the great advance made in the transmission of signals by wireless telegraphy has completely done away with this source of difficulty and error. Wireless "receiving" sets are now made of a very portable character; so much so, that one mule or one porter can carry the whole apparatus. Frequent practical use is being made of this method of obtaining time signals, as the following instances will show. In the year 1912 Comm. Edwards fixed positions during the Bolivia–Brazil boundary commission by wireless signals from Washington and intermediate stations; in 1913–4 Cav. Dr. Filippo de Filippi in an expedition to the Karakoram used wireless signals from Lahore and from Italy; Major A. J. Woodroffe in 1913–5 determined longitudes on the Peru–Brazil boundary commission by wireless signals sent from Senna Madureira, Brazil; in 1914–7 the French explorer, Lt.-Col. J. Tilho, used wireless signals from Paris to determine longitudes in his explorations of Tibesti, Borku, Erdi, and Ennedi; in 1917 Capt. A. J. Bamford determined the longitudes of Bagdad and Kermanshah by wireless signals from Fao, which had previously been connected with Basra; in 1919–20 the American traveller, Dr. A. Hamilton Rice, made use of wireless signals from Annapolis, Washington and Darien, to determine longitudes during his Amazonas expedition. Fig. 6 illustrates the wireless receiving set used by Dr. Hamilton Rice in 1919–20; it was designed by Mr. J. W. Swanson and Mr. P. F. Godley, and was found quite satisfactory and very portable.

It is safe to say that, in future, no properly equipped exploring expedition will be without its wireless receiving set. The designs of these sets will change from time to time and, no doubt, improvements will be made; but the method has proven to be thoroughly practical, and the extra amount of transport required is already of a negligible character. One of the greatest difficulties of the explorer has thus been removed.

Levelling

Since 1910 much progress has been made in the development of a sound system of levelling, especially with regard to precise, or geodetic levelling, *i.e.* that levelling which provides the framework on which all national levels depend. The now defunct International Geodetic Assn. laid down some wise rules on the subject of the precision of work of the highest standard. The admirable treatise of M. Ch. Lallemand, *Nivellement de haute Précision*, marked a great advance on previous text-books; and the production of the modern geodetic levelling instruments of France, the U.S. and Switzerland afforded the means of greatly increasing the accuracy of observation. To this should be added the introduction, by the Ordnance Survey of the United Kingdom, of a specially devised kind of permanent bench-mark, which did away with a weak element in the old levelling, the instability of the ground marks.

Levelling Instruments.—As a type of the instruments in use for levelling of high precision the level designed by Dr. Wildt, and made



Set packed for transport. Receiver and Loop set up ready for use. Receiving Signals.

Fig. 6.—Portable Receiving Set.

by the Carl Zeiss optical works of Jena, may be taken. Levels of this kind are also manufactured by Messrs. T. Cooke & Sons of York and Messrs. E. R. Watts & Son of London. The instrument includes the following modern improvements which distinguish it from the levels used for rougher surveys or engineering work; the bubble is read from the eye end of the telescope, so that it is not necessary to disturb the instrument by walking to its side and bending over to read it; the final levelling of the instrument is effected by means of a slow-motion screw which slightly tilts the telescope; and the level is provided with a micrometer attachment in the form of a plate of glass with parallel faces in front of the object glass and this attachment can be tilted by means of a screw, the amount of the tilt being read on a graduated drum. The use of this micrometer attachment enables readings to be made by the intersection of graduations on the staff, instead of by estimation. It is essential in using this attachment that the sights should be of equal length. Various patterns of staves have been used by different survey departments. The Ordnance Survey, for the new geodetic levelling of England and Wales, used staves manufactured by the Cambridge Mathematical Instrument Company. These staves are 10 ft. long and the graduations are marked on a strip of invar (an alloy of steel and nickel which has a very low factor of expansion); fixed to each staff is a circular level, for the staff-holder to keep it vertical.

Ground Marks.—The ground marks to which the observations are taken in the field are of various kinds and are known in British surveying as bench marks. The bench marks in use on the Ordnance Survey are: first class or fundamental; second class, which consist of flush brackets made of bronze let into a wall or other vertical surface, and fixed with cement; rivets, let into horizontal surfaces, such as pavements; and, third class, bench marks cut with a chisel in brick or stone walls, of broad-arrow shape.

The fundamental bench marks are new. It is well known that bench marks of the ordinary type are in general unstable; walls or houses are pulled down, or are subject to settlement, bench marks on isolated stones have been known to be moved and set up in new positions, marks on pavements or kerbs are shifted. None of the old types of bench marks is satisfactory as constituting permanent records of height and position. Moreover, in certain localities, such as mining areas and clay hillsides, the ground itself is unstable. It was therefore decided in planning the geodetic levelling of England and Wales that fundamental bench marks would be devised which should be of a very stable nature. These are established at intervals of about 25 m. from each other; the sites are carefully chosen and no bench mark of this kind is placed on loose soil or rock liable to local disturbance. In constructing such a mark a pit is dug through the soil, sub-soil and loose rock, until sound rock, or hard chalk, is found. The bottom and sides of the pit are lined with concrete, and two reference marks are placed in the bottom concrete, one of bronze and one of polished flint; these are covered with removable caps of metal. When the observations have been finished the pit is filled with sand or other suitable dry material. The internal marks described are those which are used for departmental purposes; but, for the public, an external mark is also provided. It is hoped that these marks will last for many hundreds of years and will, in the future, afford valuable information with regard to vertical movements of the crust of the earth.

Method of Observation.—The system of carrying out the observations in the field is based on the following principles. In order to minimize the effect of systematic error the levelling of any line is carried out once in each direction; the interval of time between successive levellings should be as short as possible; to minimize the effect of inclination of the line of sight the distances from the instrument to the fore and back staves should be as nearly equal as possible; to enable the graduations on the staves to be read easily the length of a space between the two staves is not in precise work to exceed 100 yds.; to reduce the effect of refraction, no reading is allowed even with the lower stadia hairs nearer than 6 in. from the lower end of a staff; observations are not allowed in bad or windy weather; the level is to be shielded from the direct rays of the sun.

It is on the observance of these and other common sense rules that the accuracy of the work will largely depend, and great attention must be paid to details, such as keeping the staves truly vertical or not letting the staff fall heavily on the picket or bench mark.

Errors.—The errors to which levelling is subject may be divided into those due to the staff, those due to the level, those due to the staff-holder, those due to the observer, and those due to the state of the ground, atmospheric conditions and unknown causes. The system of observation above described is directed towards eliminating, as far as possible, all errors not purely personal. Ultimately, when everything is done to evolve a sound system, it is the human element which tells most in the result, and the observer should possess excellent eyesight, a good stock of patience and be scrupulously honest; for in this, as in all scientific measurement, there must not be the least bias or wish to obtain a particular result. If the errors were all accidental and subject to the ordinary law, the probable error should increase as the square root of the distance levelled. There is, however, in levelling, a factor known as the "systematic error," by which the far end of a line constantly tends to appear the lower. If this systematic error were quite uniform, then double levelling would completely eliminate it; but this is not quite the case, and in the result, we are left with errors mainly accidental, plus an unknown amount of error not strictly subject to the law of accidental errors. A careful investigation by the Ordnance Survey has shown that the safest course, and that most in accordance with the conditions of the case, is to treat the whole error as accidental and as accumulating in proportion to the square root of the length of the line levelled. This is contrary to French practice. The probable error of 1 m. of double levelling is usually calculated from the formula $e = 0{\cdot}67\ (\Sigma d^2/4M)$, where Σd^2 is the sum of the squares of the discrepancies between the forward and back levelling from mark to mark, and M the length of the line in miles. The value of the probable error so obtained will usually be less than that obtained from a consideration of the closing errors. In recent Ordnance Survey precise levelling the value of e, from the above formula, is found to be somewhat less than ·003 ft., whereas the value found from a discussion of the actual errors of closure of the level net-work is ·0077. The probable error accumulated in the net-work between Newlyn in Cornwall and Dunbar in Haddingtonshire, two places separated by about 700 m. of levelling, is 0·16 ft., or about 2 in. This figure will serve to give an idea of the accuracy of modern precise levelling.

NAUTICAL SURVEYING

Although the World War restricted hydrographic surveying work, it led to improvements in methods and in instruments.

So far as the British Naval Surveying Service was concerned, it had generally been considered before that a marine survey need not be carried out with the degree of accuracy which is rightly considered necessary in purely land surveys: it being contended that so long as a marine survey was graphically correct very little attention need be paid to topographical details. Before the war the delineation of topographical details was but a secondary consideration in a hydrographical survey, and it was limited to the accurate fixing of objects conspicuous from seaward; contouring, except in large harbour plans, was generally sketched in by form lines. The experiences in the World War showed that in localities of possible strategic value accurate topography is of great importance. Where no land surveys are in existence or contemplated, the delineation of the land features must be included in the hydrographical survey. The lack of information due to the neglect of this important subject was much felt during certain operations of the war, particularly as affecting long range naval bombardments. The necessity for this accurate work on the part of the hydrographic surveyor has resulted in the adoption of new methods and of new instruments and the more general use of the land surveyor's instruments, all of which undoubtedly tends towards the more accurate charting of the seas. The elaborate methods and rigid accuracy of a triangulation on shore have been recognized by marine surveyors, although the refinement necessary for so-called first-class triangulation work does not often present itself.

Instruments.—Theodolites in current use (1921) are 4 in., 5 in. and 6 inch. The majority of these, formerly graduated to one minute, read to 20 sec. by Vernier, and micrometer theodolites read to 10 seconds. The use of the theodolite for astronomical and tacheometer work largely increased. Sextants for observing, with stand and artificial horizon, continue in use, but improvements in the sextant such as an endless tangent screw and electric light for night work have been adopted. More portable folding stands with slow-motion screws for movement of the sextant in azimuth and altitude are also supplied, and in addition amalgamated troughs, consisting of gold-covered plates on which a thin film of mercury is floated, have superseded the old artificial horizon consisting of a mercury bath; the new pattern is far less sensitive to earth tremors caused by surf, traffic, etc.

The Astrolabe à Prisme, a very precise instrument for finding position, enables altitudes of any stars at the exact altitude of 60° to be observed (see John Ball and H. Knox Shaw, *A Handbook of the Prismatic Astrolabe*, published by the Egyptian Government, Cairo Government Press, 1919).

Measuring chains have been almost entirely superseded by 100-ft. and 500-ft. steel measuring tapes, which are supplied with standardization certificates. The "10-ft. pole" has been supplemented by a "20-ft. pole" operated by two men and consisting of two boards connected by a wire 20 ft. in length and used in conjunction with a sextant. This method of measuring distance is, however, being gradually superseded by the use of tacheometers and tacheometer staves marked according to the Admiralty pattern, with which distances up to over 2,000 ft. can be very accurately measured.

One-metre base range-finders are useful in measuring short bases for plans of harbours, etc., when time or circumstances do not permit of a more accurate method.

Of the various forms of heliostat the Galton sun signal has proved a most excellent instrument, and fitted to theodolites it allows of the sun's rays being expeditiously and accurately directed to, and kept on, the station desired, whether the latter is visible or not.

Ship sounding has been greatly improved by the introduction of the Douglas Schäfer sounding gear, which enables ship sounding to be carried out under way in any depth up to about 40 fathoms with great speed; other methods of sounding such as the "Somerville" gear have also been adopted, and, in addition, far greater attention has been paid to sweeping for rocks, shoals, etc., the method used for mine-sweeping having been adapted to this purpose.

Other entirely different methods of sounding were also due to experience gained during the war. The most popular method under trial in 1921 was "Acoustic Depth Sounding" which depends on the principle of the acoustic echo, the depth being measured by the time taken for the shock of an explosion or other impulse produced in a ship to reach the bottom and be reflected back as an echo to a receiver on board the ship. By this device it was hoped to obtain either a single indication of the exact depth at any moment or a continuous indication of the depth registered automatically at any selected position. The importance of this method of sounding from a ship under way at any speed, without the necessity of casting the lead, needs no insisting upon.

Taut wire measuring gear was in 1921 fitted or being fitted to all British surveying ships. This method of measuring distances at sea in comparatively shallow depths had proved most successful and was adopted after having been extensively used in connexion with mine-laying during the war. The ship preserves a steady course and at a constant speed over the distance to be measured and at the same time runs out a thin piano wire from a drum which carries many miles of the wire. It is laid taut by means of a special brake device, the amount of wire out being registered on a dial. A correction (always subtractive) must be made for errors. This varies from 1,000 to 3,000 ft. in a distance of 100 m., and is governed by the contours of the sea bed upon which the wire has been laid. The dial registers 1,000 rev. for a mile of 6,080 ft., consequently when plotting in sea miles a second correction, for latitude, is necessary. This method of determining distance is specially useful when surveying out of sight of land, and is used in combination with astronomical observations and moored beacons.

Fixing Positions of Ships, Buoys, etc., by Subaqueous Sound-ranging.—This new method of accurately fixing the positions of buoys, etc., is carried out by dropping an explosive charge at the position it is required to fix. The sound of the explosion travels through the water to a number of hydrophones suitably placed, and the positions of which are accurately known. The differences between the times at which the shock reaches the various hydrophones are recorded photographically by a galvanometer on shore, to which the instruments are connected by cables. From these observations it is possible to calculate a position line for each pair of hydrophones. Three or four such lines from hydrophones suitably placed will give a cut, which is the position of the explosion.

As in all surveying problems, the accurate fixing of a point from two others depends on the length of the base, that is, the distance between two known points, so does the accurate fixing by sound through the water depend on the hydrophones, or groups of hydrophones being such a distance apart, commensurate with the distance at which it is required to fix the buoy, etc.

Chronometers.—Surveying ships are now supplied with from 8 to 12 chronometers of the box type, with pocket chronometers for use outside the chronometer room. The chronometers supplied are selected instruments which have successfully passed most exhaustive tests at the Royal Observatory, Greenwich. For astronomical work on shore, the portable Lindqvist chronograph is employed. In this instrument, a chronometer fitted with special contact pieces automatically sends an electric current every two seconds through an electro-magnetic coil, and thus, by suitable mechanism records every alternate second as a perforation on a paper tape, which is kept moving at a uniform rate by means of clockwork. The closing of a switch by the observer operates a second coil, which records the instant of observation in a similar manner by making an additional perforation in the tape.

Wireless Telegraphy for accurate time and obtaining meridian distances has been adopted, and in this connexion the wireless Vernier time signals made by Eiffel Tower may be mentioned.

Amongst minor improvements introduced in surveying appliances since 1910 may be mentioned the standardization of the markings of leadlines, improved buoys for beacon work, light filters for fitting to the eyepieces of sextant and theodolite telescopes.

By 1921, platinised and stainless steel mirrors for sextants and sun signals were under trial; electrical lighting arrangements to sextants and theodolites; eye shields for use in observing to assist in perfect orientation of the head; sextant supports to facilitate observations at sea; the arcless sextant which enables angles to be taken and read off (on a drum) without the necessity of removing the eye from the telescope; wireless telegraphy outfits for use of detached parties, and the gyro compass, were all in various stages of experimental development. The Pillsbury current meter was entirely superseded by the Ekman current meter, and other meters such as the Daisy and Gurley were in use.

In calculating triangulations considerable time is saved in correcting for false station by use of the station corrector diagram, by which the correction can be obtained very quickly to any accuracy required (generally about 5 sec. of arc) and the tedious trigonometrical calculation avoided. The slide rule has come far more into prominence for small rough calculations. As the result of modern inventions, it has been found necessary in recent years to produce special charts for the use of submarines and for other purposes in addition to the ordinary navigational chart. Charts for submarines indicate graphically the nature of the sea bottom, so as to indicate where vessels can rest with safety.

The introduction of wireless direction-finding stations as an aid to navigation has necessitated the production of charts drawn on the gnomonic projection, by the use of which positions can be more accurately determined. Additional charts are also required for testing range-finders and compass adjusting. Physical charts indicate the direction of prevailing winds and ocean surface currents at different periods of the year, localities and time where ice may be fallen in with, and the direction and force of the stream and drift currents of the oceans.

Considerable gain in accuracy has been obtained by printing charts directly on backed paper, whereby the distortion incidental to the old system of subsequently mounting them is largely eliminated. (H. P. D.)

SUTTNER, BERTHA, Baroness von (1843–1914), Austrian writer (*see* 26.171), who in 1911 became a member of the advisory council of the Carnegie Peace Foundation, died at Vienna June 21 1914.

See H. v. der Mandere, *Bertha Suttner* (1909).

SUTTON, SIR HENRY (1845–1920), English judge, was born Jan. 10 1845. He was educated at Rugby and Christ's College, Cambridge, where he graduated in 1868. He was called to the bar in 1870, in 1890 was made junior counsel to the Treasury, and in 1905 was raised to the King's Bench division, being knighted in 1906. He retired in 1910, and died in London May 30 1920.

SVENDSEN, JOHANN SEVERIN (1840–1911), Norwegian composer (*see* 26.175), died at Copenhagen June 14 1911.

SWAN, SIR JOSEPH WILSON (1828–1914), English physicist (*see* 26.179), died at Warlingham, Surrey, May 28 1914.

SWAYTHLING, SAMUEL MONTAGU, 1ST BARON (1832–1911), British financier, was born at Liverpool Dec. 21 1832, and came of a Jewish family named Samuel, but afterwards took by royal licence the name of Montagu. Beginning in early life in a very humble way of business he gradually acquired great wealth by enlarging its scope, and he rose to the head of the most important arbitrage house in London. A strong Liberal in politics, he sat in Parliament for the Tower Hamlets from 1885 to 1900; he was a member of the Gold and Silver commission of 1887–90, being himself a bimetallist. He was created a baronet in 1894, and raised to the peerage in 1907. Throughout his life he was a zealous promoter of Jewish interests, founding the loan fund of the Jewish board of guardians, the Jewish working men's club and several synagogues, and for his work on emigration schemes for the persecuted Russian Jews he made many journeys in Europe and America, succeeding Sir Julian Goldsmid as chairman of the Russo-Jewish Committee. He also helped to establish a modern secular school for Jews at Jerusalem in 1875. He died in London Jan. 12 1911, being succeeded in the title by his eldest son, Louis Samuel Montagu (b. 1869). His second son, Edwin Samuel Montagu (b. 1879), entered politics, and, after having been Under-secretary for India (1910–4), Chancellor of the Duchy of Lancaster (1915), Financial Secretary to the Treasury (1914–6) and Minister of Munitions (1916), was made Secretary of State for India in 1917. His fourth daughter, Lilian Helen (b. 1873), became a well-known social worker and was appointed J.P. for the County of London in July 1920.

SWEDEN (*see* 26.188).—The Swedish census of 1910 showed an increase since 1900 of 7·5%, from 5,136,441 to 5,522,403 inhabitants. The pop. on Jan. 1 1920 was 5,847,037 (2,868,395 males and 2,978,642 females), of whom 1,701,249 were living in cities, distributed as follows: Norrland (northern division) 1,018,009, Svealand (central division) 1,879,146 and Götaland (southern division) 2,949,882. The density of pop. is rather low; in Götaland 34, Svealand 23 and Norrland only 4 inhabitants per square kilometer. The chief towns with a pop. exceeding 20,000 inhabitants (Jan. 1 1920) were Stockholm (415,201), Gothenburg (200,577), Malmö (111,931), Norrköping (57,377), Helsingborg (45,805), Gävle (36,092), Örebro (35,096), Eskilstuna (30,103), Västerås (29,530), Jönköping (28,875), Upsala (28,041), Karlskrona (27,029), Linköping (26,300), Borås (23,941) and Lund (22,827).

The excess of births over deaths is low: 10·6 per 1,000 in 1910, 6·9 in 1915 and 5·2 in 1919. The birth-rate for 1919 was 19·6 per 1,000. There were 24,704 emigrants in 1906, 27,816 in 1910, 7,512 in 1915, 10,571 in 1916, 6,440 in 1917, 4,853 in 1918, 7,337 in 1919. During the war emigration was naturally difficult. The immigration figures were: 6,357 in 1915, 6,713 in 1916, 5,811 in 1917, 4,932 in 1918, 7,809 in 1919. The United States received the largest contingent of the emigrants, but Norway, Denmark and Canada also received considerable numbers. Swedes resident abroad number between 2,120,000 and 2,245,000, of whom 1,500,000 are in America and 370,000 in Finland.

Occupations.—Agriculture, fishing and forestry provided 48·4% of the pop. with their livelihood in 1910; in 1900 the percentage had been 54·4, and in 1890 61·51, the decline having been progressive since 1840, when the percentage was 80·9.

Those dependent on employment in industry, mining, trade and communications represented 45·8% of the pop. in 1910, as against 38·8% in 1900, 31% in 1890 and 10·7% in 1840. Those following the so-called "free crafts" (*fria yrken*) or engaged in the public service (*allmän tjänst*) represented 5·8% in 1910 (6·8% in 1900, 7·5% in 1890 and 8·4% in 1840). The most significant feature in this development is the increased importance of the industrial section. The census figures for 1920 in this respect were not available in 1921, but this section now represents half the population.

Agriculture.—Cultivated soil included 3,723,000 hectares in 1915, 1,715,000 hectares being used for grain, 1,411,000 for fodder stuffs, 26,100 for root crops, 3,000 for other crops, and 333,000 being left fallow. Gardens in 1915 occupied 47,533 hectares. The total value of the harvests in 1914 was estimated at 1,112,000,000 kr. and in 1920 at 2,012,000,000 kronor. The annual consumption of wheat increased from 47·7 kgm. per person in 1891 to 87·8 in 1915. The consumption of rye diminished from 110·6 in 1891 to 98·1 in 1915. The country's own production of corn has not been sufficient, and large supplies have been imported. During the decade previous to the war about 50% of the wheat was imported, and from 10% to 15% of the rye. The ease with which corn could be imported militated against all attempts to make the country self-supporting in this respect, and efforts came to be concentrated on stock-raising. The number of horses in 1916 was 701,099, of cattle 2,913,159, and of pigs 1,065,396. It was the agricultural policy of the country before the war to import a considerable amount of the corn required and large supplies of maize, oilcakes and other fodder stuffs, and in their place to export live stock, butter and cheese. The balance was not in Sweden's favour if seen merely from an agricultural standpoint. In 1913 there was an exportation surplus for live stock of 16,500,000 kr. and for butter and cheese of 46,700,000 kr., but there was an importation surplus for other animal products of 25,400,000 kr.; for grain, potatoes and seed corn of 58,600,000 kr.; for fodder stuffs of 22,800,000 kr. and for manure of 14,800,000 kr. The balance showed an importation surplus of 58,300,000 kr. Some decades earlier the country was as good as self-supporting, but the great industrial population has come into being since then and conditions of life have been radically changed thereby.

A more intense cultivation of the soil has been carried out with great energy. The splitting up of the land for the most part into small holdings has been a disadvantage to a certain extent. The large farms lead the way, and in localities where modern methods of agriculture sufficiently prevail the small farmers join together in coöperative societies. The scientific study of plant-growing and of manures is carried on in different parts of the country under the guidance of a central institute in Stockholm. Seeds have been greatly improved under the influences of the seed society in Svalöv (in Skåne), which also exports seeds. The Swedish moss cultivation society, which has its headquarters in Jönköping, has taken the lead in the systematic cultivation of the country's wealth in bogland.

Fishing contributes considerably towards the support of the population. The value of a year's catch may be estimated at between 20,000,000 and 30,000,000 kronor. Export of fish provides a balance of gain to the country of some millions of kronor a year. During the years of the World War measures were taken to promote the consumption of fish in Sweden itself.

Forestry.—Out of Sweden's total land area, which amounts to 41,000,000 hectares, 21,400,000, or nearly 52%, constitute forest-bearing land, whereof about 4,900,000 hectares, or 23·1%, are public property. In 1913 the output of sawed or planed timber was estimated at 7,800,000 cub. metres, mechanical wood pulp 326,000 tons, chemical wood pulp 860,000 tons, charcoal 4,300,000 cub. metres, and other products 18,500,000 cub. metres. In the same year the exports of plain sawn and planed wood were valued at 186,900,000 kr., of partly worked wood at 28,600,000 kr., and of wood-pulp at 99,700,000 kr., or 315,200,000 kr. altogether. These exports amounted to 38·6% of the total exports of the country. In certain years the exports of the products of the forests have amounted in value to half the total exports of Sweden. The economic world crisis after the war naturally caused a great diminution in export.

Industry.—Sweden is also rich in iron ore, and her water-falls make her well equipped for industrial enterprises. But coal is to be found in only one province, Skåne, and she is obliged to import large supplies of both coal and coke. The great distances for transport, moreover, entail heavy freight costs. Workmen enjoy a correspondingly high standard of living.

In 1915 the products of manufactories and mines had a value of something over 3,000,000,000 kronor. The extent to which Swedish industries had developed may be seen from the fact that the amount of horse-power in machinery per 1,000 workers had increased to 3,532 in 1915, from 2,841 in 1911 and 1,980 in 1906. The most important wood-sawing industries are found on the coast of Norrland, notably around Sundsvall and Hernösand. The timber is floated down the big rivers from the forests. Paper pulp is one of Sweden's most important exports. Paper is another. The exports of mechanical wood-pulp (dry weight) in 1915 amounted to 150,103 tons, of which 80,783 went to Great Britain. In the same year Sweden exported 721,786 tons (dry weight) of chemical paper-pulp, of which 298,056 went to Great Britain. The iron industry is to be found within a broad belt of land nearly level with Stockholm and a little farther to the north. The use of charcoal has helped to make practicable the manufacture of Swedish high-quality steel. In 1915 there were 135 iron-works (with 28,868 workmen), of which 78 had in all 120 furnaces in use, producing 748,928 tons of pig-iron and 11,773 tons of castings. The exports of iron and steel in 1915 had a value of 97,600,000 kr., as compared with imports of 27,800,000 kronor. Foundries and mechanical engineering works in 1915 had an output of 339,600,000 kr.; exports were valued at 115,600,000 kr., as compared with imports of 41,400,000 kronor.

During the war some industries throve exceedingly, as, for instance, those of iron, paper-pulp and paper; others suffered appreciably at times from the lack of raw materials, as, for instance, the textile industry. During the second half of 1920 and in 1921 industry was hit hard by the economic crisis.

Commerce.—Sweden's foreign trade in 1910–20 presented a curious picture, inasmuch as the value of her exports during the war period exceeded that of her imports. In 1910 her imports amounted to 669,200,000 kr. and her exports to 592,900,000; the corresponding figures for 1914 were 726,900,000 and 772,400,000. The figures for the subsequent war years were as follow: 1915, imports 1,142,500,000 kr. and exports 1,316,400,000 kr.; 1916, imports 1,138,600,000 kr. and exports 1,556,400,000 kr.; 1917, imports 758,600,000 kr. and exports 1,349,600,000 kr.; 1918, imports 1,233,300,000 kr. and exports 1,350,400,000 kr. After the war the picture changes. In 1919 the figures were: imports 2,534,000,000 kr. and exports 1,575,700,000 kr.; in 1920 imports 3,373,500,000 kr. and exports 2,293,600,000 kr. It will be noted how goods were regularly drawn out of the country during the war, while the imports were inadequate. The circumstance that home-grown wood was to a great extent used instead of imported coal also counted. When the war came to an end the country lacked reserve stocks and needed many articles of consumption. Importation increased, in part on speculative lines, from Germany and Russia, and with results which for the most part were unfortunate.

It may be interesting to give figures illustrating Sweden's commercial relations with the leading belligerent Powers. In 1913 imports into Sweden amounted to 846,500,000 kr.; exports from Sweden to 817,300,000. Her imports from Great Britain amounted to 206,800,000 kr. and those from Germany to 289,900,000 kr.; her exports to Great Britain amounted to 237,300,000 kr. and those to Germany to 179,100,000. Her transactions with Germany were somewhat in excess of those with Great Britain, but the latter country came first as purchaser of Swedish products. During the war a great reduction came. Imports into Sweden from Great Britain amounted to 183,800,000 kr. in 1914; 213,500,000 kr. in 1915; 164,400,000 kr. in 1916; 65,100,000 kr. in 1917; 148,700,000 kr. in 1918 and 668,900,000 kr. in 1919. Imports from Germany came to 238,600,000 kr. in 1914; 251,500,000 kr. in 1915; 420,200,000 kr. in 1916; 288,200,000 kr. in 1917; 447,900,000 kr. in 1918 and 269,100,000 kr. in 1919.

Exports to Great Britain amounted to 258,300,000 kr. in 1914; 329,600,000 kr. in 1915; 320,100,000 kr. in 1916; 216,100,000 kr. in 1917; 252,600,000 kr. in 1918; 509,900,000 kr. in 1919. Exports to Germany came to 174,800,000 kr. in 1914; 486,400,000 kr. in 1915; 437,500,000 kr. in 1916; 352,100,000 kr. in 1917; 292,800,000 kr. in 1918 and 130,800,000 kr. in 1919. During the war years British coal imports into Sweden declined, and Germany largely made good the deficiency, being naturally anxious to secure imports from Sweden. The figures for the Swedish importation of coal and coke, in thousands of tons, during the years 1913–7 were: from England, 4,916; 4,683; 2,816; 1,707 and 604; and from Germany, 431; 335; 2,174; 4,281 and 1,708. It will be seen how energetically Germany came forward in Great Britain's place as exporter to Sweden.

Shipping.—The Swedish commercial fleet in 1910 included 1,214 steamers and motor-boats, of 842,460 total tonnage deadweight; in 1915 1,278 vessels, of 984,799 tonnage; in 1918 1,238 vessels, of 894,260 tonnage. The figures for sailing vessels were in 1910 1,635, of 204,624 tonnage; in 1915 1,422, of 161,650; and in 1918 1,295, of 141,396. The diminution was due partly to war-losses.

Communications.—The Swedish railway system had in 1910 a length of 13,829 km., and in 1919 of 15,154, whereof 4,418 and 5,496 respectively were State railways. Through the thinly populated inner region of Norrland there runs a State railway line which has been opened for traffic between Östersund and Vilhelmina. A single-line railway along the coast of Norrland has been planned out and begun with aid from the State. During the war the railways were sometimes quite overloaded, so that locomotives could not be repaired to the extent they needed, and lubricants and good coal ran short. The increased costs drove up passenger and goods rates.

During 1909–16 the Trollhätte canal was reconstructed and deepened to four metres. The Sodertalje canal was in 1921 in process of reconstruction and of deepening to five metres. Through the former operation navigation was made possible to the great Lake Venner and thus between Gothenburg (Göteborg) and the Western mining district, and through the latter a good waterway was being created to the harbour of Lake Mälar.

Social Conditions.—Democracy has a strong hold on the Swedish people, owing to the high degree of education reached by the masses and to their inherited respect for the sanctity of law. Familiarized from an early date with self-government, Sweden had begun already in the closing decades of the 19th century to build up a kind of network of nonconformist religious associations, Anglo-Saxon in their character, temperance unions and friendly societies. When, as the outcome of advances in industrialism, the labour movement began to take shape, it was able to utilize these habits of organization and thus secure a position of considerable power comparatively quickly. Now more than 60% of Sweden's wage-earners belong to trade unions; at the beginning of 1921 these had over 400,000 members, of whom 280,000 combined to constitute the so-called "Lands Organisationen," which may be translated as "The National Organization," while simultaneously the political side of the labour movement, Social Democracy, became a force of the first order. Swedish Social Democracy has relied more and more on parliamentary methods of reform, thereby awakening opposition on the part of the labour extremists, with the result that in 1917 a new Socialist party of the left came into existence, formed for the most part of young men, a large number of whom were strongly influenced by Russian Bolshevism. In the spring of 1921 these latter formed a Communistic party connected with the Third International in Moscow. The bulk of Swedish workmen, however, hold aloof from revolutionary tendencies, thanks to the great extension which has been attained by coöperation. While workmen constitute a typical class party, another class party formed by the association of farmers and countryfolk, under the title of the "Böndeförbund," dated its origin from 1917.

In 1913 a law was passed instituting compulsory old-age and disablement insurance for the entire population. In 1916 a similar accident insurance law was passed. The law passed in 1919 for an eight-hour day was the most advanced of any in Europe. The national administration includes a special social department, as well as a number of boards for dealing with social questions.

The communes also, especially the large towns, have instituted important social reforms; for instance, by creating public labour exchanges, which have been State-endowed since 1907 and are under State guidance and control. In common with the State, moreover, the communes contributed to the general pensions insurance. The guardianship of the poor used to rest on the primary communes, but, through a new Poor Law, passed in 1918, this burden is now in certain cases transferred to the provincial assemblies (Landsting) and the State.

The first decade of the 20th century was marked by the creation and swift growth of employers' associations (notably that known by the name "Svenska Arbetsgivare Föreningen," whose members in 1920 employed nearly 300,000 workmen) and also of associations of landowners; and in several great conflicts, as, for instance, in a five-weeks' general strike in the summer of 1909, in which 300,000 workmen took part, the victory fell to the employers. For a long time the State's only action in the matter remained the passing of a law in 1906 for the intervention of a Conciliation Court in labour disputes. By reason of the high standing, however, of the trade-union organizations, and as the result of frequent collective agreements on both sides, certain conventional methods of treaty came into vogue in the field of labour disputes. In 1920 the Riksdag passed a law instituting a central State conciliation and arbitration court, as well as local courts of the same kind, to pronounce judgment in labour disputes on the basis of their collective agreements.

The Liquor Question.—For close on a century past the alcohol question in Sweden has been a subject for the most serious consideration and for constant measures of reform. The unhappy results of the excessive consumption of gin at the beginning of the 19th century called forth an energetic temperance movement, led by a clergyman named Peter Wieselgren (1800–1877), a "domprost," or dean, of the Lutheran Church; and in 1855 a law was passed which abolished the right to manufacture gin for home consumption and which granted concessions to companies, with no financial interest in the traffic, to sell alcoholic drinks under public control. This "Gothenburg System," as it was designated, brought about considerable improvements in many respects, and the great temperance societies, with a total membership of 450,000, have worked in the same direction. It was, however, only by the new law regarding the sale of liquor which was passed in 1917, and which came into force in 1919, that the underlying principle ("disinterested management") of the Gothenburg System was consistently put into general practice. By this law the selling to individuals of drinks containing more than 3·6% of alcohol was confined exclusively to the so-called "systembolag" ("system company"), with about 150 branches, over the management of which the State authorities have decisive control and which pays over all its profits to the State Treasury except for 5% interest on the capital invested. The controlling of this "system company" is entrusted to a central institution known as "Kontrollstyrelsen." All persons who wish to purchase such liquors for home consumption are registered and receive a pass-book; the total amount of liquor allowed to them being limited to a maximum of four litres a month. The abuse of alcohol is attended by further restrictions or by the absolute withdrawal of the right to purchase. The amount of liquor which may be sold to a customer in a restaurant is also strictly limited and confined to meal-times. This system of liquor-dealing, which was set on foot in Stockholm in 1913 and organized by Dr. Ivan Bratt (coming to be known as the Bratt system), was supplemented by a special measure regarding the treatment of alcoholists. The system had remarkable results, proportionate in large degree to the activity of the leading members of the various companies. The consumption of spirits decreased in many places, for instance in Stockholm, by nearly 50%. The number of cases of drunkenness, which was formerly somewhat high, was reduced throughout the country—in Stockholm and in certain other places by 60%—and so was the number of persons suffering from alcoholism. Much opposition from the side of those who regard the restrictions introduced as altogether excessive was brought to bear against the system; on the other hand, a tendency arose among the temperance associations to believe that total prohibition was the only way towards the solution of the alcohol problem. Smuggling and illegal manufacture of spirits developed to a disquieting degree in the years 1917–8. There were signs, however, in 1921 of a return to a better state of things.

Finance.—In 1910 the state budget amounted to 265,200,000 kr., in 1915 to 415,400,000, in 1920 to 929,400,000, and in 1921 to 1,131,100,000. For 1920 and 1921 the so-called "tilläggsstater," *i.e.* supplementary military budgets, are included. The tax revenue in 1921 amounted to 579,200,000 kronor. The consolidated national debt amounted at the end of 1920 to 1,280,600,000 kr.; in 1910 it had been 543,400,000 kronor.

Apart from the national bank, the Riksbank, which alone issues bank-notes, there were in 1910 17 private and 63 joint-stock banks, which in 1920 had decreased to 11 and 30 by amalgamations. Their total paid-up capital and reserve funds amounted in 1910 to 562,600,000 kr. and in 1920 to 1,084,000,000 kronor. At the end of 1920 the Riksbank balanced its revenue and expenditure at 1,017,500,000 kr. and the other banks' balance stood at 7,662,300,000 kronor. The leading private bank is Stockholme Enskilda Bank; the largest joint-stock banks are Skandinaviska Kreditaktiebolaget, Svenska Handelsbanken (formerly Stockholms Handelsbank) and Aktisbolaget Göteborgsbanken.

The circulation of paper money increased from 206,500,000 kr. in 1910 to 759,900,000 kr. in 1920. During the war years the Riksbank was relieved from its liability to meet notes with gold, and also to receive gold in ingots (*see* EXCHANGES, FOREIGN).

The Swedish savings banks in 1919 numbered 477; their deposits amounted to 1,870,800,000 kr. and their capital to 107,100,000 kronor. The post-office savings bank, a State institution, had deposits amounting to 84,400,000 kr. at the end of 1920.

Constitution.—The Swedish Parliament, the "Riksdag," consists of two elected Chambers, the First Chamber being composed of communal representatives. A constitutional change of a radical kind took place in 1907 and was confirmed by the Riksdag of 1909. The communal suffrage was on a scale proportionate to income, the graduation was now limited so that no person could have more than 40 votes, the bulk of the middle classes thus acquiring a preponderance. Absent voters could delegate their voting rights to others. Women had the communal suffrage in proportion to the degree in which they themselves were liable to taxation. Proportional representation was introduced in the case of both Chambers. Members of the First Chamber, in common with those of the Second, were paid. The suffrage in the case of the Second Chamber became universal and remained, as before, equal for all.

By Riksdag resolutions in 1918, 1919 and 1921 the constitution was further developed in a markedly democratic direction. Under these reforms the First Chamber consists of 150 members, elected by proportional representation by the provincial assemblies, *i.e.* either by "Landstingen" or by specially formed bodies of electors, chosen also by proportional representation by those possessing the communal suffrage. The communal suffrage is universal and equal; it is no longer graduated and it is personal. When it was graduated in proportion to income, business companies possessed the communal suffrage. Anyone who fails to pay his taxes for three successive years forfeits his right to vote. Women have the same voting rights as men. The age at which the voting right is acquired is 23, but the age is 27 for the right to vote for the members of the provincial assemblies which elect the First Chamber. The right to vote by proxy is abolished, but a husband may deliver a wife's vote in a closed envelope, or a wife a husband's. Similarly, in the case of both the communal elections and the elections to the Second Chamber, soldiers on active service, absent seamen and fishermen, and employees of railways, ports, customs and pilot services may send in their votes by post.

The number of the voters in the communes has been more than doubled. After the reform the communes' lists of voters contained nearly 3,300,000 names, *i.e.* more than 56% of the pop., and of these about 1,600,000 were men and 1,700,000 women. In March and April 1919 took place the new communal assembly elections: in two 'Landsting' out of 25, and in 20 towns out of 107 (among them Stockholm), the Social Democrats and Socialists of the Left together won absolute majorities. In ten 'Landsting' and 38 towns the Social Democrats were the strongest party. The election periods are eight years for the members of the First Chamber, one-eighth of whose number are elected each year; and four years for the Second Chamber's 230 members, who are all elected at one time. Women as well as men are eligible as members of both Chambers. The age at which a person becomes eligible for the First Chamber is 35, for the second 23. To be eligible for the First Chamber a person must have a certain specified income or property. If a member can no longer perform his duties, his place is taken by a substitute elected at the same time as himself. The Riksdag is called together every year on Jan. 10 for its ordinary meeting.

In 1921 the Riksdag passed an Act to provide that a consultative referendum shall be had recourse to when the Government and the Riksdag think it desirable to take the opinion of the people direct by plebiscite on some important question before its decision by the Riksdag. The proposal decided on must be submitted once again after a new Second Chamber election before it becomes binding. Another constitutional change was involved in the creation of a foreign affairs committee, which the Riksdag shall elect every year, and with which the Government shall take counsel regarding foreign affairs. The Riksdag's right to share in decisions regarding agreements with foreign countries has been extended. Yet another constitutional novelty is the right given to women to hold office under the State where no special hindrance lies in the way.

HISTORY.—On the death of King Oscar on Dec. 8 1907 he was succeeded by his eldest son Gustav V. Rear-Adml. Arvid Lindman had been at the head of the Government since May 1906, with Erik Trolle, former Swedish minister at Berlin, as Minister of Foreign Affairs; Carl Swartz, a manufacturer, as Minister of Finance; Maj.-Gen. Lars Tingsten as chief of the Department of National Defences, and Alfred Petersson i Påboda, a landowner, as Minister of Agriculture. In 1907 this Ministry had carried a measure of constitutional reform, embodying universal suffrage in regard to the Second Chamber and proportional representation in regard to both Chambers; and this measure, in accordance with statute, was confirmed by the Riksdag of 1909 after the election of members of the Second Chamber in the autumn of 1908. Owing to a divergence of opinion within the Ministry upon an important point bearing upon the extent of the Riksdag's powers, Trolle, Petersson and one other minister resigned in 1909. The new Foreign Minister was Count Arvid Taube, who had succeeded Trolle as representative of Sweden at Berlin. Some time afterwards Maj.-Gen. Tingsten also resigned. Moderate Conservatism was the note of this Ministry. The ministerialist party in the Riksdag had a majority in the First Chamber and a minority in the Second.

The National Defence Question.—At this period the problem of national defence was in the forefront of Swedish politics, inasmuch as the foreign affairs of the country were in a condition calculated to arouse anxiety. The union with Norway had been dissolved in 1905 and Sweden now stood alone in respect to foreign politics. Finland, which in 1809 had been taken from Sweden and united to Russia, had been having its autonomy more and more reduced, and Russia's foreign policy seemed to show a forward tendency westwards. A great variety of new military measures in Finland seemed to point to something more than a desire on the part of the Russian Government to prevent a German invasion of Southern Finland in the event of a Russo-German war. Right up to the north of the Gulf of Bothnia a network of railways was being spread out for military purposes, and new strategic lines were constructed of a kind necessitated neither for purposes of defence against Germany nor for purposes of trade. Barracks sprang up at the railway junctions. In Sweden Russian spies were ubiquitous, and a Russian military attaché had to be recalled on the ground of having pushed inquisitiveness beyond all limits. A handbook was produced for the use of the Russian military service containing information about the conditions of life in Sweden, and with Swedish maps in it, as well as a short vocabulary of military terms in Russian and Swedish. Swedes had an uncomfortable feeling that the attention of Russia was being directed altogether too closely upon their inadequately defended country.

A careful enquiry into the question of national defence had been undertaken in 1907. The Liberal members of the committee of investigation which was appointed were dissatisfied with its estimate of the defence expenditure required, and signified their attitude by withdrawing from it in 1910. This militated somewhat against the efforts of the committee, and it proved to be impossible, as had been intended, to submit a new scheme of national defences to the Riksdag of 1911. Instead of this, the Government brought forward a proposal for a new naval programme, and, in the face of opposition from the Liberals and Social Democrats, carried a bill, as a first step, for the construction of a powerful new battle cruiser.

Liberals in Office.—In Sept. 1911 the general election for the Second Chamber of the Riksdag, under the reformed methods which had almost doubled the electorate, resulted in increasing the strength of the parties of the Left. The Liberals elected numbered 101, the members of the Right numbering 65 and the Social Democrats 64. Admiral Lindman's Ministry resigned, and in Oct. the King entrusted Karl Staaff, who had been prime minister in 1905–6, with the task of forming a new Government. This Ministry remained in office until Feb. 1914. Count Albert Ehrensvard, previously Swedish minister at Washington, became Minister of Foreign Affairs, and both of the departments of national defence were placed under civilians, in accordance with the Liberal view that there should be greater civil control. Alfred Petersson, who had gone over to the Liberals, became once more Minister of Agriculture. The question of national defence again came up for treatment, but upon different lines and almost exclusively at the hands of the members of the Left. It had not been possible to proceed further with the projected new ironclad than the making out of the designs. The Government proposed to the Riksdag of 1912 that the project should be abandoned and the Riksdag agreed. This cancelling of a previous decision of the Riksdag, on account of the new elections having altered the composition of the Second Chamber, evoked strong dissatisfaction. Within a brief space of time a sum of 17,000,000 kr. was raised by voluntary subscription for the building of the ship, and since the Government was unable to decline to use this fund the keel was laid down on Dec. 1. The whole country was now stirred up, and further sums were subscribed in the same way to furnish machine-guns for the Landsturm and to provide aircraft. Towards the end of 1913 things had come to such a point that the prime minister was able in the course of a speech to advance arguments in favour of a forthcoming proposal for a winter training for the army, the establishment of reserve forces, the levying of a higher war-tax on the more well-to-do, the amelioration of the laws governing war, etc. But in view of the election promises to which the Liberal leaders had committed themselves during the contest of 1911 this programme was not to be submitted all at once; its most important item alone, that of the training of the infantry, would in the first place be submitted by itself on the occasion of the Second Chamber elections of 1914 before being proposed to the Riksdag. The public discussion of the matter became very lively, and although no thoroughgoing defence programme was in fact submitted to the Riksdag of 1914, violent feelings were aroused and expressed.

At last even the small farmers and peasantry, usually anything but enthusiasts for defence measures owing to the heavy personal taxation entailed, were drawn into the movement. On Feb. 6 1914 there was a great meeting in Stockholm of more than 30,000 representatives of this class from all parts of the country, assembled for the purpose of bringing home to King Gustav their anxiety at not seeing the question handled promptly and in its entirety. They were received by the King in the great courtyard of the Royal Palace, and their spokesman declared that the Swedish people were willing to bear the burden of whatever measures of defence were necessitated by the gravity of the time. The King answered that he, too, was of opinion that the problem called for treatment in its entirety and without delay.

This demonstration had important consequences at once. The Ministry had had no previous intimation of what the King was going to say, and matters were brought to a head by the resignation of Staaff and his colleagues. On Feb. 17 a new Ministry was formed, with Hjalmar Hammarskjiöld as its head.

Policy of Reform.—In connexion with foreign affairs during this period it may be added that, by arbitration at The Hague, the sea boundary between Sweden and Norway was fixed in accordance with Sweden's claim, and Sweden became a party to the North Sea and Baltic Agreement of 1908. By dint of close coöperation between the Government and the Riksdag a large number of important reforms were instituted. Among those carried through during Adml. Lindman's administration may be mentioned (in addition to the franchise measures above noted) the creation of a supreme administrative Court of Justice (*Regerings rätten*), together with a legal council, formed of some members of the Supreme Court, as advisers to the Government in legislative matters. Civil marriages were made permissible for all members of the State church. New laws were introduced as to farmers' tenancies and the leasing and letting of houses, flats, etc., and the speculative operations of the big companies dealing in land in Norrland were restricted and placed under control. A new company law was passed by the Riksdag and also a new banking law. A progressive income and property tax, based on the taxpayer's own statements as to both, was also introduced, together with a progressive inheritance tax. Custom-house duties were remodelled and the sugar-tax modified. An arrangement was come to with the Grängesberg Co. in regard to its iron-ore business in Lapland, by which the complicated question of proprietorial rights was so settled that the State joined in as part owner, receiving preference shares to the value of 40,000,000 kr., a specified royalty on the proceeds of the mining at Gellivara and Kirunavara and the right of redemption after a specified period. Large grants were made to the electric power stations at Trollhättan and Älvkarleby in central Sweden, as well as to that at Porjus in an uninhabited region of Lapland, and a widening of the Trollhätte canal was put in hand. A new law regarding insurance against illness was passed. Night work in certain occupations was forbidden for women. Improvements were made in higher technical education. In 1909 a sharp conflict arose between employers and workmen, and the latter organized a general strike in which nearly 300,000 took part. There were, however, no disturbances, thanks both to the discipline maintained and to the wise measures adopted by the Government. Social life was not brought to a standstill, as the workmen expected, and after a lapse of two months the conflict was brought to an end.

While the reforms introduced by Adml. Lindman's Ministry lay mainly in the sphere of economics and industry, the Staaff Ministry devoted its energies more especially towards social questions. A new social department was instituted, as a centre for the State's activities in this direction. The law bearing on the protection of workmen was extended, and various forms of workmen's unions were placed under control. A law was passed regulating the methods of dealing with alcoholists. The profits of the sale of spirits by the communes were allocated to the State, compensation being allowed therefor, the object of this being to free the communes from all economic interest in the liquor trade. After long preliminary planning, an illness and old-age pensions insurance law was passed, enacting obligatory insurance, with payments in three degrees, for all, except pensioners of the State, between the ages of 16 and 66, the pensions to be given in case of illness, or on the completion of the 67th year.

The War Years, 1914–8.—In the ministry which Herr Hammarskjiöld formed in Feb. 1914 Herr K. A. Wallenberg, the banker, was Minister of Foreign Affairs; Herr Dan Broström, shipowner, Minister for Naval Defence, and Herr Oscar von Sydow was Minister of the Interior. The Second Chamber was dissolved, and after a very sharp contest the advocates of active defence measures were returned in increased numbers, but without having secured a majority, polling 86 seats out of 230, while the Liberals numbered 71 and the Social Democrats 73.

The Riksdag met again in May, and the outbreak of the war brought with it a solution of difficulties, inasmuch as all parties recognized that there must be no disputing as to details of defence at a moment when the whole surrounding world was aflame. Universal military service had already been introduced, but now the training time for infantry was increased to 340 days, of which 250 were to be spent in recruit classes beginning in the autumn and continuing throughout the winter, followed by the usual training courses during three years. In order to secure non-commissioned officers of the right kind it was judged well to impose a longer training time, extending to 485 days, on students and other young men of similar standing, while for cavalry and artillery the period was fixed at 365 days. Large sums were allotted for the provision of war materials and for the strengthening of the coast defences. A programme was drawn up for adding new vessels to the fleet. Simultaneously with these steps towards increasing the defences of the country, measures were introduced for modernizing the existing code of punishments for military offences, this being accompanied by the creation of a special official, to be appointed by the Riksdag, whose duty it would be to inquire into all allegations regarding abuse of power or other derelictions on the part of superior officers in the army or navy—an appointment designed to act as a protection for soldiers and sailors against injustice.

An official declaration of neutrality was published without delay, and all the ministries holding office during the war, with the Riksdag's expressed approval, aimed at remaining absolutely neutral. Neutrality involved the duty of preventing any of the belligerent Powers from using Swedish territory as a basis for operations against enemies. Throughout the entire war the Swedish fleet remained on guard along the coasts of the country and on several occasions it had to take active measures. During the summer of 1916 there were many violations of neutrality in Swedish waters. In order to elude the observation of foreign battleships, trading vessels, flying the flags of belligerent countries, or carrying dangerous freights, sought to get through a channel called Kogrundsrännan within Swedish waters in Öresund, and apparently frequent attempts were to be expected on the side of belligerent countries at both ends of this channel to seize enemy vessels even at the risk of this occurring within Swedish waters. This channel was closed therefore against all but certain known Swedish vessels. The Allied Powers considered this action incorrect and protested, but the channel remained closed until Dec. 1918. A number of trading vessels belonging to the Allied Powers, which, owing to the closing of the channel, were confined in the Baltic, were, however, allowed egress on the condition that the Swedish population received a certain measure of necessary supplies from the west.

The stagnation produced by the outbreak of the war as regards foreign trade and shipping did not last long. Sweden became for a time, like Holland and Italy, an intermediary in the American trade with Germany, quite in accordance with international law as it stood before the war. When, however, the Allies proceeded to employ more and more stringently their weapon of blockade against the Central Powers this business as intermediary came quickly to a stop. The intensifying of the war at sea brought with it great obstacles in the way of neutral commerce. Its most painful feature was the sinking of neutral vessels by the German submarines, with its accompanying loss of lives. The mines which were spread about by other groups of belligerents also claimed many victims. The proceedings of the submarines called forth much indignation, and protests were made, but without much effect. The measures of the Allies were of a different order, but their control over shipping presently became so oppressive that protests against this also were made, the weightiest protest coming from the three northern kingdoms acting together. Sweden's geographical position and the commercial conditions which existed before the war necessitated the maintaining of relations with both sides. Trade transactions with Germany were in 1913 somewhat in excess of those with Great Britain, but Great Britain was the larger purchaser of Swedish products. During the war one great displacement in trade resulted from the diminution of Sweden's imports of coal from Great Britain and the consequent necessity of making good this diminution by imports from Germany.

Despite all the difficulties to be encountered it proved possible to maintain importation into Sweden from the west of raw materials, grain and other necessaries down to well on in 1916, but from this time onwards there was an increasing scarcity. When the Allies intensified their blockade, and Sweden could not break off trade relations with Germany, the blockade-line was drawn not between Sweden and the Central Powers but west of Sweden and the other Scandinavian countries. All goods which had to pass the blockade-line in the North Sea on the way to or from Sweden were subjected to sharp control. As regards goods from Sweden certificates of origin and ownership had to be furnished, to make sure that they were not in reality disguised exports from Germany, while in the case of goods for Sweden guarantees were required to the effect that they would not be forwarded to Germany. Suspected goods were unloaded in British seaports. Black lists caused serious losses to conscientious tradesmen as well as to others. Both groups of belligerents set on foot elaborate systems of trade espionage in neutral countries. In order to regulate the undertakings which the belligerents demanded from merchants, manufacturers and shipowners, the so-called War Trade Law was passed in 1916 to give legal value to officially recognized undertakings to foreign Powers, while at the same time it was laid down that undertakings not thus recognized lacked all legal value. A special trades commission was created to investigate all questions connected with this matter. The international goods exchange came to be worked like an enormous system of compensation, controlled by State officials by means of agreement. Every neutral country had to offer some equivalent in return for its imports. During the first years of the war it was to the interest of the Allied Powers that goods should go through Sweden to Russia. The great consignments caused inconvenience to the Swedish railways, but they made things easier for Sweden in the matter of imports.

Negotiations were set on foot for a commercial agreement between Sweden and Great Britain and her Allies, but they led to no result during the time of Herr Hammarskjiöld's Ministry, and this fact was turned to account against him in the political conflict which went on over the internal affairs of the country. After this Ministry resigned on Mar. 1 1917, and Herr Carl Swartz formed a new Government, the Foreign Minister, Adml. Lindman, brought about a temporary agreement by which the Swedish people were allowed the right to import nearly 92,000 tons of grain and about 40,000 tons of other goods, on the condition that certain vessels belonging to the Allies then confined in the Baltic should be allowed egress through the closed channel of Kogrund.

After Herr Eden's Ministry succeeded to that of Herr Swartz in the autumn new discussions were entered upon in regard to imports. In Feb. 1918 a so-called *modus vivendi* agreement was come to, enabling Sweden to import about 75,000 tons of maize, feeding-stuffs, raw phosphate, mineral oils and coffee, and in June a more comprehensive agreement was reached, in accordance with which it was possible to import larger quantities of grain, feeding-stuffs coal, oils, india-rubber, cotton, wool, hides, etc. In this connexion Sweden placed at the disposal of the Allies a portion of her commercial fleet. In addition, Sweden guaranteed to the Allies a certain share in her iron-ore exports, and also undertook to allow a certain amount of credit for goods bought in Sweden. In this way Sweden's most essential import was made sure of until the end of the war. In consequence of the universal scarcity the three Scandinavian countries came to an agreement as to the mutual exchange of commodities.

The hard conditions which prevailed during the war brought Sweden and Norway closer together again. After the severance between Sweden and Norway in 1905, and the election of a Danish prince as King of Norway, the relations between the Scandinavian countries had been somewhat cold. King Gustav, who at one time had been the Norwegian Crown Prince, himself took the initiative, and in Dec. 1914 invited the Norwegian and Danish monarchs to a meeting at Malmö, at which the affairs of the three countries as affected by the war came under discussion. Other such consultations followed, for instance at Christiania in Nov. 1917, and the prime ministers and foreign ministers of the three kingdoms also came together, while on some occasions of importance there were meetings at which special delegates were present.

In Jan. 1918 Sweden gave her recognition to the new Finnish State. When, shortly afterwards, the Red outbreak occurred in Finland, there was a strong movement in favour of Sweden's joining in on the side of the newly formed Finnish Government, but when the Russian troops began to take part in the struggle on the side of the Reds, Russia continuing to be a belligerent Power, the Government and the Riksdag agreed that it would not be wise to intervene. Swedish volunteers fought on the side of the Whites, and a couple of Swedish ambulances were sent over. Swedish refugees were brought back from Southern Finland. While the civil war in Finland was still in progress a petition came from the inhabitants of the Åland Is. for Swedish protection against aggression on the part of Russian troops which were stationed there. Troops were sent from Sweden to maintain order on the islands, and they achieved their purpose. When Germany, however, came to the support of the Whites and landed forces on the Åland Is., the Swedish troops were withdrawn.

Economic Measures.—At the very beginning of the war period the Swedish Government carried through several special administrative measures. The exportation of a number of commodities of great importance was prohibited, partly in order that they might be kept for home consumption, partly in order that they might control the exportation by export licences. This system was gradually developed until at last the export of *all* important goods was prohibited. An Industrial Commission and an Unemployment Commission were set up to decide on the measures which should be taken to maintain industrial work and to mitigate the serious condition of unemployment which threatened. A Food Commission was appointed to study the development of the market, and a National War Insurance Commission was charged with the task of dealing with insurances against loss of life and property through the war on the seas, as the private insurance companies were unable to undertake all the risks. The Riksdag's legislative powers were also called into play. A financial Moratorium was instituted at an early date. The Riksbank's obligation to meet its own notes with gold was suspended, and new laws were introduced giving the Government new powers, which were employed when necessary, to effect the compulsory purchase of goods from individuals and to fix maximum prices on commodities. Swedish vessels could not be sold to other countries without the Government's sanction, nor could they carry freight from one foreign country to another. All this accumulation of legal measures, which presently had added to it the law against unreasonable increases in rent, the law against "profiteering" and several others, did not come about at once but grew out of the needs which were created by the conditions of the war period. New organs for war-time administration were formed in the Trade Commission (June 1915) and the Food Control Commission (autumn 1916), the former of which had to apply the War Trade Laws and to supervise exports and imports, while the latter, as the successor of an earlier Food Commission, took in hand the food rationing of the country.

Rationing.—Before the war Sweden produced about four-sevenths of the cereals which she required; the rest had to be imported. On the other hand, she exported live cattle, pork and butter, the production of which was made possible by the importation of feeding-stuffs. The fodder harvest of 1914 was so scanty that it necessitated a reduction of live stock. The importation of cereals was undertaken by the State through the agency of the Food Commission. When there began to be a scarcity in some of the animal foods, and prices suddenly rose, recourse was had to the fixing of maximum prices for the first time in Nov. 1915. In the course of the year also the exportation of animal foods was restricted and producers were obliged, in return for the granting of export licences, to allot a certain proportion of their goods ("compensation goods" so-called) to the State for sale by the communal authorities at low prices to those who were less well-to-do. In the autumn of 1916 the scarcity of animal foods became so serious that rationing had to be decided on, and, even so, anxiety was occasionally felt lest the supplies should fail. The situation was aggravated later by the bad harvest of 1917. In Oct. 1916 it was decided that nobody should obtain sugar without presenting a sugar-card. These sugar-cards gave a person the right to purchase 13 kgm. of sugar a year, with an additional amount for preserving purposes to each family. In Jan. 1917 bread-cards were introduced. Farmers were allowed to retain a certain quantity of corn but had to sell all the surplus to the State. All such stores, whether bought by the State or imported, were rationed out to the rest of the population, who were given bread-cards providing at first allowances of 250 grammes a day to each person, later only 200 grammes, but again 250 in Nov. 1918. Persons engaged in particularly arduous work were allowed extra rations. The bread-cards were used also on journeys. The carrying out of this work of rationing needed very thorough supervision, and this evoked dissatisfaction and annoyance, especially among the farmers. The system was changed in the food control year of 1918–9, each farmer being called upon to supply a certain specified quantity of corn and being allowed to do more or less as he pleased with what he had left. Rationing ceased at the end of Aug. 1919.

The supply of bread was scantier than in normal times, and it had to be supplemented with other food-stuffs, especially potatoes. The consumption of all these rose enormously and a great scarcity began to be felt, most severely in the late winter and in the spring of the year 1917 and 1918. People had to have recourse to the eating of turnips. In the spring of 1917 there were food riots in various localities. In 1918 the danger of famine became worse, but calm prevailed. In the autumn of that year potatoes also had to be rationed, but this expedient did not work well. In densely inhabited localities milk was so rationed that the needs in the first place of small children, then of pauper children and the old and the sick were supplied. The exportation of meat, including bacon and pork, ceased altogether in the first half of 1917. The scarcity of fodder became at times so intense that moss and heather and even pine-needles had to be employed as substitutes in the cow-sheds. The selling of bacon and pork was placed under strict control, but only with the result that both disappeared almost altogether from the open market. The rationing of butchers' meat was considered, but it was not thought safe to take this step. Among other things rationed was coffee. The scarcity of food generally caused the Government to do what it could to intensify production by the putting of new land into cultivation, etc.

The Fuel Question.—The fuel question was beset with difficulties although Sweden is so rich in wood. Before the war about 5,000,000 tons of coal and coke were imported, for the most part from England. When, during the war, the importation from England ceased, and Germany was unable to supply as much as England used to do, the country was faced by a very serious scarcity of fuel. This was at the beginning of 1917. The regulation of the business of the wood supply was then entrusted to the Fuel Commission, which put wood-cutting operations in hand on an enormous scale. In Nov. 1917 56,000 workmen were in employment at wood-cutting. Down to May 1918, when the work ceased for the most part, 19,400,000 cub. metres of wood had been cut. Forest owners were allowed to make provision for their own needs. Other households had certain specified quantities allotted to them, according to the number of persons in each, special wood-cards being provided and the price of the wood being fixed at figures which did not quite cover the cost. Those persons who wished to buy more could do so but at higher figures. Factories and railways had to pay higher prices. The result was that fuel was always available in sufficient quantities, but that the wood supply involved a loss to the State of over 100,000,000 kronor.

Industry during the War.—The importation difficulties reacted also upon industries. There was a great scarcity of lubricants. This was partly met by the use of substitutes. The textiles, rubber and leather industries, as well as several branches of the chemical industry, suffered from the lack of raw materials. The scarcity of copper and certain other metals and metal alloys had injurious results on the working of electrical machinery and generally throughout the whole sphere of mechanical engineering, but, on the whole, Swedish industries were kept going under favourable conditions. To deal with the importation of raw materials, which was controlled by the Allies, import associations were formed by the manufacturers who needed the raw materials in question. These associations furnished the guarantees required by the Allies and imposed corresponding guarantees on the delivery of the small quantities thus dealt out. The associations were controlled by the Trade and Industry Commissions. In cases where the supply of certain goods was exceptionally small the State laid claim to the whole, and a system of rationing was sometimes carried out by Raw Material Associations, formed by the manufacturers and craftsmen who were in need of them. In 1916 steps had to be taken in regard to regulations for the sale of lubricants, iron pyrites, German iron, and hides, skins and printing paper. The first article to be appropriated by the State was linseed oil, next came hemp and india-rubber. In 1917 hides and skins were appropriated, as well as lubricants, leather shoe-soles, several metals, rails, paraffin, etc. Tickets for the purchasing of benzine for motor-cars and motor-boats were provided through the agency of the Industry Commission. All fat from the bones of mammals and all offal, etc., were turned to scientific or technical account. The use of carbide lamps increased swiftly, as carbide is a Swedish product. The Swedish iron-works and factories were constrained to supply iron goods at reduced prices to cultivators of the soil. In April 1918 rationing of wool began, as well as of cotton yarn, woollen or cotton stockings and woollen or cotton textiles and underclothing of these materials. Purchasing cards were supplied only where the need of them was genuine and "controlled." In Nov. 1918 the rationing ceased.

There was actually no very serious unemployment during the war. A great number of men who lost their work in the building and textile industries were employed in wood-cutting, clearance work in the forests, executing orders for supplies of stone for the communes, etc.

High Cost of Living.—High prices were the combined result of scarcity and the inflation of paper money. The prices of goods rose higher than in Great Britain, for example. Official investigations show that if a family which had an income of 2,000 kr. in 1914 sought to keep up the same kind of living its expenditure would have been increased to something over 3,000 kr. a year according to the prices which prevailed in May 1917, and to over 4,850 kr. according to those which prevailed in Oct. 1918. Wages had to be raised considerably. The State granted war bonuses which amounted in all to a sum total of 100,000,000 kr. a year. The State and the communes expended large sums also in subsidies. From Dec. 1916 down to the middle of 1920 the sum of 112,500,000 kr. was used for lowering the prices of food, clothes and fuel and, in some exceptional cases, rent, for the poorer classes. Of this amount the State provided 77,000,000 kr. During the first half of 1918 389,000 families, or 1,344,000 persons, benefited by purchasing goods at these lowered prices. The building industry was at a standstill almost entirely. The State took steps to help it but without much success.

Changes of Government.—At the beginning of the war all the burning questions of internal politics were put on one side, and all efforts were concentrated on solving the problems presented by the new condition of affairs. In the autumn of 1914 the new elections for the Second Chamber took place. The party of the Right remained unchanged in numbers, 86, the Liberals numbered 57 and the Social Democrats 87. Dissatisfaction with Herr Hammarskjiöld's Ministry increased gradually, the Government—as always happens—being held to blame for the hardships of the times. The Opposition contended that the ministers showed a lack of diplomacy in their negotiations with Great Britain and that they had not paid due regard to the opinions of the Riksdag—certainly the coöperation between the Government and the Riksdag was not what it might have been. In March 1917 the Ministry resigned. In an address with 600,000 signatures Herr Hammarskjiöld and his colleagues were urged to continue in office, but they persisted in their desire to withdraw. Herr Carl Swartz, who previously had been Financial Minister, formed the new Government, which was Moderate Conservative in character.

The Swartz Ministry, in which Adml. Arvid Lindman was again Foreign Minister, lasted only into the autumn. From the start it had borne the stamp of a stop-gap Ministry, inasmuch as the new elections were to be held in September. These went against the Right because, among other reasons, the prevailing hardships and the various measures of State interference were laid to their blame. The Right polled 59, the Liberals 62, the Social Democrats 86, while two new parties, the "Bondeförbund"—a league of farmers and countryfolk—and the Socialists of the Left came in with 12 and 11 respectively. The Ministry resigned and the King tried to arrange for a Coalition Government representing all parties. This effort proving unsuccessful, the Liberal leader, Prof. Nils Eden, undertook the task of forming a Liberal-Social-Democratic Government. The prime minister himself, the Foreign Secretary, Herr J. Hellner, and five other members of the Government were Liberals; Herr Hjalmar Branting, the leader of the Social-Democratic party, was for a short time Finance Minister; Baron Erik Palmstierna, a former naval officer and a Social-Democratic member of the Riksdag, was Minister of Marine; there were two other Social-Democratic members of the Government, which adopted a Liberal-Radical programme.

After the War.—The Riksdag of 1918 passed, among their legislation, a new Poor Law and a new Education Law, reflecting the increased influence of the wage-earners. The wind of reform blew more and more strongly in the autumn. An extraordinary meeting of the Riksdag was called and very noteworthy decisions were come to, which were ratified by the Riksdags of 1919 and 1921, involving (*see* under *Constitution*, above) an immense democratizing of the administration. The consequences for the First Chamber showed themselves at once, when the Government dissolved it in the autumn of 1919 and the new election took place. The chamber had been made up of 86 Conservatives, 43 Liberals, 19 Social Democrats and two Socialists of the Left. This was now altered to 38 Conservatives, 40 Liberals, 19 members of the "Böndeförbund," 49 Social Democrats and four Socialists of the Left. The greatest novelty lay in the women's vote and in their eligibility for both chambers of the Riksdag.

After the termination of the war in Nov. 1918 the emergency measures were almost entirely abandoned. The regulation of the bacon-and-pork-selling business ceased in Jan. 1919 and the rationing of potatoes in May. In Aug. bread-cards disappeared and the rationing of sugar also stopped on Aug. 1. Most of the industrial regulations came to an end during the first quarter of 1919. The Fuel Commission administration of the rationing of fuel terminated on March 1 of the same year. With the close of May the War Insurance Commission ceased its operation. The Riksdags of 1920 and 1921 renewed in modified form some of the emergency laws, but at the end of the first half of 1920 all that remained of the various Commissions were some small committees of liquidation.

When the League of Nations was still in process of formation the Governments of Sweden, Denmark and Norway appointed committees for the purpose of considering together their attitude towards it. The Swedish Government laid its proposal to join the League before the Riksdag of 1920. Opinions were divided: the decision was given in favour of accession by 86 votes against 47 in the First Chamber and by 152 against 67 in the Second. The Riksdag incorporated in this decision an expression of approval of the basic principles of the League, but formulated also its conviction that the Government should avail itself of every opportunity for urging that the States not invited at first to join the League should be incorporated in it as soon as possible; that a more satisfactory arrangement should be come to for the representation in it of the smaller States; that more definite rules should be framed for the meetings of delegates and for their methods of work; that the standing international tribunal should be constituted as soon as possible, and that its procedure in regard to mediation and arbitration should be more clearly defined and further elaborated; and also that efforts to bring about a universal and effective reduction of armaments should be set on foot without delay and vigorously pursued.

Sweden was represented at the International Labour Conference in Washington in 1919 and at that in Genoa in 1920, as well as at the League of Nations' first meeting at Geneva in 1920, when the Swedish delegates acted on the lines indicated in the Riksdag's utterance. In May 1921 the question between Sweden and Finland as to the sovereignty over the Åland Islands was settled by the League of Nations in favour of Finland (*see* ÅLAND ISLANDS).

Sweden did not formally recognize the Soviet Government in Russia, but at first a Russian representative was allowed to reside in Sweden to maintain the *de facto* relations between the two countries. In Jan. 1919 he was obliged to leave (but not until

Swedish residents in Russia had been enabled to return home) because of oppressive conduct in Russia towards Swedes and in regard to Swedish property. All trade relations were for a time broken off, but to an enquiry from the Allied Powers as to whether Sweden would take part in a blockade of Russia a reply in the negative was given. In 1920 permission was accorded to a Russian trade delegation to visit Stockholm. From the Russian side large orders for railway engines were placed with Swedish manufacturers, and much Russian gold passed through Sweden, mostly destined for America.

The Eight-Hour Day.—Within the ranks of the Eden Ministry there was from the beginning a fundamental divergence of view between the Liberals and the Social Democrats, but for some time it was possible for them to work together. Moreover, this Ministry was the only one for a long time past which had a genuine majority, though a very heterogeneous one, in the Riksdag. The most important measure introduced in 1919 was for a legalized eight-hour day, but when first proposed it was rejected by the First Chamber. The Government dissolved the Chamber, and after the new elections an extraordinary autumn session was called at which the eight-hour day proposal was accepted. The Right had retained only 38 seats, the Böndeförbund coming back with 19, the Liberals with 41, the Social Democrats with 49, and the Socialists of the Left with three. According to this law, which was to hold good provisionally until the end of 1923, 48 hours in the week constitute work-time in industrial and other businesses in which at least four employees work at an employer's expense, agricultural work and forestry work excepted. As a general rule over-time must not be instituted to a greater degree than 150 hours in the year. A newly founded institution, the Labour Council, decides questions concerned with the carrying out of the law. A number of flaws were soon discernible in the law, and in the Riksdag of 1920 this Council applied to the Government to effect certain improvements. A proposal was laid before the Riksdag of 1921 and was in the main accepted. The modifications left the main principles of the law unchanged. Sweden subsequently declined to ratify the draft of the Washington Convention of the League of Nations on hours of labour, partly because it conflicted with the Swedish measure already passed, and partly because adhesion would be binding for 11 years, while the Swedish law held good provisionally for a shorter period.

The Social-Democratic Ministry.—It was over the communal taxation question that the Eden Ministry went to pieces. This question had for a long period been under discussion, and it was intended to submit some proposal in connexion with it to the Riksdag of 1920. The Social-Democratic members of the Government asked for a definite settlement, while the Liberals wanted only a provisional solution. The end was that the entire Ministry resigned, and that the King invited the Social-Democratic leader, Herr Branting, to form a new Government. In March 1920 he did so. Baron E. Palmstierna, formerly Minister of Marine, became Minister of Foreign Affairs. All the ministers were Social Democrats. The new Government could only count on minorities in both Chambers as a regular Ministerial party. The discussion of the communal taxation question ended in a victory for the Liberal standpoint, a provisional arrangement. In the meantime the Ministry awaited the result of the general elections to the Second Chamber in the autumn of 1920. A comprehensive programme was put forward by means of commissions of inquiry into projects of socialization, industrial democracy, and the control of trusts and other great combinations.

Change of Ministry.—Dissatisfaction with the eight-hour day and with the socialistic projects brought a good many electors over to the party of the Right. The strength of the Social-Democratic party in the Second Chamber went down from 86 to 75, and the number of the Liberals was reduced from 62 to 47, while that of the Right went up from 59 to 70 and of the Böndeförbund from 10 to 29. The Socialists of the Left were reduced from 11 to 7, a result of their sympathies with the Russian Communists. Two members of the Chamber were "independents." The more than usually complex party conditions led the King to invite Baron Louis de Geer to form a non-political Ministry. Count Herman Wrangel quitted the post of Swedish minister in London, in which he was succeeded by Baron Palmstierna, to become Minister of Foreign Affairs. The new Government began at once to occupy itself seriously with industrial, commercial and financial matters. Among other bills which it put before the Riksdag of 1921 was one for increasing the duty on coffee. On this being rejected Herr Tamm, the Finance Minister, resigned, and the prime minister, too, then resigned. He was succeeded by Herr Oscar von Sydow, former Minister of the Interior.

The Economic Crisis of 1920–1.—During the latter half of 1920 Sweden had entered on a grave economic crisis—her share of the general economic difficulties which prevailed after the war. The period from the dissolution of the union with Norway in 1905 down to 1914 has been characterized as one of great economic development. During and after the war cost of production rose swiftly, not least because the workmen, after the passing of the Eight-Hour Day Act, in most cases obtained higher rates of wages so that they could earn as much as when working longer hours. Compensation had already been allowed them for the increase in prices. As soon as importation possibilities became increased after the war, goods began to be imported to an extravagant degree, so that the country became flooded with them to the detriment of home industries. Finally the Swedish exchange, which stood somewhat higher outside than inside the country, facilitated importation but hindered exportation. When the international crisis came, with its swift fall in prices, it became necessary to lower wages again, but this brought the country up against great difficulties. In April 1921 about 60,000 industrial workmen were unemployed; in June about 90,000.

The Swedish Red Cross.—Some account of the activities of the Swedish Red Cross must have its place in an outline of Swedish history during and after the war. King Gustav's brother, Prince Carl, played a leading role in this connexion, and also the Crown Princess Margaret (daughter of the Duke of Connaught), whose death in 1920 was sincerely mourned. The work of the Swedish Red Cross was directed more particularly to relieving prisoners of war in the various countries, above all in Russia on the one side and Germany and Austria-Hungary on the other. During 1915–8 a great number of invalided prisoners, including 3,617 Germans, 22,123 Austro-Hungarians, 428 Turks and 37,295 Russians, were brought homeward through Sweden by means of the Swedish Red Cross, specially equipped trains travelling between the Swedish-Finnish frontier in the north and Trälleborg in the south. Across Sweden, moreover, there went a stream of parcels by post, in both directions, for prisoners. The Swedish postal service dealt with 12,700,000 parcels of this kind. The Crown Princess was specially interested in collecting books to despatch to the prisoners' camps. Important work was also done in the inspecting of the prisoners' camps in Russia, Germany and Austria-Hungary. Delegates distributed gifts from home among the prisoners: 1,016 railway waggons packed with such gifts passed through Petrograd *en route* eastwards, and from Russia 1,012 travelled into Germany and 304 into Austria-Hungary. The delegates drew attention to various shortcomings in the German camps and in most cases this resulted in improvements being effected. The conditions in Russia and Siberia were found to be much worse. Delegates' records of what they saw revealed a terrible condition of things in many camps. In some there were 30 deaths a day among the prisoners. Under the guidance of the Swedish delegates new hospitals were established in many places or old hospitals improved, kitchens and baking-rooms being constructed, drains put into order, and large stores of medicines and bandages, etc., being supplied. In Jekaterinburg, for instance, the authorities threw all care for the prisoners entirely on the Swedish delegates within a region of 1,200 sq. miles. Thirty-three hospital buildings were erected in this region, and at some periods a Swedish Red Cross Kitchen established there was able to distribute food to 1,200 men a day. This work was attended with risks. Two delegates were murdered and several died in hospitals for infectious cases. During the Finnish civil war two ambulances were sent to Finland in 1920, and one ambulance was sent to Poland to help in coping with the epidemic there.

The grave privations in many countries after the war due to the scarcity of food aroused deep sympathy in Sweden. Among other steps taken to afford help may be mentioned the welcoming of 20,000 children from Germany and Austria (and in some degree from the Baltic Provinces) to stay in Swedish homes with a view to their regaining health and strength. The homes of both the well-to-do and the poor were thrown open for this. The total amount of money devoted to such acts of helpfulness (including the cost of the children's visits) is estimated at more than 25,000,000 kr., of which the State was responsible for 1,500,000 and the rest was collected by private subscriptions. A detailed report was laid before the International Red Cross Conference in Geneva in 1921. (K. H.*)

SWEET, HENRY (1845–1912), English philologist, was born in London Sept. 15 1845. Educated at King's College, London, Balliol College, Oxford, and Heidelberg University, he was a recognized authority on the subject of phonetics (*see* 21.460–61; 9.597), and a readership in phonetics was specially created for him in 1901 by the university of Oxford. His published works include an *Anglo-Saxon Reader;* a *Student's Dictionary of Anglo-Saxon;* an *English Grammar; The History of Language,* and many editions of Old and Middle English Texts. He died at Oxford April 30 1912.

SWETE, HENRY BARCLAY (1835–1917), English theologian, was born at Bristol March 14 1835. He was educated at King's College, London, and Caius College, Cambridge, and in 1858 was ordained. After some years of work in various country curacies and livings he became in 1869 theological lecturer and tutor at Caius College. In 1881 he became examining chaplain to the Bishop of St. Albans, and the following year was appointed professor of pastoral theology at King's College, London. In 1890 he succeeded Westcott as regius professor of divinity at Cambridge, and retained this position until 1915, when he retired with the title of emeritus professor. He was in 1911 appointed an hon. chaplain to the King. Swete's works on Biblical texts are of the highest importance. In 1887 he published the first volume of his edition of the Greek text of the Old Testament, completing the series in 1894 (3rd ed. 1901–7), while in 1898 appeared the Greek text of the Gospel of St. Mark, with notes and introduction (2nd ed. 1902) and in 1906 that of the Apocalypse of St. John (2nd ed. 1907). He was the editor of *Cambridge Theological Essays* (1905) and *Cambridge Biblical Essays* (1909), and was a contributor to Smith and Wace's *Dictionary of Christian Biography* (1882–87) and Hastings's *Dictionary of the Bible* (1899–1900). He also produced many historical and critical works, including *The Apostles' Creed in Relation to Primitive Christianity* (1894; 3rd ed. 1899); *Church Services and Service Books before the Reformation* (1896); *Patristic Study* (1902); *The Appearances of Our Lord after the Passion* (1907; 2nd ed. 1908), and *The Last Discourse and Prayer of Our Lord* (1913). He died at Hitchin May 10 1917.

SWIMMING: *see* SPORTS AND GAMES.

SWINFEN, CHARLES SWINFEN EADY, 1ST BARON (1851–1919), English lawyer and master of the rolls, was born at Chertsey, Surrey, July 31 1851. He was educated privately, and in 1874 was admitted a solicitor, but in 1879 he was called to the bar, having been during his period as a student a pupil of Cozens-Hardy. In 1893 he became a Q.C., and in 1901 was raised to the bench of the Chancery division and knighted. In 1913 he became a lord justice of appeal, and in 1918 master of the rolls in succession to Lord Cozens-Hardy. He retired in 1919 and was raised to the peerage only a few weeks before he died in London Nov. 15 1919.

SWITZERLAND (*see* 26.238).—Before dealing with the affairs of Switzerland during 1909–21, a note may be made on a curious theory recently put forth, especially in Romance Switzerland, that the Swiss Confederation is "the oldest republic or democracy in the world." Now certainly a "king" has never ruled in Switzerland (save in the case of Neuchâtel before 1857), nor since 1648 has any emperor ever had any claim on the allegiance of the Swiss. But then we must recollect that till 1798 Switzerland never had a *single* head, whatever he might be entitled. If we take the term "republic" to mean a "democratic Government," it is quite true that there were (and are) "republics" of that kind in various regions of Switzerland (*e.g.* Schwyz), but what is true of a part is not true of the whole. Again, before 1798 there was no Central Government at all in Switzerland, while it was only in 1848 that it first possessed a "President" (with very limited powers). But there was a president already in 1787 in the United States of America, while the "free communities" or "republics" of Andorra (in the Pyrenees) and of San Marino (Italy) are far older than any such in Switzerland. Naturally the use of the word "*Republik*" by certain cantons before 1798 (*e.g.* the "*Stadt und Republik* Zürich") referred to the rural districts of each, and these by no means enjoyed "democratic government" at the hands of their respective towns. The fact that in 1848 the first "democratic Swiss Constitution" (still in force so far as regards the practical details relating to the Central Government) was avowedly based on that of the American republic is sufficient to disprove the quaint theory that Switzerland is the (in any sense) "oldest Republic in the world." The reverse is really more nearly the case. In neither of the two ordinary senses of "republic" is this theory even approximately accurate.

Population.—As regards resident population, the results of the last two Swiss censuses, Dec. 1 1910, and Dec. 1 1920 (only the provisional results, published in Feb. 1921), were as follows:—

	1910	1920
Total	3,753,293	3,861,508
Languages		
German	2,594,298	..[1]
French	793,264	..[1]
Italian	302,578	..[1]
Romansch	40,122	..[1]
Other languages	23,031	
Religions		
Protestants	2,107,814	2,218,589
Roman Catholics	1,593,538	1,586,826
Jews	18,463	20,955

[1] Figures not published up to Jan. 1 1922.

The decrease in the number of the Roman Catholics is mainly due to the fact that in 1910 the "Christian Catholics" (Old Catholics) were reckoned among them, whereas in 1920, for the first time, they were counted separately, the number given, however (56,250), being greatly exaggerated, since in Tessin (where there is none of this sect) many Roman Catholics described themselves as such under some error. It is noteworthy that the Jews were in 1850 only 3,145 in number, but in 1910 already 18,463, and in 1920 20,955.

In five cantons the population has diminished (Outer Rhodes of Appenzell, St. Gall, Tessin, Vaud and Neuchâtel). In recent years there has been much fear expressed in Switzerland that the non-Swiss were increasing too rapidly for the welfare of the land. This no doubt was due to the vast immigration of German, French, and Italian workmen, who asked lower wages than the Swiss, and, when settled down, became exempt from military service in their native land. During the World War many returned home, and so the figures are not so alarming as was feared at one time. Here is a complete list:—

1860	114,983, of which 1,202 were British subjects;	
1870	150,907	(British subjects 2,297)
1880	211,035	(British subjects 2,812)
1888	229,650	(British subjects 2,577)
1900	383,424	(British subjects 3,535)
1910	552,011	(British subjects 4,118)
1920	410,983	(British subjects, figures not available).

Thus the percentage rose from 57 per thousand in 1860 to 79 in 1888, and to 116 in 1910, the culminating point being reached in 1900 with 147, so that the 1920 figures of 106 show a distinct decrease, largely due, like the diminution of the Roman Catholics, to the greater number of French citizens who have gone from Geneva back to France. In 1920 the 12 most populous towns in Switzerland (number of residents) were: Zürich, 205,892 (190,733 in 1910); Geneva, 138,034 (123,153 in 1910); Basle, 135,134 (132,276 in 1910); Berne, 103,990 (90,937 in 1910); St. Gall, 69,651 (75,482 in 1910); Lausanne, 67,852 (64,446 in 1910); Lucerne, 43,696 (39,339 in 1910); La Chaux de Fonds, 37,591 (37,751 in 1910); Winterthur, enlarged, 49,491 (46,384 in 1910); Bienne, enlarged, 34,414 (32,401 in 1910); Neuchâtel, 22,951 (23,741 in 1910); and Fribourg, 20,468 (20,293 in 1910). No other Swiss town has a population attaining 20,000, though Schaffhausen is not far off with 19,930 (18,101 in 1910). There are also 14 Swiss towns with populations below 20,000, but over 10,000. The increase in the case of Berne is due to its absorption of the suburb Bümpliz, etc., and in the case of Bienne to increased prosperity, while the decrease in the cases of St. Gall, of La Chaux de Fonds and of Winterthur are to be accounted for by industrial depression, and the departure of many workmen.

As the "Conseil National" is elected in the ratio of one member for 20,000 of the total population or fraction surpassing 10,000, the new census will increase its members by eight, so that henceforth it will have 197 members.

Politics.—The members of the Swiss Federal Executive (*Bundesrat*) were almost all changed in the period 1910–20, so that in 1921 the seniors were G. Motta (first elected in 1911), and E. Schulthess (first elected in 1912). The five other actual members had all entered the Council since 1917—R. Haab in 1918, Karl Scheurer, E. Chuard, and J. Musy, all in 1919, and H. Häberlin in 1920. E. Chuard was the oldest in years (b. 1857), while J. Musy was born in 1876. Thus the Council had been greatly rejuvenated. Six members were Radicals, Signor Motta being the only Conservative and Roman Catholic.

The recent presidents of the Swiss Confederation (little more than the chairmen of the Federal Executive) have been A. Deucher (1909); R. Comtesse (1910); M. Ruchet (1911); L. Forrer (1912); E. Müller (1913); A. Hoffmann, (1914); G. Motta (1915); C. Decoppet (1916); E. Schulthess (1917); F. L. Calonder (1918); G. Ador (1919), and G. Motta (1920); while the president for 1921, E. Schulthess, would in 1922 be succeeded by the vice-president, R. Haab. Of late years the Political Department (*i.e.* the Ministry of Foreign Affairs) has become specially important. A resolution of the Federal Executive in 1917 decided that this important department should *ipso facto* be attributed to the president. But, as the president changes annually, this plan was soon found very inconvenient, and so in 1920 a return was made to the older system that each councillor should retain the department assigned to him. Hence G. Motta would be Foreign Minister till Jan. 1 1923, when the date of fresh election came round again.

The Swiss people adopted by a popular vote the principle of proportional representation for elections to the "Conseil National" in Oct. 1919. But though it was expected that the Socialists would win many more seats they only won much fewer. The Radical majority was reduced from 102 to 60, in the Assembly of 189 members, thus losing its absolute majority over all other parties combined, but remaining the strongest single group. Forty-one Socialists (in 1917 but 19) and as many Conservatives were elected, and the new "Citizens and Peasants" party (a split from the Radical party) obtained 28 seats.

Proportional representation was also winning its way in the cantons, Aargau and Fribourg adopting it in 1920, followed in 1921 by Berne and the Valais. Thus 18 of the 22 cantons approved it. Indeed in 1920 the canton of Fribourg, hitherto reckoned one of the most backward as to the recognition of popular institutions, made a great advance, accepting in one day the facultative referendum, the initiative, the election of the Executive by the people, and that of the Legislature by proportional representation. A number of Federal votes have been taken in recent years. The constitutional amendments related to infectious diseases (1913), the creation of an administrative court (1914), the levy of a war tax (1915), the imposal of a stamp tax on certain business papers (1917), regulations as to waterways (1918), a renewed war tax (1918), entry of Switzerland into the League of Nations (1920), and regulations as to hours of work (1920). A law (facultative referendum) as to sick insurance was also accepted in 1912. But of the "Initiatives" two were rejected (proportional representation in 1910—accepted, however, in 1918), and a Federal tax in 1918, but in 1919 the detailed regulations as to the working of proportional representation in the "Conseil National," and a law abolishing gaming houses were accepted. Of four later votes, all in 1921, those relating to popular approval of international treaties of a certain length, and new regulations as to motor-cars and to aviation were accepted, but a fourth relating to military courts of justice was rejected.

At the very beginning of the World War (Aug. 3 1914) the Federal Parliament handed over to the Federal Executive certain extraordinary (emergency) powers of acting, and these powers, excluding all obligatory popular votes were found to be very convenient by the Federal Executive.

The entry of Switzerland into the League of Nations was accepted by a popular vote on May 16 1920, the majority in favour (mainly from the French-speaking cantons) being 97,051 votes and by 11½ to 10½ cantons. But in Feb. 1921 the Federal Executive declined to allow the passage through Switzerland of troops, raised to act as police in the case of the Vilna plebiscite.

Some of the members of the former Austrian Empire have sought a nearer connexion with Switzerland. Liechtenstein was indeed admitted into the Swiss postal, telegraph, and telephone system. But the Vorarlberg (and for similar reasons the Tirol) had not up to Aug. 1921 succeeded in being admitted as Swiss cantons, there being great fear felt in Switzerland of increasing the German-speaking population, and particularly of augmenting the number of strict Roman Catholics.

Finance.—The finances of the Swiss Confederation were in 1921 (so said M. Musy, the Swiss Finance Minister) in a difficult position. Their backbone, in the matter of receipts, even in the pre-war period, was the amount of the customs' duties. But even at that period these produced less than heretofore. The last year when they showed an increase was in 1912 (£3,500,000). After that time the decline was pretty steady, and the deficits higher and higher. It has been estimated that, while in 1913 they sufficed to defray about 84% of the total expenses of the State, in 1919 the amount met only 28% of these expenses (in 1913 £3,360,000, and in 1919 only £2,520,000). And these expenses steadily increased after the outbreak of the war, though, of course, Switzerland was not one of the belligerent Powers. The deficits since 1914 are as follows:—1914, £901,000; 1915, £862,000; 1916, £665,000; 1917, £2,000,000; 1919, £2,475,000, and 1920, £3,980,000—in 1920 the receipts were £13,740,000, and the expenses £17,720,000. Despite the formal assurances of neutrality received from the principal combatants, the War Minister of Switzerland thought it essential to guard all its frontiers with a strong military force, and to erect costly new fortifications (as at Morat), so that at the end of 1920 the total "mobilization expenses" amounted to no less than £47,500,000, while the military expenses in the accounts for 1921 were £2,880,000, and that only an estimate far inferior to the demands of the military authorities. Large loans (nine in number, to the total amount of some £31,200,000) have been contracted, but on these heavy interest has to be paid. Exchequer bills for two to five years at 6% were also issued in order to assure the supply of necessaries of life. Special taxes were imposed, first a war tax (which produced £4,400,000), then a tax on war profits (which produced £11,120,000), next a "renewed" war tax (to last 16 years). The increased salaries and wages of the army of federal officials (including the railwaymen) were a further burden, and, naturally, as the cost of living increased, there came a fresh rise of salaries and wages to meet it—a vicious circle. Even the telegraph and telephone rates had to be raised, not to speak of the postal charges, so that while formerly a letter within Switzerland cost only 1d. it cost 2d. in 1921 and a post card 1d. in lieu of ½d. The charges on foreign correspondence have also been raised, so far as regards the transit from Switzerland to the outer world, for a letter from 2½d. to 4d., and for a post card from 1d. to 2½d. As Switzerland produces very little in the way of raw materials, such as coal, these had to be bought at high prices, a fact which further raised the cost of travelling, hotel prices, and of all articles of home consumption. The only persons who have not felt these raised prices are the self-sufficing (or nearly so) peasants, who, in some cases, have even made large profits by the sale of their milk, cheese, butter, etc. Naturally the towns felt this rise to an extraordinary extent, and great distress and lack of employment resulted. The only cheering symptom, from the Swiss point of view, was that the currency exchange was almost everywhere favourable to Switzerland, save as regards American money. An attempt has been made (Feb. 1921) to raise provisionally certain customs duties but at Protectionist rates, so that the interests of the consumers are being sacrificed to those of certain trades, as well as (also provisionally) to limit imports to a certain extent. In 1912 the customs duties amounted to 6% of the value of the goods imported, but in 1920 not even to 3 per cent.

Hence the deficit in the Federal budget for 1921 was put at five or six million pounds, a huge amount for a country with under four million inhabitants. If the Federal finances were in this state, the cantonal and communal finances were no better.

It must be borne in mind that the direct taxes are paid by a very small minority of Swiss. In the case of the direct taxes the total amount, from 1914 to 1920, was about £70,000,000, while the indirect taxes only brought in some £18,000,000.

Switzerland is still predominantly an agricultural country, so that the majority of voters are peasants, with very narrow views. The industrial population is very much weaker politically, and is regarded with great disfavour by the Agrarian party, which desires, for its own objects, to set up a "Chinese wall" round Switzerland. But the land must have other manufactures than chocolate, condensed milk, cheese, etc., and thus must import much which has to be paid naturally by its exports. Yet the narrow "Cantonal spirit" is still widely diffused in Switzerland.

The annual deficits on the Swiss State railways are especially great. It was officially reckoned that in 1918 the total Federal debt had attained a height of about £33 per head of the population, whereas in 1912 it had only been £17.

Army.—Formerly detailed annual accounts as to the Swiss army (a purely militia force) were published. But since the outbreak of the war these accounts have no longer been issued. But an indiscretion of the semi-official Bernese newspaper, the *Bund* of Berne (June 23 1920), tells us that in June 1920 the numbers were 337,282, of whom 71,993 formed the "second reserve," the rest falling into the "Auszug" or "Elite" and the "Landwehr." The "Elite" includes the younger men from 20 to 32, and the "Landwehr" or first reserve those between 33 and 40, while the "Landsturm" or reserve proper is composed of men between 41 and 48.

At the beginning of the war Col. Ulrich Wille was elected the "General," while Col. A. T. L. Sprecher von Bernegg became chief of the staff. It was thought necessary to guard all the Swiss frontiers, a policy which cost £47,500,000, and disorganized industry and agriculture to a very great extent. The German-speaking troops were sent, as far as possible to the Jura or the French-speaking or the Italian-speaking regions, while the French-speaking soldiers looked after the German-speaking districts. The object was to prevent any fraternization with the troops of the belligerents. Much inconvenience was caused by this mobilization. The military organization was tightened up on the lines of the German army, and this greatly bothered the free Swiss citizens.

Naturally the military budget increased greatly, amounting in 1921 to £3,000,000, though this represented a reduction of about £250,000 on the demands of the military authorities. This great increase is to be explained in part, at least, by the increased cost of material. In 1910 the annual cost amounted only to £1,680,000.

Agriculture, Commerce and Railways.—Censuses of cattle have been frequently made. In 1866 there were 553,205 cows, in 1886 663,102, in 1906 785,950, in 1911 796,909, in 1916 849,011, but in 1919 738,896 and in 1920 only 729,999. The great fall in the numbers is commonly attributed to the huge purchases of milch cows made during the war by Austrian and Hungarian cattle dealers, for export to Germany. Hence came a milk famine, and milk had to be "rationed." Potatoes and other such produce were also rationed and each householder had to plant them on his land, however unsuited for this kind of cultivation.

In 1920 foot-and-mouth disease raged furiously in all parts of Switzerland, and even intercourse between neighbouring valleys was forbidden in order to try to stop the spread of the infection.

During the war certain branches of Swiss commerce flourished much, for, against the wishes and instructions of the authorities, there was much smuggling of all kinds of goods over the frontier, especially towards Germany and France, which, naturally enough, are Switzerland's best customers. The imports were often less than the exports. But in 1915 they were nearly equal in money value, the imports being slightly more than the exports. However, in 1916, the reverse was the case, the exports being £99,000,000, and the imports £93,000,000, but in 1917 the imports had again the best of it. In 1918 the imports amounted to about £96,000,000, and the exports to about £78,000,000. (Great Britain ranked third in each case.) In 1919 the exports amounted to £136,000,000, the highest figure ever attained, and the imports to £143,000,000. But in 1920 the imports rose to the prodigious figure of £169,000,000, while the exports dropped to £131,000,000.

As coal is practically non-existent in Switzerland it must be imported, naturally at considerable cost. Hence the imported supply had to be strictly "rationed" during the war, and the price increased enormously, especially in the case of domestic consumption. Of course, the factories suffered much, and the railways even more. Hence the electrification of the latter was pushed on as quickly as possible. But it was not possible to do this all at once, and so one saw locomotives driven by means of logs of wood. The number of trains was reduced, at one time very much indeed, and the fares pushed up to a great degree, which much hindered communications, even within the country. The first electrically-driven train went through the St. Gotthard tunnel early in 1921. The Lötschberg railway was opened in 1914, just before the outbreak of the war, and thus its prosperity was greatly let and hindered, while on the Valais slope, above Brieg, the unstable nature of the ground has caused many landslips, and thus entailed many costly repairs. But the great scheme for connecting the two stations in Geneva has been indefinitely postponed, owing to its excessive cost.

Social.—In 1912 a vast scheme of insurance against sickness and accidents was accepted on a popular vote. But up to 1921 money was lacking to put it into operation, even though unsuccessful attempts had been made to "earmark" certain items of the revenue.

As everywhere else in Europe the unemployment problem was troublesome in Switzerland. The militia employed in the great mobilization came home, unused to work as before, while work was scarce owing to the lack of money, the higher cost of living, and the rise in the salaries and wages of nearly all classes. Naturally this want of employment was felt most in and near the great Swiss towns. And here came in a fresh complication—the lack of dwelling houses and flats. This was, in part, due to the rush from the country to the towns, and the crisis became very acute, so that in Berne, at least, all foreigners were ordered out of the town, so as to procure lodgings for Swiss workmen. In the rural districts neither unemployment nor lack of dwelling houses was felt to anything like the same degree, though, no doubt, they existed to a certain extent. But these rural regions are inhabited by peasants who do not easily move from their homes, and are occupied in the cultivation of their small bits of land. As in Switzerland there are few persons of means independent of a trade or a profession, the disturbance in social life was very great, while the high taxes and high wages limited the power of employing labour.

Ecclesiastical.—There were several welcome symptoms of the cessation of the "Kulturkampf," or religious strife following on the decrees of the Vatican Council. On Sept. 1 1920, a papal nuncio for Switzerland was named, for the first time since 1873, in the person of Monsignor Luigi Maglione, titular archbishop of Caesarea. He was already favourably known in Switzerland by reason of his love for that country, and his devotion in the case of prisoners of war and sick children. In Feb. 1921, the canton of Berne at last resumed its full legal responsibility for the reconstituted diocese of Basle, after holding aloof for many years, and thus recognized the bishop as spiritual head of the diocese, thus allowing him full liberty of exercising his functions within the canton for an unlimited period (and no longer for five or 10 years, as heretofore). Again, in the census of 1920 the "Christian Catholics" (the Swiss "Old Catholics," who previously had been included among the Roman Catholics) were numbered apart, though by reason of some error in the case of the canton of Tessin their number was put at 56,250; the real number is believed not to exceed 35,000 to 40,000.

On the other hand the Pope laid claim to the direct nomination of the bishop of Sion in the Valais.

The new census has put an end to the topsy-turvy fact that in the canton of Geneva the Roman Catholics outnumbered the Protestants—so many French Roman Catholics have returned to France that the balance has been reversed.

Mention may be made of the fact that, in 1910, in the canton of Basle, the separation of Church and State was carried out, while in the same year women obtained the right of voting in the disestablished Protestant church of Geneva.

In the summer of 1920 reunion conferences were held both at Beatenberg and in Geneva, but almost wholly between various Protestant denominations.

The World War Period.—During the fateful days immediately before the war broke out in 1914, the uncertainty whether there would really be war or whether commonsense would prevail kept the whole of Switzerland in a state of feverish anxiety, and when the loaded dice fell, very many persons in Switzerland were seized with panic. A wild assault was made on all provision establishments which supplied the necessaries of life, and these were bought in mad fashion and in quantities far above what was required. In many families stores of eatables were still found after the lapse of two years, and that quite apart from what had been spoilt. The banks and other establishments of a like kind had to withstand a regular siege, for everyone desired to get his property back. This haste had finally to be restrained by orders issued by the Government. As if by enchantment coins of small denominations disappeared from circulation. Not even at the post-offices was it possible to change Swiss banknotes for large sums. It was especially hard on the foreign tourists who were surprised by this sudden war. No one was any longer willing to change their foreign banknotes and cheques, formerly cashed so eagerly. Only the hotel keepers found themselves forced to receive cheques in payment for their accounts, and that despite the danger of incurring great losses by this act of friendship.

On the Swiss frontiers the blocking of all communications took strange forms. A typical case was that of Basle, close to the northern frontier. The tourists rushed in by thousands, and the railway trains were enormously delayed. With the keenest anxiety everyone sought for a carriage, a motor car, or some kind of cart so as to reach the frontier as easily and as quickly as possible. Many, whose cash had disappeared in consequence of the difficulties caused by the exchange, had to set out on foot, burdened with their luggage, to cover the great distance. These carts themselves were heavily laden with luggage, trunks and band boxes, while high up on these artificial mountains were perched travellers of every land, who to-day shared their common hard fate peaceably, but on the morrow were to oppose each other as enemies. Here was a German professor clothed in homespun, there an Englishman in tweeds, near by were some merry Belgian ladies with huge hats and elegant parasols, and, on top of all, countless schoolboys with caps of diverse colours. So was it all day long in the town. All this wild confusion was caused by the sudden interruption of international communications and the closing of the frontiers.

Thousands also were deprived at one fell stroke of their daily bread. Such were chiefly Italians, who desired to regain Italy over the St. Gotthard or the Simplon, often with only a little cash, sometimes quite penniless, and who were blockaded in Basle, and in incredible numbers, finally some 40,000 of them. All these unfortunates had to be cared for till it was possible for them to resume their journey. Quarters were found in private villas and other dwelling houses for the sick women and children. The Coöperative Society of Basle sent great carts filled with bread and milk, private benevolence made gifts of tea and other eatables. School houses and gymnasiums gave shelter to these unhappy, homeless Italians as far as quarters could be found anywhere, but a great number had to camp out in the open. Only when the great rush had somewhat abated was it possible to facilitate their return to their own country.

Side by side with these arrangements military preparations were carried out in Switzerland. On July 31 1914 the entire Swiss army was warned to be ready, and as early as Aug. 1 the order to mobilize was given. The first day for this was Aug. 3, and two days later the mobilization was quite complete. The troops were ordered to the frontiers which till now had been guarded in part by the second reserve (Landsturm), called out first of all. At the same time (Aug. 3) the Swiss Parliament gave the Swiss executive unlimited powers, even in financial matters. Col. Ulrich Wille was named as commander-in-chief, and Col. Sprecher von Bernegg as chief of the general staff. As it was hoped that the war would not last very long, the mobilized troops went off joyfully to the frontiers. The belligerent States solemnly assured Switzerland of their intention of observing its neutrality, a declaration which brought about a certain amount of relief. When finally the principal operations of war were seen to be taking place far from the Swiss frontiers, the Swiss people were able to think of recalling the troops, in order to simplify matters, from the service on the frontiers, though some were later summoned to relieve those actually serving there. But if in Switzerland a sigh of relief arose, the sad fate of Belgium was felt to be a stern warning, and greatly embarrassed the Swiss authorities, military and political, and it was felt to be quite impossible to strip the frontiers of all watching troops. The fact of this monotonous service, and the conviction that the war might possibly last a long time, brought about a certain disinclination for further service of this kind. Besides, such protection of the frontiers threatened to become costly to an appreciable degree. Therefore much criticism was exercised, chiefly by the Socialists, who especially blamed what, from their point of view, were the mainly needless fortifications around Morat, which were regarded as simply a piece of military display and lavishness, and were considered as a partial measure directed against one only of the belligerents. Thus the Swiss authorities had to order certain alleviations and simplifications in this frontier service. In order to satisfy the agricultural interest the peasant soldiers were called out at a period which caused least disturbance in the cultivation of the land, etc.

Among the military war measures must be counted the abolition, from the beginning, of telephonic communications between the different Swiss towns. This caused all the greater rush to the telegraph offices, and yet even these were under the censor, at least so far as regarded foreign countries.

The equipment of the Swiss army in new, field grey, uniforms was carried out in 1915–6. The expense of these new uniforms amounted to about £800,000.

Most unpleasant for Switzerland was the "Affair of the Two Colonels" (Jan. 15 1916), Egli and von Wattenwyl. This pair of Swiss officers were in regular communication with the German and the Austrian military attachés, ostensibly only for supplying such information as affected no Swiss military matters. All the same this "affair" caused great amazement, especially in French-speaking Switzerland, and in the breasts of the Socialists, who saw in this action of two officers of the Swiss general staff an unneutral and unfriendly act as regards the Entente. They were court-martialed, but were acquitted of the charge of infringement of their official duties, and were handed over to the Swiss executive for "disciplinary punishment" because of their conduct against Swiss neutrality. By this they were each sentenced to 20 days' strict arrest, and to suspension as leading officials in the Swiss general staff. Col. Egli demanded his dismissal at once. The Socialists and a delegation of the Government of canton Vaud required the summoning of the Swiss Parliament in order to discuss the "Affair of the Two Colonels."

About the same time the war control of the Swiss railways was abolished, while a census of Swiss who were not liable to do military service and of arms in private hands was decreed. A later appeal for well-qualified sharpshooters among Swiss citizens resulted in the volunteering of about 100,000 men, of whom, however, only a small percentage was accepted as being really fit for such military service.

Much bad blood was caused in the Socialist camp, and also among other citizens, by the Swiss Government's decision that punishments for certain purely military offences were to be purged in the penal establishments of Witzwil and of Orbe, while in the case of the officers confinement in the fortresses of St. Maurice and St. Gotthard alone was directed. Complaint was also made of the alleged rigorous treatment of ordinary soldiers, and of the far lighter treatment of officers charged with offences.

All this occasioned the promotion of an "Initiative" for the total abolition of courts of military justice. Enough signatures were obtained for this "Initiative," but it was later defeated on a popular vote.

It is easy to understand that Switzerland was the special rendezvous of foreign spies, especially the frontier towns and even the capital, Berne. In this respect all the belligerents did their very best. So even the former director of the Bernese tourist bureau, for taking part in an intelligence service in favour of a foreign Power, was condemned to five months' imprisonment and a fine of £8.

As early as Nov. 1916, the Swiss executive resolved to recruit 250 volunteers out of the army to serve as army police, and this for the entire duration of the war mobilization.

Certain troops, especially those from industrial regions, had to be pacified by the Swiss Parliament by increased pay. This scheme did not find support as late as the end of the year 1916, but was adopted in April 1918, and then it was not merely the pay which was increased, but also the amount of food rations carried in the knapsacks, and emergency support in case of need (this in the case of soldiers' families).

The fact, too, must not be overlooked that in cases of discontent with the military service many unfortunate events contributed to this dissatisfaction. One example was the accelerated mobilization of the 3rd Division (May 1917), and the following endurance marches in great heat, in consequence of which many soldiers were made ill, and fell exhausted on the roads. This brought about an exceedingly vehement movement against all military service, and was utilized to the utmost by the workmen.

In June 1917 the Swiss Government had raised the amounts of the emergency family grants in the big towns to about 2s. a head per day for grown-up persons, and to 8d. for children, while in the smaller towns the respective amounts were 1s. 6d. and 6d. In the same year the length of the relief services was fixed at 2½ months for the younger and active men (Auszug), and at six weeks for the older men of the first reserve or "Landwehr."

Considerable discontent prevailed in French-speaking Switzerland with the chiefs of the Swiss army, who seemed to it too "Germanophile." This went so far that, in course of the discussion by the Swiss Parliament of a report on Swiss neutrality (Aug. 1917), a formal vote of want of confidence was proposed, and the compulsory retirement of the general and of the chief-of-staff demanded. All such proposals, however, were rejected, but they threw a lurid light on the disagreement between French-Swiss and German-Swiss. In the Assembly, however, the assertion of the supremacy of the civil power over the military power was approved, as was also greater economy in the matter of constructing fortifications, etc.

In consequence of the prolongation of the war, and the frequent calling up as reliefs of soldiers without much means, great distress was inflicted on them and on their families, and many could not find work on being released from active service, as their situations had been filled by Swiss citizens exempt from military service and sometimes even by women. In order to alleviate this crying distress a department for the promotion of the welfare of the soldiers was founded by the Swiss executive which gave this department a first contribution of some £18,000 (Aug. 2 1917). Later on came the "National Collection" (a voluntary contribution made throughout Switzerland) which brought in millions of francs. To stimulate this collection specially large medals of copper, silver, and gold were struck, and also brooches made, all being sold to the people. The term and the institution "For the welfare of the Soldiers" must be understood to include also other benevolent institutes for the soldiers on active service, such as "Soldiers' Homes," some of which were splendid soldiers' institutes where refreshments were to be had cheaply, and which afforded opportunities for reading and for writing letters. We must not pass over the arrangements made for the washing of the soldiers' garments. Not merely was the soldiers' body-linen washed, but their clothes repaired, and in part replaced.

It would be most unjust to pass over the very prolonged occupation of the Swiss frontiers if we did not mention the exertions of the Swiss Red Cross Society. The Swiss Red Cross is managed usually by a board of directors. But at the very beginning of the mobilization (Aug. 2 1914) the Red Cross men were also called up, and a medical man placed at their head as chief. At that moment the Red Cross had at its disposal not quite £6,000. Hence it was resolved to organize a national collection, not merely for actual money, but also for gifts in kind (especially linen and woollen garments), and this idea was eagerly taken up. The money collected amounted to about £84,000, while the gifts in kind flowed in abundantly. As to the latter the Swiss women displayed great zeal. From all sides poured in shirts, socks, and other things, in huge quantities, including bed-linen and objects for use in hospitals. We must note the quaint fact that, over and above what is commonly used by soldiers on active service, many odd gifts were received, such as chemises for women, articles for female toilettes, and even children's toys.

If detailed figures were to be given for the useful objects collected from Aug. 1914 to June 1918 by the Swiss Red Cross Society, such as body-linen, shirts, sheets for beds, etc., the number would run up to several hundred thousands. The shirts, and the like, were specially welcomed by the poorer soldiers, who otherwise would have fallen victims to various diseases arising from the lack of such things, or in winter-time would have been frozen. For many, military service was thus rendered far more endurable.

One of the chief tasks which fell to the Swiss Red Cross was the creation of the so-called "Red Cross Squads." These were composed of men, exempt from military service, who placed themselves voluntarily at the disposition of the Red Cross, and were provided by it with uniforms and all things necessary for a regular "health service." The Red Cross Society itself has a great number of carriages at its disposal, and also sometimes commandeered motor-cars, and prepared them for the transport of the wounded. The troops on active service, like the Medical Corps, also used such vehicles in great numbers.

A further task of the Swiss Red Cross consisted in the training of well-qualified Red Cross women nurses (Red Cross sisters). Besides these there were other training establishments, either religious or lay (the latter are the mother houses which train nurses). At the very beginning of the war the Red Cross reckoned on the services of 960 sisters who could be employed in the care of sick soldiers. Many of these were employed in the huts for the wounded, set up at fixed distances behind the front, and in the military hospitals.

The Swiss army was severely tried by the influenza epidemic in the summer of 1918 and in the following winter, and that, too during the general strike (*see* below). If the Swiss Red Cross had had many claims upon it previously, it was now scarcely able to meet the tremendous demands made upon it, first, by the army leaders, and later on (at first the plague was contemptuously termed "the Spanish grippe") when the epidemic spread to a totally unexpected extent among the non-military population, and the unceasing cries for help from this side resounded louder and louder. As the epidemic spread more and more widely, voluntary help had to be enlisted. Here stepped in the so-called "Samaritan Associations" (St. John's Ambulance), already closely connected with the Red Cross, and encouraged their members, with a certain amount of training obtained in voluntary sick-nursing courses, to place themselves at the disposition of the afflicted families. The chief work, however, fell upon the Red Cross and its professional trained nurses, and it is amazing how much the Red Cross achieved in this department. About 10% of the professional nurses (sisters) died of their exertions.

In another respect too the Red Cross rendered excellent service. As is well known, the American Red Cross Society gave some £20,000 to the Swiss military nursing department. This sum was employed in creating convalescent homes for the Swiss soldiers who had suffered from influenza. The Swiss executive put this task also in the hands of the Swiss Red Cross, which, however, later on had to make considerable additions to this amount of money.

In consequence of the spread of the influenza epidemic it became necessary either to suspend or to delay the holding of the training courses for recruits, the subsequent drill courses, and the education of the non-commissioned officers. The percentage of invalid soldiers was unexpectedly high, and as the epidemic was so rapid as to seem like an explosion, it could be combated only with very insufficient means. Hence very caustic criticisms were expressed without reserve. These demanded publicly the dismissal of the chief of the medical department of the Swiss army, who was said to be already overweighted with the care of the "interned" foreign soldiers, and so could pay too little attention to his own Swiss soldiers, and had ordered precautionary measures at too late a period. All kinds of military hospitals, if one can credit the accounts in newspapers of all shades of opinion, presented a very sorry appearance. The care of the foreign interned soldiers was taken away from this Swiss chief medical officer, and also, after an enquiry, he was acquitted of want of attention to his own Swiss soldiers.

After the Armistice (Nov. 1918) the Swiss army could gradually be almost wholly demobilized. The defence of the frontiers was entrusted to volunteer troops whose pay was fixed at from 8 to 10 francs (6 to 8 shillings) a day. This afforded a decent income at least to many who no longer earned anything, whether because of the direct effects of the war or of the prolonged military service in their own land. It was asserted that in consequence of the prolonged mobilization the Swiss soldiers had gained immensely in military efficiency. But it was a pity that such efficiency cost the little land of Switzerland between 40 to 50 million pounds, and this expense had to be met by raising the customs duties, taxes on excess profits, two sets of special "war taxes," etc., which, it was hoped, would bring in the necessary funds, if only after a lapse of many years.

Once again considerable bodies of troops had to be called up because of the general strike (Nov. 1918), which failed in a few days. And these extra troops were required also by reason of the break-up of the German and, especially, the Austrian armies, which flowed back like a flood, and threatened a regular invasion of Switzerland.

In Nov. 1918 Gen. Wille resigned his post, as he considered that his work was at an end. In the same month the military pensions were increased 10% and the export of arms and ammunition forbidden, while the bureau of the Swiss general staff was also dissolved.

To meet the emergency support of the families of poor soldiers during the four years of the mobilization period nearly £2,000,000 were expended. Both for the mobilized soldiers and for the volunteers the daily pay was raised to about 7s. Before the war ordinary soldiers received only 8d. a day. The old arrangements were put into force again in March 1920.

The defence of the northern frontier had to be strengthened again at the time of the signature of the Peace of Versailles (June 1919), for a huge immigration from Germany was feared. Later, the frontier police had also to be strengthened because of the great amount of smuggling and the enormous number of people who crossed the frontier because of the bad conditions of life in central Europe and the lack of employment, for Switzerland, as the sole non-enemy land open, was regarded as an El Dorado. On Aug. 28 1920 the watch on the frontiers was definitely abolished. The strict watch on the frontiers had greatly impeded all facilities for travelling, and the very severe regulations as to the visa of passports and payment of other dues were subsequently greatly lightened.

Economic Effects of the War.—After the first excitement had died down, there were, in the first months of the first year of the war, no notable advances in the prices of various articles in Switzerland. This took place gradually, as the difficulties of importing articles increased. As early as Nov. 1914, Italy announced that she would place no hindrances in the way of the export of articles of food and supplies of raw materials.

In the matter of corn Switzerland was not in a very favourable position at the beginning of the war, for the supplies existing there would have barely sufficed for a couple of months. One must not forget that the Swiss agriculturists devote their attention far more to milk and cheese than to corn. This latter, therefore, could be delivered more cheaply by foreign countries, and was a far less profitable occupation for the Swiss farmer than milk and its products. Hence Switzerland fell more and more into a state of dependence on foreign countries.

The Swiss authorities naturally first of all attacked this pressing problem, and tried to find a remedy. They acted very shrewdly in that they introduced, Jan. 9 1915, a provisional monopoly of corn, and issued a special decree relating to its export. Thus the country was to a certain degree provided with the raw materials for bread and, above all, a bar was placed on all speculation in this most necessary article. Hence it was possible in the following month of May to note that the regular supply of corn was proceeding quietly, and that Switzerland was better supplied with corn than at the beginning of the war.

In the case of various articles such as bread and milk, a prohibition to export them was issued at once. It may cause surprise at first to be told that milk was included in such a prohibition. But whoever is aware of the fact that nearly all the milk, so far as it is not consumed within Switzerland, was worked up into various shapes (*e.g.* cheese, butter, condensed milk) and then was exported in great quantities, will not find fault with this prohibition, when he learns that in Switzerland itself there were periodical milk famines for the native consumers. And it came to pass that milk itself was exported from Switzerland. For example, in the frontier city of Basle, the inhabitants at the beginning of the war were forced to exchange milk for vegetables grown in Alsace, because for ages the supply of fresh vegetables for Basle had been supplied by Alsace alone.

When the war had lasted about a year, and no end to it was visible, the necessaries of life in Switzerland began to be not only more expensive, but also scarcer. In June 1915 it was therefore forbidden to export any articles of this kind. This regulation was due to the act of profiteers, who bought these necessaries of life in huge quantities, and then accumulated them for export to central Europe. Switzerland now found itself in a rather awkward position. If she forbade the export of necessaries of life, central Europe menaced the stoppage on their side of the import into Switzerland of the various articles which she most needed, such as coal, raw materials, artificial manure, etc. On the other hand, the Entente threatened Switzerland with a rationing of the consignments of necessaries of life in case the export of such to Germany and Austria were not entirely stopped, for the Entente had soon discovered that for central Europe this matter was the sorest point in its war administration.

In the course of wearisome negotiations with both parties the Swiss tried to find a satisfactory arrangement. So first they tried to found with Germany some sort of organization for imports. Industrial firms founded private import trusts, *e.g.* in Geneva, under the name of *Société auxiliaire du Commerce et de l'Industrie.* A similar trust was created in St. Gall, and in Basle a so-called "Import Trust Company." It became harder and harder to assure sufficient supplies for the whole country. The imports of necessaries of life from the "Free Zones" to Geneva were subject to strict supervision by France. On the heels of the corn monopoly of 1915 there followed in 1916 a monopoly of the importation of rice. In order to ascertain the amount of existing stocks of provisions within Switzerland the Swiss executive ordered a return of the supplies of such wares as were found in the entire country. As the supplies of necessaries of life became scarcer, so did the prices rise steadily.

The "S.S.S." (*i.e. Société suisse de Surveillance économique*), with its headquarters in Berne, had itself entered on the commercial registry. Complaints were made by important members of the general public that by this action the exports and imports were placed practically under the control of the Entente. It was, however, too easily forgotten that naturally it was not the intention of the Entente to permit an uncontrolled import to Switzerland, and then an uncontrolled export to central Europe, and so supply its enemies with the things they lacked. But the Swiss rightly argued that it was absolutely essential for them to keep up a certain exchange of commodities with central Europe. For instance, cattle in great numbers were exported to Germany and Austria-Hungary, whence coals, iron, steel, manure, sugar and other needful articles were imported into Switzerland.

It would have been far easier to supply Switzerland with all these goods, had a larger number of railway goods trucks been available. But many were away in foreign parts in order to collect the accumulated goods in foreign harbours, because neither France, Germany, nor Italy had any trucks available for the through journey to Switzerland. Often the trucks were delayed for months on the way, or were utilized by the belligerents for their own needs, so that quite often Switzerland had to make protests, and to claim the return of its trucks. Even in 1921 France was still refusing to pay the sum agreed on for Swiss trucks held up and utilized by her. In consequence of this insufficient supply of goods trucks the import of corn to Switzerland was at one time quite blocked, and this caused no little anxiety in that country. As the feeding of the Germans began to be more and more difficult, and the prisoners and evacuated persons had to suffer thereby, many good persons in the Entente lands caused bread to be baked in Switzerland, and then, with other articles, to be sent to Germany for the use of the Entente subjects interned there. Switzerland had nothing to urge against this proceeding so long as there were sufficient supplies for its own people. But later on the supply of wheat for this purpose had to be specially delivered by the Entente. In the same year (1915) a prohibition to export cotton was issued, and from Nov. 25 onwards cheese could not be sent away in quantities of more than 1½ lb., and licences to export butter were no longer granted.

It was in 1916 that the profiteers were most numerous and most active in Switzerland. In April the Swiss executive had to make new and sharper laws against the speculators who chose the necessaries of life as their field of operation. In Geneva a great organization was discovered which busied itself with such speculations. By order of the cantonal executive considerable supplies of coffee, cocoa, and chocolate were seized, and a number of foreigners expelled. Great quantities of rice and fat were also confiscated in Basle and in Buchs, on the Austrian frontier. One must assume, of course, that the greater portion of these goods had been smuggled over the frontier. Soldiers, customs officers, frontier guards had their hands full with countering the tricks of smugglers, speculators and profiteers.

Henceforward the economic relations began to get sharper and sharper. After the inquiry as to the existing stocks of sugar came the sugar monopoly. This had become necessary because the wholesale firms were no longer willing to undertake the importation of sugar. (Before the war Switzerland imported annually sugar to the value of about £1,500,000.)

As the blockade of the Central Powers by the Entente became more and more strict, this had a reflex action on the economical situation of Switzerland. That little country found itself hard pressed from all sides. In June 1916 Germany threatened the stoppage of all exchange of goods if Switzerland would not deliver those which had been stored on German account in Switzerland, and the Entente as firmly refused to let this threat be carried out. In the same month a Swiss delegation journeyed to Paris in order to remove these difficulties. But at first no settlement could be reached, for the Allies and Germany both obstinately clung to their points of view. Finally in Sept., with great trouble, an arrangement was concluded with Germany. Hardly was this in force when France, England, and Italy required that Switzerland apply to them measures similar to those which Switzerland had accepted in the Germano-Swiss arrangement. How complicated this situation often was for Switzerland is shown best by the Note, according to which the Entente required from Switzerland a prohibition for the export of all those manufactures (machines and parts of machines), the making of which required oil for greasing them which came from the Entente states. The distrust of Switzerland became greater and greater. Germany complained that Switzerland had abandoned its neutrality, and was under the protection of the Entente. On the other hand, the Allies grumbled that the goods delivered by them were handed over by Switzerland to the Central Powers. What wonder then that the saying became prevalent in Switzerland—"A neutral Power is kicked from the left, and whipped from the right."

The following fact will show how much during the war Switzerland had to depend on a reasonable amount of imports. In 1916, despite all the efforts of the Swiss farmers, only two-thirds of the supply needed for the country could be produced. Besides wheat for bread, raw materials, artificial manure, cattle for slaughter, fat, and by far the greater amount of the potatoes used, had to be imported from foreign parts (Germany, Holland and Italy). In 1916 Germany exported to Switzerland 1,600 trucks filled with potatoes, both for consumption and for sowing.

For foreigners it was not easy to understand why Switzerland placed the seizure of the harvest and the fixing of maximum prices for the most important necessaries of life in the hands of the Military Department, for in Switzerland, as in other lands, so-called official Food Departments had been set up. It was easier to understand that the military authorities were empowered to issue orders that the supplies of hay and straw of each harvest should be commandeered. Inquirers were informed that the Military Department or the Chief War Commissariat office had, in the course of years, accumulated a great stock of corn, which was renewed every three years. When, at the very beginning of the war (Aug. 27 1914) the Swiss executive sanctioned the grinding of "full flour" and then, as is well known, ordered a corn monopoly for the Confederation (Jan. 9 1915), and also commandeered the entire corn harvest, the Chief War Commissariat office was the right authority to carry these orders out. But on Aug. 1 1917 a central bureau for the provision of bread was set up, and on Aug. 10 1917 this was followed by a Swiss bread bureau. On Sept. 13 1918 a Swiss Provision Department was resolved on, and the bread matter was entrusted to it.

The entry of Italy into the war (May 23 1915) was a hard blow to Switzerland, making it more anxious than ever, but still worse was the declaration made by Germany (Feb. 1917) to the Allies of the unrestricted submarine warfare. By this step Germany won no sympathy from the neutrals, although the Swiss executive refused the suggestion of the United States to break off all diplomatic relations with Germany. The Swiss held that this refusal was in accordance with their neutrality, as Germany was the sole land which supplied coal to Switzerland, for the Entente had now to send coal to Italy and could not supply it to Switzerland. At any rate Switzerland got coal from Germany, despite increased prices, cheaper than Italy did from its Allies.

The declaration of Germany (on Feb. 1 1917) that the port of Cette lay outside the blockade zone was only a poor comfort for Switzerland. It ought to have secured previously a reasonable amount of imports. France strained its resources to satisfy the demands of Switzerland as far as it could, and sanctioned important traffic alleviations for the transport of necessaries of life. But this did not hinder the needs of Switzerland from being increased. On Feb. 12 1917 two "meatless" days per week were ordered, and on other days only a single dish of meat was allowed for each meal.

One misfortune followed another. Soon the Argentine Republic announced (April 1917) that it had forbidden the export of wheat,—even the supplies already bought by Switzerland.

However, it must not be thought that during this critical period Switzerland had simply folded its hands on its breast. It tried as far as possible to make itself independent of foreign countries by directing additional planting of potatoes, vegetables and materials for bread. Flowers disappeared from all gardens. Everywhere their place was taken by potatoes and other vegetables. The pleasure parks and drill grounds in and around the towns were commandeered for the same purposes. In the evenings, when the day's work was done, the workingmen of the towns were seen, pick and hoe in hand, busy turning up the ground which previously had served all purposes except the planting of useful things. The State ordered each parish to put gratis at the disposal of the poorer classes land for cultivation, and even swampy spots had in all haste to be prepared for cultivation. It is easy to understand that sometimes practical impossibilities were demanded. "One lives and learns." Next, after the land had been prepared for cultivation, suitable kinds of manure were no longer to be had. Those who were not owners of cattle could produce none. Artificial manure of good quality proved too dear to be purchased by poorer people. These were obstacles that must not be underestimated, but absolute need and the horrible period of the war overcame them all. Frequently the results of this compulsory planting did not even approximately reward the pains and work which had been bestowed upon it, but people were too filled with joy to despise the little that was actually the result. Thousands and thousands of families who previously did not produce necessaries of life had themselves to plant the amount of potatoes and vegetables required for their own use, and so considerably relieved the crying need. In 1917 120,000 trucks of potatoes were produced (the normal production was about 100,000 trucks). But there was no abundance of this commodity, for in many poorer families potatoes had to replace macaroni, and such like wares which had become more expensive.

These measures on the part of the Swiss authorities were indeed very drastic, but they could not have acted otherwise. The townsman, like the country farmer, was affected by them. The latter indeed had to submit to regulations which meant a revolution in his ordinary business. He was ordered, without the slightest regard to the number of his cattle, to plant a fixed quantity of his land in corn, in such and such a manner. With far less help than heretofore (for the men of military age were generally absent), the peasant women and their half-grown children had alone to do all the work. Not infrequently even their horses were taken away for service on the frontier.

When the peasants had planted, as ordered, the fixed quantity of land in corn, and so helped in the supply of bread, it turned out that now they had too little hay for their cattle. Experience taught here, as elsewhere, that an existing state of things could not be simply changed by the alteration of a screw in a machine. The aforesaid regulations reminded men of the State right of tutelage in the matter of dealings with corn, as had been usual in Switzerland as late as the 18th century. Great quantities of corn were procured and stored in granaries, in order to secure cheaper bread to the people in general.

The more profitable pasture business (*e.g.* breeding of cattle and milk industry) had developed from agriculture. Before the war there were big farmers in Switzerland, who only grew potatoes and other vegetables enough for their own use. But the rest of the land was laid down in grass. So it is easy to understand that before the war Switzerland could export yearly huge amounts of cheese, butter, and condensed milk.

Against the introduction of "bread cards" Switzerland fought with tooth and nail. The workingmen in the towns were not willing to be deprived of their unrestricted amount of bread. A middle way was therefore tried in Switzerland—the grinding of the corn less finely, and the prohibition of the sale of fresh baked bread (Feb. 12 1917). Further, in May, a decree directed that bread should only be sold 36 hours after it was baked. But already in Oct. the final solution of this problem could no longer be deferred—the daily ration of 9 oz. a head.

Bread and meal were joined on the same card. The bread card was split up into such small rations that the traveller could obtain in the hotels and restaurants per portion only 1½ ounces. This regulation was followed in Feb. 1917 by the order to make macaroni, etc., only out of eggs, and then on March 1 1917 appeared the cards for rice and sugar. In the case of sugar about 2¼ lb. extra were allowed per head for making jam.

Every month or two Switzerland had to start new negotiations with the belligerents, and to conclude new agreements. In May 1917, the negotiations about the management of the S.S.S. were brought to a conclusion, and an understanding was reached about the import of fodder and the export of live cattle. For the export of fodder from the Entente lands, Switzerland had had to export live cattle as "compensation." A new economic agreement between Germany and Switzerland was also concluded.

A special chapter in the provisioning of Switzerland was formed by the struggle about the price of milk. Here the consumers and the producers were often hotly opposed to each other. The workingmen in the towns reproached the peasants with illegal exploitation of the hard lot of the people, and that the latter often from time to time intentionally brought about a milk famine in order to drive prices still higher up. The "Town Associations" (a product of the war as against the country) took an active part, though not always with the same arguments, in this struggle against the peasants. These, on their side, refused absolutely, seeing that all kinds of fodder were always becoming dearer, and by reason of the general rise in prices, to supply their wares at the same fixed price. It was not always easy for the authorities in case of these quarrels to hit on a middle way which was good for all parties alike. One reason for the scarcity of milk was certainly that Switzerland temporarily exported many head of cattle, and this business wasted much milk. Then again, as butter and cheese rose in price, greater supplies of these articles were manufactured, as it was the more profitable business. All this took place, be it well understood, at the expense of the consumer, who had to suffer much thereby.

In order to assure nevertheless a sufficient supply of milk for the Swiss people in general, the Swiss executive empowered the Agricultural Department to fix the amount of the milk rations allowed to each parish, and sanctioned the delivery of milk at reduced prices to persons of small means. The maximum price for a litre (1¾ pt.) of milk was therefore fixed at 33 centimes (about 3½d.) in April 1917, but for people without means at 26 centimes (about 2½d.). The State and the parishes had between them to make up the deficiency. In order to create a closer organization and to render the commerce in milk somewhat the same for all 22 cantons, a central bureau for the supply of milk and its products in Switzerland was set up in Aug. 1917. It was empowered to issue decrees, and to subject the whole industry to Federal control. That was quite necessary, because it happened that the milk for the inhabitants of the towns was already rationed (so in Berne on Jan. 1 1918 the daily allowance a head was only three-fifths of a litre), while in the country free trade prevailed in this business. As the danger of a fresh rise in the price of milk became more and more imminent, the town workmen opposed it vigorously. They threatened a general strike if this most essential commodity should be again raised in price. In the Chamber of Deputies of the Swiss Parliament a compromise was made on this basis—the Swiss executive to grant one rappen (less than a farthing) per litre to the milk producers, and to pay the extra expenses of the transport—this was only to avoid a fresh rise in the price of milk (Oct. 1917). This was well meant, but it turned out later to have been a mistake, since from this time onwards rich and poor profited by this arrangement, and the Swiss authorities had to pay out a huge amount of money.

For the time certain kinds of cheese (cream cheeses, etc.) were not allowed to be sold, and the consumption of butter was restricted. Finally, it was arranged that each landowner was obliged to deliver a fixed quantity of milk from each cow for consumption. When later in 1918–9 the rationing was still more limited (Oct., half a litre, and in Nov. one-third litre per head) this evil was not so much due to any intentional over-production of milk products by the peasants, but, as pointed out above, because many peasants by reason of the compulsory planting of corn, and dearer hay, etc., and the consequent hay famine, could afford only to keep a far smaller number of cattle. This circumstance may have affected the production of milk more than was stated above. It must be added that children up to a fixed age and persons over 60 could claim an extra ration—so too sick persons, but for these a medical certificate was necessary.

At the beginning of the war people were much perturbed by the payment of 26 rappen (about ¼ of a franc) for a litre of milk, and yet in 1921 the price was 52 rappen (about ½ franc), or an increase of 100 per cent. After the conclusion of peace and on the return of more normal economic conditions it was hoped that a slight alleviation would ensue. But in 1919–20 the foot-and-mouth disease in Switzerland increased to such a degree that at the end of 1919 the daily ration of milk in the towns sank to below the average in the war-time—to one-third of a litre. The foot-and-mouth disease caused Switzerland a loss of about £5,500,000. Finally, in April 1920 this limitation was abolished. The milk famine was one of the greatest calamities that occurred in Switzerland during the entire war period.

It goes without saying that macaroni, groats and oatmeal, barley, cheese, butter, fat, and oils were all rationed, and even also, in part, potatoes and coals. The supervision took place by means of specially issued cards. The butt of the card had to be given up every month when new cards had to be procured. These bore every month differently coloured signs of authenticity. A regulation was also made that in each household even necessaries of life, which were *not* rationed, should not be kept in quantities exceeding the supply required for two weeks.

Some necessaries of life were meted out with a very sparing hand: thus only rather over 1 lb. of meal per head and per month was sanctioned, while, from Oct. 1917, white meal and groats were only allowed for hospitals and sick persons, and, even to procure these, corresponding bits of the bread and meal card had to be sacrificed. Other important necessaries of life were rationed as follows: maize about 14 oz., rice about 9 oz., and sugar about 20 oz.—in each case per head and per month. But even these rations were not fixed fast—on the contrary they were raised or lowered according to the existing supplies imported.

The restrictions that were most felt were those on butter and on fat for cooking. Foreign lard, even before the outbreak of the war, had been imported in great quantities. But afterwards the imports of this article fell off more and more—in July 1917 it had decreased by 90 per cent. Hence the supervision of all kinds of fat was placed under State control, and in Jan. 1918 a so-called "Central Bureau for Fat" was set up to ensure the provisioning of the country with fat and oil, both for eating. The fat and butter cards (fat for eating and oils) were brought in on March 1 1918. They allowed about 12 oz. of fat and about 5 oz. of butter per person each month. In June the ration of butter fell to about 3½ oz., and then rose again to about 9 oz. After the Swiss Government succeeded in buying in America (Jan. 1919) 15,000 tons of pigs' fat, it became possible to abolish the rationing of fat in July of the same year, but the butter cards remained in use for two months longer.

About the same time (July 1919) the rationing of macaroni, groats, oatmeal, and barley was abolished, and two months later (Sept.) the same was done with the bread and meal cards, and finally with the "meatless" days.

For the poorer classes so-called "Distress Relief" was organized, *i.e.* the Confederation, the cantons, and the parishes together paid over to these poorer people a portion of the price of certain necessaries of life. The principal objects of this charity were bread, milk, and potatoes. In the towns many classes of the population had to be supported in this manner—in the town of Berne alone about 27%. In the summer of 1918 the increase in the prices of necessaries of life rose to 120%, and in the autumn of the same year to 150%. Throughout the country the town workmen organized demonstrations against this increasing cost of necessaries, and these were combined with other matters of political discontent, these latter being stimulated by the events in Russia and in Germany and all leading up in Nov. to the general strike (*see* below).

Manufacturers in general accommodated themselves quickly to the state of things produced by the war. An exception was formed by the embroidery industry of eastern Switzerland, which was paralyzed through insufficient exportation and lack of foreign orders. On the other hand, the watch factories did very well, because they could manufacture parts of ammunition for the belligerents, which brought in much money, both to masters and men. The same thing happened with the great industrial magnates, who manufactured turning lathes, machines or parts of machines for the same object, and exported them. The delivery of completely manufactured ammunition was forbidden by the Swiss executive as being contrary to neutrality, but it was not difficult to get round this prohibition. Each of the belligerents sought to arrange matters to its advantage. Germany once claimed that every manufacturer of western Switzerland who delivered articles to the Entente should receive no more German coal for his factories. France, on the other hand, forbade the use of grease for machines and parts of machines which were to be exported to Germany. It was not always easy for Switzerland to steer the right course, without totally depriving its workmen of their wages.

The provisioning of Switzerland with coal proved often a very difficult and complicated matter. At the beginning of the war, and in part even up to the year 1916, it was not possible to complain in Switzerland of a coal famine, properly speaking, for the prices had risen by not quite a quarter per ton. Before the war one had to pay to the coal merchant (including his profits) about £2. 8s. per ton, and in 1916 some 7s. or 8s. more. But matters changed altogether in 1917, for not only did the price (including the profits of the coal merchant) rise to £5. 4s. but restrictive measures were taken. By a decree of the Swiss executive of March 7 1917, no one was allowed to procure a supply of provisions sufficient for over three months. In Basle the so-called "Central Bureau for Coal" was set up. Any person who required more than five tons of German coal had to take a share in the aforesaid company, or else to pay an extra £2 per ton. The object was to secure to Germany an adequate money advance, probably in order to compensate her for the loss on the exchange. Germany was required to provide solvent guarantors, so as to make sure that the money would be forthcoming. Later on, a local "Coal Supply Bureau" was set up in every town and every parish, which fixed the amount that any person could be allowed, and supervised the distribution. The prices for good coal (including merchants' profits) amounted to £10 per ton. New restrictions were often issued. The census of the amount of coal was soon followed by its rationing. It is well known that Switzerland, apart from peat and some slate coal, possesses no coal proper. That fact suffices to prove how dependent she is in this respect on foreign supplies. A "Swiss Coal Co." was formed, the object of which was to support financially efforts to find more coal in the country. Researches were carried on all over the land, and a certain amount of coal of poorish quality was found in the cantons of Berne and of the Valais. Peat too was cut, wherever there was a possibility of the smallest supply. But one cannot be surprised that, despite the high prices, the quantity of this coal fell far short of the amount required.

Soon after the scarcity of coal began, and particularly by reason of the rise in its price, the railways and the steamboats on the Swiss lakes were forced not only to raise their fares, but to take other restrictive measures. First of all the "excursion tickets" were suppressed, and then also the cheaper sorts of return tickets abolished (1917). The circulation of trains was reduced from March 1 1918 by a third. In Nov. 1918 the State railways raised their tariff for goods by about 80%, and in the same month experiments were made with supplying locomotives with wood instead of coal, and this, in consequence of the ever-increasing coal famine, even in the case of fast trains. The cantons were each bound to deliver a certain quantity of wood, according to their size and their supplies. Canton Berne, in particular, had to furnish very large quantities of beech wood. Previously, the whole supply of fuel had been seized by the State. All public bureaux and post-offices had to reduce the hours during which they were open, schools had to have holidays, etc. One restricted railway scheme appeared after another, and from Dec. 1 the circulation of travellers, on those bits of the railways which were still run by steam, was provisionally entirely suspended on Sundays and festivals. The only trains allowed on those days were those which carried milk. At the same time the distribution of letters on Sundays was discontinued.

In this time of need strenuous attempts were made by the Swiss authorities to electrify the railway lines, where this could be done most efficaciously. The private non-State railways were encouraged to do the same, and subsidies were promised to them for that purpose. Although, with certain exceptions, such as the St. Gotthard line and some smaller bits, this permission could not be utilized to the extent required, this is to be explained by the unheard-of prices asked for raw materials. The purchase of electrical machines alone absorbed such huge sums that the necessary capital could not be brought together.

In Oct. 1920 a fall in the price of coal took place, and the supply also gradually became better than heretofore, so that in the winter of 1920–1 the rationing of coal was abolished. The coal supply organization in Basle was wound up. But now another difficulty appeared. In consequence of the augmented supply the "Central Bureau for Coal" had acquired great quantities of coal at prices which were still high. Likewise the supply of peat had increased in amount. But as the coal prices sank the supply could not keep pace with the reduction in prices unless at a great loss. Business men complained that they could get coal direct from the pits at lower prices than those payable in Switzerland. The Swiss executive resolved to give financial aid for the distribution of the existing stocks in the country at cheaper prices. But it imposed on each ton of imported coal an extra customs duty, and this measure was to last until this advance was reimbursed.

Treaties.—In order to complete the picture of the economic difficulties which existed in Switzerland during the war we must here add a short account of the treaties which she was compelled to conclude with the belligerents.

The "S.S.S." (*Société suisse de Surveillance économique*), intended to regulate the circulation and employment of wares in the interest of the Entente, was founded on Oct. 11 1915. At the same time the "Treuhandstelle" for commerce with the Central Powers came into existence.

On Sept. 2 1916 the so-called Economic Agreement was concluded to facilitate the exchange of goods. Germany by this had to release per month 253,000 tons of coal, and the amount of iron and steel required by Switzerland. Switzerland, on the other hand, handed over products of milk, meat, etc. A Swiss export committee looked after the export of war supplies, produced with German raw materials (the so-called "Swiss Central Iron Bureau"). It was forbidden to use German iron or German coal for the production of war supplies destined for the Entente.

On Aug. 20 1917 a new arrangement was made. Germany was to grant permission to export 200,000 tons of coal at £3. 12s. a ton, and 19,000 tons of iron and steel, in both cases per month. On its side, Switzerland was to grant Germany a credit per month of £800,000 (foundation of the "Central Bureau for Coal").

On Sept. 29 1917 this arrangement was followed at once by a similar agreement with France. A group of Swiss banks granted to a group of French banks a credit per month of £500,000, this to last from October to December. In return Switzerland obtained from France certain economic reliefs. After two months this arrangement was renewed for 10 months, the credits allowed rising with certain improvements in the import of goods. On March 20 1918 a similar credit was granted to a group of English banks, the monthly maximum amount being fixed at £400,000.

On Aug. 30 1917 an agreement with France and Italy was concluded for the export of wood, to be worked up, from Switzerland. On Dec. 5 1917 the United States also made an agreement to supply 240,000 tons of bread-stuffs, till the next harvest. Other kinds of goods were "contingented." The lack of room on ships delayed, however, the delivery of these supplies very much. In place of the agreement with Germany (which had run out) a new treaty, much less favourable, was concluded (May 15 1918). Germany was bound to give leave for the export of 200,000 tons of coal, iron, and steel. The Swiss "Treuhandstelle" had to superintend the exchange of goods according to the S.S.S. system.

The Economic Agreement of May 5 1915 with Italy was still in existence. But on Nov. 1 1918 an economic and financial treaty was made with this country, as also with France and England. The credit to be allowed every month was fixed at a maximum of £200,000, but the amount of imports was limited.

In order to execute all these financial obligations of Switzerland the "Swiss Financial Association" was founded in Lucerne on Aug. 1 1918. To protect itself against the imminent danger of a maritime blockade, Switzerland agreed with Germany on April 24 1918 that free passage should be given for all cargoes destined for Switzerland.

In a fresh financial agreement with France (July 19 1919) Switzerland obtained a credit of about £1,250,000. The economic treaty with this country ran from March 25 1919 to the end of 1919. In Oct. and Nov. of that year the contingents of Switzerland for watches and embroideries were somewhat raised. In a fresh agreement of March 10 1920 a bargain was made with Switzerland for the delivery of 10,000 tons of coal (brown coal) from the pits on the left bank of the Rhine each month. Switzerland had to supply, among other things, electric power, but the promised amount of manure received by Switzerland was quite insufficient.

At the end of Nov. 1919 a new compensation treaty was made with Italy about the delivery of oil-cake and hay in exchange for cattle, for breeding and use.

The coal agreements came to an end in the beginning of 1919.

On Jan. 22 1919 an economic treaty was made with the United States; bigger contingents of goods were secured to Switzerland and a tonnage of 70,000 (soon raised to 100,000), England and France guaranteeing these amounts.

On March 25 1919 yet a new agreement was made with France about the supply of goods. France promised to deliver 60,000 tons of coal from Lorraine per month (at £4. 16s. a ton) and also manure and facilities for the transport of goods. On its side Switzerland engaged to deliver cattle for breeding and certain goods (chocolate, watches, embroideries, etc.) to the value of about £108,000 per month, and also a new credit not to exceed about £1,500,000 at the most.

The credit arrangement with England of March 20 1919 was not renewed. Later on, England too raised the contingents which could be imported, and sanctioned (March 1 1919) again the admittance of embroideries and silken goods. On April 28 1919 the "black lists" were abolished, and also the certificates of nationality and the contingents of imports permitted by the S.S.S.

Such were the economic agreements which Switzerland had to sign. Her economic dependence on foreign countries is thus abundantly clear, and yet it must be said that all the belligerents had taken much kindly notice of her position in this way or in another. It must be recognized that the Swiss authorities managed to get well through all their difficulties, and did not fail to take precautionary measures (sometimes very incisive) to provide the Swiss with all the necessaries of life. But, in consequence of the incredible rise in prices and the excessive prices of necessaries of life, even of those which are most indispensable, they were unable to bring it about that the distress of the people should not lead to dissatisfaction, complaints, and great discontent.

General Strike of Nov. 12 1918.—The Swiss Socialists (or Social Democratic party) were never stronger, and to a certain degree more feared, than towards the end of the fourth year of the war. The rise in prices of all commodities, and too the unforeseen and the previously unknown dearth of dwelling houses, were utilized very cleverly and ably for the purposes of propaganda, and brought great reinforcements to the Socialists. Protest meetings against too high prices were organized, and these were sometimes accompanied by political demands which caused serious restlessness. The revolution that had broken out in Russia in the preceding year and the break-up (Oct. 1918) of Germany, from the military point of view, and in part also from the political point of view, hurled their waves of revolt as far as Switzerland. Here the leaders of the workmen imagined that the moment was come for violent action. The crisis was the summoning of troops to Zürich, the Government of which on occasion of the memorial day (organized by the Socialists) of the Russian Revolution, feared serious riots. The calling of the troops to Zürich was considered by the workmen as a provocation, and the reply was a general strike for 24 hours, which very soon developed into an unrestricted general strike in the whole of Switzerland. The railways ceased to run, and in most Swiss towns the entire body of workmen took a holiday, though not in the rural districts or in western Switzerland where the strike was sometimes only a partial cessation of work, and ended in a speedy breakdown. In order to make this general strike more popular with the workmen the so-called "Olten Committtee of Action" put forth a social and political programme, which was submitted for speedy acceptance to the authorities, and included the following demands. The immediate transformation of the Government of the country so as to be in accordance with the will of the people. The new Government was to bind itself to the following programme at the very least; new election of the "Conseil National" according to the principles of proportional representation; voting rights of all kinds for women; introduction of the general obligation to work, and of the 48-hour week in all public offices and private businesses; the reorganization of the army so as to make it the army of the people; the securing of the supplies of necessaries of life, this provision to be carried out with the agreement of the rural producers; insurance for old and sick persons; State monopoly of imports and exports; and redemption of all State debts by the rich.

The Swiss executive refused to negotiate with the strikers, and the peasants made a show of cutting off the milk supplies of the towns. Another hope too of the strike leaders failed. They had expected that the soldiers, especially the members of the association of the "League of Soldiers" (thought to be imbued with revolutionary ideas and later forbidden by Gen. Wille), would naturally refuse military obedience. The military authorities, however, had taken the precaution to summon trusty troops from the rural and Alpine regions, and so the leaders of the strike saw their hopes falsified. When the news spread of the ultimatum issued by the Swiss executive to end the strike at once, otherwise the strike leaders would run the risk of being put into prison, the general strike came to a natural end. Such a strike has seldom broken down more wretchedly. The 48 signers of the "Olten Appeal" were accused of instigating the strikers to mutiny, and so were handed over to the military authorities for examination. By this accusation was meant any appeal which directly or indirectly was made to the soldiers, with the warning not to march against their own brothers, and not to turn their weapons against the workmen, but, in case such a command should be given, rather to refuse military obedience. By far the greater number of the 48 signers were acquitted. Only a few of the most prominent and the most compromised leaders were kept, and received punishments ranging up to six months' imprisonment. Here, as elsewhere, it became clear that the greater part of the Swiss workmen never would approve a united general strike with purely political aims.

Interned Prisoners.—As early as Oct. 1914, a beginning was made with the dispatch of the evacuated civilians home to France, Germany, and Austria, passing through Switzerland. And up to March 5 1916 some 60,000 persons were conveyed back to France alone by the same route.

On Feb. 21 1916 an arrangement was finally made about the exchange of the severely wounded German and French prisoners who were to pass through Switzerland. After the consent of the Swiss Red Cross had been previously obtained, this duty was confided to it by a decree of the Swiss executive. Now began the foreign action of that institute which lasted for five long years. Constance and Lyons were fixed on as the exchange centres; the trains were to pass through Switzerland at night, and the railway carriages required were to be furnished by the State railways.

Before the actual transport took place, "selection committees" visited the various prisoners' camps, in order to inspect the severely wounded men, and to settle which should be included in the exchange. The Swiss Red Cross agreed to defray all the expenses for the food, etc., of these poor men, and their nurses etc., but not the railway fares.

Besides the medical men, male Red Cross nurses accompanied the trains, sometimes also soldier nurses, while women nurses from nearly every Swiss nursing home looked after the invalids. The journeys took place at longer or shorter intervals, but often there were lengthy breaks, due to the state of the war, and to difficulties that arose between the hostile states.

The Swiss people took a great and a very sympathetic share in these transport trains. People flocked from long distances to the railway stations merely to see the trains rush past, and had the feeling that thereby they had showed their sympathy with the unfortunate victims of the war. At the places where the trains halted, the joy was enormous. At some spots the trains had to stop because the people would block them by standing on the rails, and a huge quantity of loving gifts, for which room was scarcely found, literally overflowed the Red Cross carriages.

The good example of France, Belgium, and Germany was followed in Nov. 1916 by Italy and Austria also. The exchange stations here were Como-Monza and Feldkirch-Dornbirn, and many trains came through with Austrians, Bulgarians, Turks, Serbs, English, and Italians. Later on, when Austria resolved to repatriate the numerous Italian consumptives, whose illness was still in the preliminary stages, special consumptive trains became also necessary. Imbecile soldiers were transported in great numbers. Twice trains, with many such, came through, and no one could determine their names or their homes.

A most pitiful and moving spectacle was the sight of the trains filled with evacuated civilian travellers. Old men with snow-white hair, women of all ages, and children, even unweaned infants, were seen in these trains. These unfortunate persons were warmly welcomed and well fed, in the most hospitable fashion. It is a gloomy chapter in the history of the war.

The interned soldiers were mostly housed in the Alpine regions. This took place for various reasons. First of all, the high air was looked upon as a great factor in their convalescence, and then again they were isolated from the temptations of bigger places and towns, and, finally, in the tourist centres many hotels stood empty, all ready to receive this new kind of guest, and well fitted to shelter great bodies of interned.

No Swiss industry was so hard hit by the war in its very existence as the Swiss tourist traffic, once so flourishing. According to the statisticians, milliards of francs were invested therein, and so, soon after the outbreak of the war, special measures of protection (such as exemption from bankruptcy suits) and also acts of charity had to be taken. What wonder then that the Swiss authorities, by this action in favour of the interned, hoped to kill two birds with one stone, and appropriate these small profits to the stricken *industrie des étrangers?*

The daily sum paid for accommodation, etc., per head was originally four francs, later five francs, and even in 1921 an extra amount of one franc daily per head for 1918 was the subject of negotiation. (These sums were paid by the respective states concerned.) But no state, save defeated Germany, had agreed up to June 1921 to this extra expense. The food was simple and nourishing, and in some places it was more than good.

At the beginning of the period of internment the interned were given free postage for all letters sent to their native countries. And nothing too was charged for parcels sent thence to foreign countries. This humane arrangement was afterwards first restricted, and later on quite suppressed, as the war seemed to be never ending, and the cost to the Swiss post-office ran up to £2,000,000, and even more.

A great difficulty arose as to the employment of the interned. In some places they took to an industry which promised them certain profits. Such were the beautiful, and even most artistic works of art which were produced by simple and untrained soldiers. They acted as joiners, mechanics, turners, wove baskets, made ropes, and nets, painted pictures, etc. In Thun, as early as 1916, a school of commerce was opened for the interned. The universities of Basle, Berne, Geneva, Lausanne, and Zürich allowed interned to matriculate as students. The Bernese University Committee provided in 42 prisoners' camps outside Switzerland both teachers and students with money, food of various kinds, clothing and books. The interned were permitted to hold exhibitions of their products, and special committees were founded to promote the sale of the fruits of their labour. Now and then they received visits from high-placed countrymen (such as Gen. Pau, etc.). They looked after their social amusements themselves. One English committee even got together money for the visits of English women to their husbands interned in Switzerland. The English interned enjoyed the special sympathy of the Swiss. The number of prisoners interned in Switzerland was already in Aug. 1916, 18,936—11,823 French, 4,322 Germans, 1,607 Belgians, 1,183 English, and one Austrian. These numbers later increased very much, and finally, when difficulties arose about food in Switzerland, it could not possibly receive an unrestricted number, and so after a certain time the interned were exchanged for others.

When the internment of wounded prisoners was resolved on in Switzerland this business was entrusted to the chief army medical officer, and the Swiss Red Cross. Practically, the Red Cross took charge only of the transport of the interned to and from Switzerland, everything else being supplied by the army authorities. The interned had fewer invalids than the exchanged prisoners, and so required only ordinary trains with occasional carriages in which to lie down; but many persons seriously ill were sent home, and the Swiss Red Cross looked after all such cases.

After the Armistice the principal transport of the prisoners belonging to the Entente took its start. The sick and invalids were partly sent for in special "sanitary" trains,—French, English, American, and Italian,—the nurses, etc., being supplied by the Swiss Red Cross. All these journeys passed off without any serious accidents, at least it never happened that any one was injured, though the trains went at express speed.

The Swiss Red Cross spent (apart from the railway fares) some £13,000 in carrying out this transport. No fewer than 81,377 persons were conveyed by the Swiss Red Cross, and that without counting the numerous civilians interned and civilians evacuated, who had previously passed through Switzerland, the number of these amounting to several hundred thousands. All these persons travelled through Switzerland.

In April 1919 there were still 5,000 Germans interned in Switzerland. These could only be sent home later, shortly before the home-coming of the prisoners interned in France.

The international action of the Swiss Red Cross extended also to investigations as to prisoners and missing soldiers. From all parts enquiries arrived, relating to the whereabouts of various soldiers. This was a task which properly belonged to the International Committee at Geneva, specially created for this purpose. In many cases, however, the Swiss Red Cross, thanks to its fortunate and useful communications by reason of the exchange of the interned, could answer these enquiries. With this object a special office was set up in Berne for the interned prisoners of war in Switzerland, and to this all enquiries were to be addressed, whether for interned persons or missing persons.

International Red Cross at Geneva.—The following was the share of this well-known institution. When hatred and reprisals on both sides got the upper hand, it issued a series of appeals, first of all in favour of common action in carrying out the task of the Red Cross, next to the belligerents on behalf of the wounded and sick, of the nursing staff, of their supplying necessary wants in accordance with the Convention of Geneva, and of the Hague Convention. Next came protests against the torpedoing of hospital ships and against the bombardment of hospitals on the field, the protection of Red Cross unions, the recognition of the Red Crescent, as to the treatment of prisoners, and the distribution of money collected (about £13,000) to the Red Cross associations of the belligerents, as to the reception of Red Cross sisters in Switzerland for rest and refreshment, missions to visit camps of sick prisoners in Italy, Bulgaria, etc., and prisoners' camps in general, the facilitating of communications between the Red Cross associations of the several belligerents, in favour of the sending home certain categories of war prisoners, against the propaganda bureaux, and against the employment of poisonous gas, etc. That is only an imperfect list of the tasks which the International Red Cross undertook, and which it would take a book to describe in detail. Its influence was not less blessed than that of the Swiss Red Cross, and was of extreme importance for facilitating communications between the belligerents. It is worth mentioning that the French poet, Romain Rolland, gave half the proceeds of his Nobel prize to Gustave Ador, the president of the International Red Cross in Geneva, for the war prisoners.

Help Given to Other Nations.—As early as June 28 1915, Switzerland hearkened to the cry of distress from little Luxemburg, then occupied by the Germans, and sent flour to help its suffering population. On Oct. 6 of the same year the Luxemburg Minister of State, von Eyschen, came to Berne to arrange for the supply of the necessaries of life to his country through the Swiss "Import Trust." The principality of Liechtenstein was supplied also with food-stuffs; this led to its closer association with Switzerland, and in 1921 it had Swiss postage stamps and used francs as money. On Dec. 4 1918, shortly after the Armistice, Switzerland, in order to alleviate the hunger in the German districts of Austria, sent ten trucks, laden with flour, and nine with rice, to Innsbruck. These supplies were reimbursed by the Entente, as also were the 100 trucks of necessaries of life sent on the 27th of the same month. Switzerland was selected as being able to send supplies quickly. Later, she sent them from the stocks meant for her own consumption.

But this kind of help was not the only sign of sympathy shown by Switzerland. When the need increased it extended its charity to the reception of badly nourished children belonging to the belligerent states. In Sept. 1916, 760 Belgian children from the occupied territory were long in the canton of Fribourg. In other Swiss cantons such poor children were also received. In the year 1919 alone a total of 43,000 foreign children was received in order to recover from illness. It were principally Belgian, Austrian, and German children who benefited by this act of charity.

Obituary, 1910–21.—Death was especially busy with the great Swiss historians during the decade 1910–20. J. Dierauer (1842–1920); W. Oechsli (1851–1919); Karl Dändliker (1849–1910); B. van Muyden (1852–1912) passed away, as well as Jakob Heierli (1853–1912), the principal authority on prehistoric Switzerland; Adolf Wäber (1841–1913), the bibliographer of works of travel in Switzerland; Caspar Decurtins (1855–1916), the great authority on the Romansch dialect; Jean Grellet (1852–1918), the well-known writer on Swiss heraldry; Emilio Motta (1857–1920), the founder and also the editor (for 35 years) of the *Bollettino della Svizzera Italiana*, which rendered such great service for the history of Italian-speaking Switzerland; and Henri Fazy (1842–1920).

The fine arts also mourned the loss of Ferdinand Hodler (1853–1918), the merits of whose pictures were so hotly discussed during his lifetime; Max Buri (1868–1915), the delineator of Bernese peasant life; and Eugène Burnand (1850–1921). To these losses we must add Richard Kissling (1848–1919), the famous sculptor; and J. R. Rahn (1841–1912), the historian of Swiss art.

Other Swiss, each eminent in his own way were Theodor Kocher (1841–1917), the world-famous surgeon; F. Imhoof-Blumer (1838–1920), the celebrated numismatist; F. A. Forel (1841–1912), the physicist and monographer of the Lake of Geneva; Johannes Coaz (1822–1918), the great authority on Swiss forestry, and a mountain climber whose active career ended in 1850; J. H. Graf (1852–1918), the mathematician and leading authority on old Swiss cartography; and, last but not least, J. H. Dunant (1828–1910), the founder of the International Society of the Red Cross at Geneva.

We must not omit a group of men of letters of the "Suisse Romande"—Gaspard Vallette (1865–1911) and Philippe Monnier (1864–1911); and the novelist Edouard Rod (1859–1910).

Our list may be brought to a close with the names of the linguist, Ferdinand de Saussure (1857–1913); and of the Romance scholar, Heinrich Morf (1854–1921).

Miscellaneous.—Perhaps the most important event which happened in Switzerland in 1920 was the first meeting of the League of Nations in Geneva, a spot selected, it is said, by President Wilson. In Feb. 1921 Switzerland declined to allow the passage of police troops to guard the peace in the Vilna popular vote.

Switzerland has adopted officially the day of 24 hours, running from midnight to midnight.

Naturally, the possibility of winter sports in Switzerland was excluded (save for the natives) during the war, and they had not quite reached their former vogue even by 1921.

The long war had a most disastrous effect on the Swiss hotel industry. Previously to it far too many big hotels had been built, so that the whole industry was overcapitalized and in a state of great indebtedness to the banks. After the end of the war many hotels were pulled down or diverted to other uses, even in such frequented spots as Interlaken and Grindelwald. It has been stated by H. Gurtner that the total capital invested in the Swiss hotel business was in 1912 about £45,500,000, or about one-thirtieth of the total amount of the wealth of Switzerland. The same writer puts the total value of the hotels in the Bernese Oberland at about £6,000,000 just before the outbreak of the war.

On May 15 1914 a great national exhibition was opened at Berne. But the speedy outbreak of the war nearly ruined it.

The rate of exchange on London varied much during the war. After the first shock it rose to over 26 francs (par 25), but then sank, and attained its lowest point in June 1918, with 18·83$\frac{1}{3}$. It subsequently recovered somewhat, but in Aug. 1921 it stood only at 21·64. Of course this involved great losses for English residents and travellers, while the better value, obtained both in France and Italy, drew many to those lands.

BIBLIOGRAPHY, 1909–21.—In 1910 the 6th and final volume of the *Dictionnaire Géographique de la Suisse* (the first appeared in 1902) was issued at Neuchâtel, while in 1918 the same publishers began the publication of the *Dictionnaire Historique et Biographique de la Suisse*. (Both publications are issued in French and German.) H. Barth gave to the world in 1914–5 the three vols. (going down to the end of 1913) of his marvellous *Bibliographie der Schweizer Geschichte*. In the domain of constitutional history we have a new and revised edition (1914) of W. Burckhardt's *Kommentar der schweiz. Bundesverfassung von 1874*; A. Heusler, *Schweiz. Verfassungsgeschichte*; E. His, *Geschichte des neueren Schweiz. Staatsrechts 1798–1848* (vol. i. 1920); and W. Raustein, *Die schweiz. Halbkantone* (1912). For very early Swiss history we have A. Schenk, *La Suisse Préhistorique* (1912); P.E. Martin, *Études critiques sur la Suisse à l'Époque mérovingienne, 554–715* (1910); and Marius Besson (now the Bishop of Lausanne and Geneva), *L'Art barbare dans l'ancien diocèse de Lausanne* (1909).

The very best detailed history of the Swiss Confederation is that by J. Dierauer, entitled *Geschichte der Schweiz. Eidgenossenschaft*, now complete in five vols. and published at Gotha (vols. i and ii., 2nd. ed., 1913; vol. iii., 1907; vol. iv., 1912; and vol. v., 1917) which brings the tale down to 1848;—a continuation is in preparation—there is also a French translation. E. Gagliardi, *Geschichte der Schweiz* (2 vols., 1920), is a new general Swiss history.

An important episode in Swiss history is narrated by E. Gagliardi, *Der Anteil der Schweizer an den italienischen Kriegen, 1494–1516* (vol. i., 1494–1509, 1919). Marie Louise Herkin's life of *C. V. Bonstetten, 1745–1832* (1920) is a contribution to Swiss literary history of the 18th century. W. Oechsli's *Geschichte der Schweiz im 19ten Jahrhundert*, from 1798 (vol. ii. appeared at Leipzig in 1913, the work will be continued by E. Gagliardi), and J. Winiger's life of *Josef Zemp, 1834–1908* (1908), like E. Deriaz's *Un Homme d'État vaudois, Henri Druey, 1799–1855* (1920), and T. Weiss' life of *Jacob Stämpfli, 1820–1879* (1920), relate to modern Swiss history. In 1918 W. Oechsli published at Zürich a new edition of his *Quellenbuch zur Schweizergeschichte.*

In geology we have to note A. Heim, *Geologie der Schweiz* (appearing since 1919 in parts at Leipzig). In the domain of the fine arts vol. iii. of the *Schweiz. Künstler-Lexikon* appeared in 1913, as did an extensive supplement to the work. The special works by J. Scheuber, *Die mittelalterlichen Chorstühle in der Schweiz* (1910) and by E. A. Stuckelberg, *Cicerone im Tessin* (1918) are also very useful works in this department.

In ecclesiastical history we have the fine monograph, *Angelomontana* (1914), and vol. ii. (vol. i. appeared in 1907) of J. G. Mayer's *Geschichte des Bisthums Chur* (1914), and vol. v. (1917) of E. Doumergue's *Jean Calvin.*

Another subject of great importance to Switzerland is treated of in H. A. Gurtner's *Zur Verschuldung des schweiz. Hotelgewerbes* (1918), written by a Swiss hotel-keeper's son.

The following works refer to the Swiss Alps—Julien Gallet, *Dans l'Alpe Ignorée* (1910); E. J. P. de la Harpe, *Les Alpes Valaisannes* and *Les Alpes Bernoises* (1911 and 1915 respectively); and H. Dübi, *Die ersten 50 Jahre des Schweizer Alpenclub* (1913, also in French).

Turning now to the several cantons the following works deserve mention:—

Basle: R., Wackernagel, *Geschichte der Stadt Basel* (vol. ii. 1916, vol. i. appeared in 1907); A. Heusler, *Geschichte der Stadt Basel* (vol. i., 1917).

Geneva: L. Cramer, *La Seigneurie de Genève et la Maison de Savoie, de 1559 à 1605* (2 vols. 1912); H. Heyer, *L'Église de Genève, 1535–1909* (1909); L. Blondel, *Les Faubourgs de Genève* (1919; vol. iii. 1918) of the *Recueil Généalogique Suisse*; W. Oechsli, *Les Cantons Suisses et Genève 1477–1815* (1915); and E. Doumergue, *La Genève des Genevois* (1914).

Ticino: Karl Meyer, *Leventina und Blenio von Barbarossa bis Heinrich VII.* (1911).

Valais: D. Imesch, *Die Walliser Landrats-Abschiede seit 1500* (vol. i., 1500–19, 1916); and A. Büchi, *Korrespondenzen und Akten zur Geschichte des Kardinals Matth. Schiner* (vol. i., 1489–1515, 1920).

Vaud: B. van Muyden, *Pages d'Histoire Lausannoise* (1911), and *Recueil de Généalogies Vaudoises* (4 parts, 1912–20).

Zürich: K. Dändliker, *Geschichte der Stadt und des Kantons Zürich* (3 vols., 1908–12). (W. A. B. C.)

SYDENHAM, GEORGE SYDENHAM CLARKE, 1st Baron (1848–), British soldier and administrator, was born in Lincolnshire July 4 1848. He was educated at Haileybury and Wimbledon, and afterwards at the Royal Military Academy. In 1868 he entered the Royal Engineers, and in succeeding years served in various expeditions abroad, including the Sudan operations of 1885. The same year he returned to England, and was employed at the War Office until 1892, being at the same time secretary to the Colonial Defence Committee. He was also secretary to the Royal Commission on Navy and Army Administration. From 1894 to 1901 he was superintendent of the royal carriage factory at Woolwich. During all these years Sir George Clarke, who was created K.C.M.G. in 1893, had earned a great reputation, outside as well as inside his profession, as an authority on military questions, over and above his special subject of fortification. On his retirement from Woolwich, he was made a member of the important committee on War Office reorganization. In 1901 he was appointed governor of Victoria (Australia), and on his retirement in 1904 he became secretary to the Committee of Imperial Defence. From 1907 to 1913 he was governor of Bombay. He had been created G.C.M.G. in 1905, and in 1913 was raised to the peerage. He subsequently took a vigorous interest in many public questions, becoming chairman of the Royal Commission on Contagious Diseases (1913–5), chairman of the Central Appeal Tribunal (1915–6), and president of the National Council for Combating Venereal Diseases. In addition to his classic work on *Fortification* (1890; 2nd ed. 1907), his publications include *The Navy and the Nation* (1897) and *Imperial Defence* (1898), besides handbooks on military subjects.

SYKES, SIR MARK, 6th Bart. (1879–1919), English traveller and politician, was born March 16 1879, the only child of Sir Tatton Sykes, 5th Bart., of Sledmeer, Yorks. He was educated at the Roman Catholic public school of Beaumont College and afterwards at the École des Jesuites, Monaco, and Jesus College, Cambridge. He served in the South African War (1902), in 1904 became secretary to Mr. George Wyndham in Ireland, and in 1905 went to Constantinople as honorary attaché to the British embassy, remaining there until 1907. Before this, however, he had begun a series of travels and explorations, especially in Turkey and the Near East. He published several works dealing with his various expeditions, among them being *Through Five Turkish Provinces* (1900); *Dar-el-Islam* (1903); and *Five Mansions of the House of Othman* (1909). He also prepared maps of the north-western region of Mesopotamia and of the southern districts of Palestine, for which in 1906 he was thanked by the Army Council and Foreign Office. His knowledge of these regions proved invaluable during the World War. In 1911 he was elected to Parliament for Central Hull as a Unionist, and in 1913 he succeeded his father as 6th Baronet. On the outbreak of war in 1914, Sir Mark Sykes raised a battalion of the Yorkshire Regiment, but did not proceed with it to France. He was sent on important special missions to Russia, Mesopotamia and Syria, and published in 1915 *The Caliphs' Last Heritage.* He died suddenly in Paris Feb. 16 1919.

SYMPATHETIC NERVOUS SYSTEM, in physiology (*see* 26.287). On studying the effects of stimulation of the sympathetic nervous system it appears that they are directed towards activating the body for fight or flight. The dilatation of the pupil increases the perception of light; the acceleration and augmentation of the heart-beat increases the blood supply; the constriction of the blood vessels in the visceral area raises the blood pressure, driving the blood from the digestive area, whose functions are simultaneously inhibited, into the skeletal and cardiac muscles, the lungs and the brain. The sweat glands are stimulated to cool the blood heated by increased muscular effort and the hairs are erected in many animals to render them more alarming. The "goose skin" experienced by man under emotional stress is similarly produced, though not now advantageous. Some emotional responses, like some bodily structures, are vestigial remains. The other division of the autonomic system, to which the name of parasympathetic has been given, serves the purpose of building up reserves and of fortifying the body against times of need and stress. Thus by contracting the pupil it shields the retina from excessive light; by slowing the rate of the heart it gives it longer periods for recuperation; it excites appetite and by promoting the assimilation and digestion of food it stores up energy. The sacral division of the parasympathetic is a mechanism for emptying, thus leading to greater comfort. The sympathetic is, therefore, katabolic, converting potential energy into kinetic, and facilitating outward manifestations of that energy; while the parasympathetic is anabolic, directing energy inwards, where it is stored up. When these two are distributed to the same structure their action is always antagonistic.

In pain, fear, rage and any intense excitement, the sympathetic neurons are brought rapidly into play and the action of the cranial division of the parasympathetic is inhibited. Anabolism is in abeyance and katabolism goes on unchecked. This is comprehensible, since these katabolic activities are defensive in origin and aided the primitive animal in its struggle with or flight from its enemy.

Of late it has been realized that each of these divisions of the autonomic system coöperates with its appropriate group of endocrine glands. The sympathetic group consists of the adrenals, the thyroid and the pituitary—each of which are accelerators of metabolism. The intimate relationship embryologically, structurally and functionally between the nervous and glandular elements is best illustrated by the adrenals. The medulla of the adrenals and the sympathetic ganglia originated from similar cells, preganglionic fibres end round both, and adrenalin, the secretion of the medullary portion, produces the same effect on any part as stimulation of the postganglionic fibres; an interesting example of parallelism between a nervous and chemical mechanism. Just as the preganglionic fibre stimulates the secretion of adrenalin, so adrenalin increases the postganglionic responses.

A similar reciprocity exists in the case of the thyroid; it is stimulated to secretion by the sympathetic and the secretion lowers the threshold to sympathetic stimulation. The existence of sympathetic secretory nerves to the pituitary has been shown, but there is no definite evidence of a reciprocal action of its secretion on the sympathetic.

The endocrine group which coöperates with the parasympathetic must be looked for chiefly in the glands of the alimentary tract and its annexes, since the building up of energy must ultimately be derived from the food. Gastric secretion is started by the appetite and the taste of food reflexly stimulating the organs, but it is continued by a hormone in the pyloric glands of the stomach which spur the fundus glands on to renewed effort. In its turn the acid gastric juice entering the duodenum acts on its mucosa to form secretion, which stimulates secretion of pancreatic juice. But the pancreas forms an internal secretion as well, which promotes the assimilation of sugar. Indeed, the metabolism of sugar gives a particularly good illustration of the general principle here laid down. Acting muscle requires three and a half times as much sugar as resting muscle, and the mobilization of sugar into the blood is a necessary preliminary to muscular effort. Accordingly sympathetic stimulation is found to produce this effect, through the adrenals, thyroid and pituitary, the secretion of each of which taken separately will lower carbohydrate tolerance and may excite glycosuria. On the other hand, the pancreas which is innervated by the parasympathetic has a precisely opposite effect, the antagonistic action of the glands being as definite as that of the associated nerves. Another example of this antagonism is seen in the continuous flow of pancreatic juice following removal of the adrenals, which can be temporarily inhibited by injection of suprarenal extract. Again, it is well known that adrenalin dilates the pupil of an excised eye but not of the intact eye of a normal individual. Therefore something inhibits the adrenalin effect. In depancreatised dogs adrenalin does dilate the pupil, and it has been found to do the same in patients suffering from pancreatic disease, since the normal antagonism of the pancreas to the adrenals is then lost. This pupillary response may also be present in hyperthyroidism, suggesting that the thyroid excess inhibits pancreatic activity, allowing adrenalin to show its dilator action unchecked.

The sympathetic nervous system, the endocrine glands and the gonads form a basic tripod entrusted with the duty both of the preservation of the individual and the continuity of the species. Their relationship is shown in disease as well as in health, and is reflected in many neuroses and psychoses. Disease is the resultant of some external action and of the reaction of the organism against it. It therefore draws on the defensive mechanisms and connotes a position of less stable equilibrium in which the body works with more friction. It may demand an increased supply of hormones to compensate for this, which may ultimately lead to exhaustion of the gland that provides it. In this way the balance between the endocrine glands is disturbed, either from overaction of a gland, or from its unopposed action through the loss of an antagonist.

The sympathetic-endocrine system is affected alike by toxic, nutritional or psychic factors, and is particularly likely to be injuriously influenced if more than one such factor is overtaxing it. As this system has to defend us against internal foes, such as bacterial infections, as well as external enemies, we find that it plays an important part in the regulation of the body temperature. Since it has been shown that the cerebral vessels are remarkably impermeable to drugs and toxins as long as they maintain their integrity, it has become impossible to explain febrile reaction to infection by a central mechanism. When the activity of the thyroid and anterior lobe of the pituitary is diminished, less heat is produced. When increased production is required, the thyroid and adrenals give histological evidence of increased secretion. Cramer has found this both in fevers and after exposure to cold. He has also experimentally produced such changes by the injection of a drug which causes fever. Infections such as gas gangrene which do not induce a febrile reaction do not produce these changes. He has traced the adrenalin into the blood vessels, whereby sympathetic nerve endings all over the body will be stimulated. At the same time more sugar is poured into the blood, largely through thyroid activity. The oxidation of this sugar increases heat production. It has long been known that the adrenals may show marked signs of exhaustion after a severe infection such as diphtheria, while the thyroid may suffer after typhoid fever. Such exhaustion appears to be an important factor in the psychoneuroses of convalescence.

The influence of nutritional factors on the apparatus is seen in the way in which (1) pregnancy enlarges the thyroid and pituitary; (2) vitamine defects cause enlargement of the adrenals and pituitary while causing some atrophy of other endocrine glands; (3) deficiency of assimilable protein in the food causes pellagra in which the adrenals suffer, while the sympathetic nervous system shows actual structural degeneration. While toxic and nutritional influences play chiefly on the glandular part of the apparatus, psychic factors naturally act primarily on the nervous part, though ultimately both parts will become affected, whichever is involved first. The sympathetic is the lowest level of the nervous system and retains several characteristically primitive features, such as peripheral ganglion cells, myenteric nerve nets, connector fibres lying outside the central nervous system, and urgent widespread responses, rather than accurately localized and discriminative ones. This is in accordance with the evolution of the nervous system for defense, and with the maintenance of this primitive function by the sympathetic. Pain has been shown by Trotter to be the specialization of the primitive sensation of lower animals, and fear might similarly be regarded as a specialization of a primitive emotion. It is to such sensation and emotion that the sympathetic nervous system preëminently responds. Both pain and fear are apt to become intense when the appropriate motor response is prevented, though they may not be appreciated when vigorous response is possible. Thus during the excitement of a fight neither fear nor pain may be experienced under conditions which would ordinarily induce them. In the civilized state the response appropriate to primitive man has often to be repressed. The effect of this repression may show itself either as an anxiety neurosis, at the psychic level, or at the sympathetic-endocrine level in certain affections of the associated glands, and in cardiac or digestive neuroses. Such repressions are particularly likely to be necessitated when the great instincts of self-preservation, reproduction and gregariousness, which relate respectively to the life of the individual, of the species and of the community, come into conflict with one another. The constant demand for adrenalin when sympathetic action is increased in fear and anxiety may lead to exhaustion of the gland. Addison's disease presents a clear-cut picture of adrenal deficiency in its symptoms of muscular weakness, low blood pressure, pigmentation and vomiting. Although this is due to organic changes, slighter degrees of a similar condition are now recognized and it has been suggested that this enters into many war neuroses and other functional states characterized by vasomotor instability, low blood pressure and myasthenia. Conversely, prolonged oversecretion by the adrenals must tend to raise blood pressure through the sympathetic, tending in turn to arteriosclerosis, with all its widespread effects. The well-known influence of anxiety in producing this condition can thus be explained.

There is a close association between the thyroid, the reproductive organs and the sympathetic. The thyroid tends to enlarge at puberty, marriage and in pregnancy, while myxoedema is most apt to occur after the climacteric. Amenorrhoea is common even in the minor degrees of hyperthyroidism. The effect of sympathetic irritation in producing thyroid enlargement and Graves' disease is now recognized. Cushing showed that if in cats he sutured the phrenic nerve to the cervical sympathetic so that every respiration stimulated the latter, he could produce the symptoms of Graves' disease. The influence of distressing emotions in producing hyperthyroidism was well shown during the air-raids on London during the World War. Epidemics of Graves' disease also followed the Kishinev massacres and the San Francisco earthquake. Again, if a distressing emotion has a matrimonial origin, it is particularly likely to induce Graves' disease, for here each limb of the basic tripod is involved. The disease has been compared with a state of continuous fear, a description which tallies with its general appearance.

The pituitary body also shows the two-fold association with the reproductive organs and the sympathetic nervous system. The anterior glandular part has an effect on temperature, the growth of bone and skeletal tissues and the reproductive organs. The intermediate lobe influences carbohydrate metabolism, while the secretion of the posterior lobe is mainly a stimulant to plain muscle and to the secretion of milk. The effect of the secretion of the posterior lobe on diuresis is still a matter of controversy, but it is clear that disease of the posterior lobe is often found in diabetes insipidus and that stimulation of the sympathetic nerves to the gland will cause polyuria. Probably hysterical polyuria is thus produced.

It is also clear that some cases of glycosuria are of sympathetic nervous origin; the physiological mechanism by which this can be brought about has already been explained. Diabetes is characterized, like sympathetic stimulation, by an exaggerated katabolism. This shows its effect first on the most abundant and most easily metabolised of the food-stuffs, the carbohydrates, which are also essential for muscular action, to which sympathetic stimulation should normally be a preliminary. Sympathetic stimulation induced by various disagreeable emotions will increase metabolism generally and specially lower carbohydrate tolerance. The influence of excitement and emotion in causing glycosuria is well recognized. It is commonest in Jews, a notoriously emotional race. When stocks go down in New York, says Crile, diabetes goes up. Temporary glycosuria occurred in a number of men who merely watched a football cup-tie without participating in it. Glycosuria has been, unfortunately, comparatively common in young officers entrusted with heavy responsibilities during the war. Singer and Clark have recorded two cases in which there was alternation between glycosuria and the exhibition of mental symptoms, as if the emotional discharge asserted itself either at the metabolic or the psychic level but not at both.

Finally, the inhibitory effect of the sympathetic on the digestive processes must be remembered. Fear checks the secretion of saliva, anger stops the secretion of gastric juice. Depressing emotions acting through the sympathetic check the peristalsis of the stomach while closing the pyloric sphincter, thus leading to a dilatation of the stomach. A similar inhibition of intestinal peristalsis may occur, leading to intestinal stasis. This in its turn will lead to a drag on the sympathetic nerves in the mesentery, increasing their inhibitory effect. Thus a vicious circle is established and the persistent intestinal toxaemia that results may produce organic changes in many structures, including the group of endocrine glands which coöperate with the sympathetic.

The consideration of diseases produced through the agency of the parasympathetic lies outside the present topic, except in so far as the vagus may overact from a loss of balance produced by diminished sympathetic action. Suffice it to say that laryngeal spasm, asthma, slow or irregular action of the heart, low blood pressure, hyperchlorhydria, spastic constipation and a liability to skin disturbances of the vasodilator type are among the symptoms evoked. Since febrile reaction to disease is a function of the sympathetic, which is antagonistic to the parasympathetic, we find that those subjects with an overacting vagus do not react well to infections and, indeed, show an abnormal sensitiveness to many foreign proteins. Their tendency to undue anabolism is sometimes indicated by their tendency to flabbiness of the tissues and overgrowth of lymphoid structures. A curious point is the occurrence of sweating, since the secretion of the sweat glands is under the control of the sympathetic. But a similar discrepancy is seen in the action of a vagotropic drug such as pilocarpin.

In assessing the effects of the sympathetic nervous system in disease, it must be borne in mind that we have very little knowledge of its morbid anatomy, though a beginning has been made in the study of pellagra. The evidence so far mainly relates to function and were our knowledge of its structural alterations at all comparable to what we know of organic changes in the spinal cord, we should be on firmer ground. But enough has been learned to show that the sympathetic plays a large part in the regulation of the internal viscera, and, through the endocrine glands, in general metabolism. The balance between these glands determines to a large extent both the racial and individual characteristics. Climatic influence has a profound effect through the skin on the sympathetic nerves and hence on the endocrine glands. The development of protective pigment is an important method by which the sympathetic-endocrine system can react to this, and the unadaptibility of albinos in this respect is well known. Thus physical environment can influence both temperament and structure, and the sympathetic-endocrine system must have played a large part in developing the variability of man into different races.

Evolved in a subconscious plane the sympathetic nervous system remains for ever beyond the control of the will. Timme quotes an instance which, while apparently contradicting this, proved on further inquiry to support it. This was the case of a man who could voluntarily dilate his pupils, who could cause the pilomotor muscles to raise the hairs on his arm, and who could at will produce the phenomenon of "goose-flesh" in various parts of his body. When closely questioned he admitted that the effects were produced not immediately by his will, but always by the intermediation of some association called into being by him. Thus when dilating his pupils he always imagined himself looking far into space, under which conditions the pupil does dilate. For the goose-flesh effect he would picture to himself his arm plunged into ice-cold water, and the goose-flesh appeared. Various associations produce autonomic effects without our will, and it is reasonable to infer that, if we can recall these associations through our will, the same autonomic effects will be produced.

The higher centres of the brain show their influence on the lower chiefly in the direction of inhibition. The highest organism is the most self-controlled, but the sympathetic cannot be thus controlled. The will can only help in so far as "it can make our voluntary activities harmonize with our environment." The emotional apparatus remains, as McDougall has pointed out, the most unchanging part of our nervous equipment, though the stimuli to which it responds may vary enormously in different individuals. But once the response occurs, it is extraordinarily true to type. This is comprehensible since the apparatus retains so many features of the primitive nervous system. (W. L. B.*)

SYNDICALISM.—"Syndicalism" is the name given to a form of socialist doctrine elaborated by, and born from the experience of, the members of the French *syndicats* or trade unions. On the one hand it is a body of social doctrine, or theory of social organization; on the other it is a plan of action for the realization of this ideal. Of all the social theories competing for existence it is the most purely proletarian in origin. One writer indeed has described it as "working-class Socialism" (*le socialisme ouvrier*) in contradistinction to the types of socialism originated and propagated by middle-class "intellectuals." Without unduly stressing the importance of this fact, it may be said that syndicalism is that form of socialist theory which regards the trade-union organizations, entirely proletarian in origin and direction, as at once the foundations of the new society and the instruments by which it is to be erected.

The syndicalist starts from the assumptions common to most schools of socialist thought. He affirms the inherent injustice of the wages system and the fundamental immorality of capitalist society, which is based, in his belief, on the exploitation of labour. He accepts and pushes to its logical conclusion the Marxian dogma of the class war; he therefore affirms that solidarity of interests does not, and cannot, exist as between employer and employed, between capitalist and wage-earner. From these premises he draws the usual socialist conclusion, namely, that individual ownership of the instruments of production must be abolished and communal ownership and control substituted for it. But at this point syndicalism and socialism (as usually understood) part company. Whereas the orthodox socialist demands control by the consumers acting through the State and its dependent organs the municipalities, the syndicalist demand, until very recently, was for producers' control, acting through the organizations of their own creation—the trade unions. This is the essential feature of syndicalist theory, that which differentiates it from other revolutionary schools of thought. The arguments usually employed by its advocates may be briefly set out.

State organization and control of industry are, in their view, incompatible with true working-class emancipation. The State is, and must be, an instrument of class domination; it is indeed "the executive committee of the capitalist class." It exists to defend the interests of that class, and is consequently as much the enemy of labour as capital itself. To extend its powers would be to twine the bonds of wage slavery ever more firmly about the workers' limbs. The State is, however, hopelessly wedded to an uncreative bureaucracy, incapable of initiative and ignorant of industrial technique. Its control, even if it were benevolent (which the syndicalist denies it could be), would necessarily be despotic and inefficient; the spirit of routine would combine with inexperience to crush out the possibility of economic progress. Here, as will be seen, the syndicalist endorses the ordinary individualistic criticism of State socialism. Producers' control, exercised through the *syndicats*, would, on the other hand, combine freedom with efficiency. Every worker would participate directly in the government of his industry; he would thus enjoy the substance of democracy instead of the shadow offered him by the *bourgeois* State. Moreover, the worker would be led to identify his personal interests with the successful conduct of the industry; he would have a pride in his work which would manifest itself in improved quality and greater output, thus producers' control would be justified both on human and economic grounds.

The form of social organization in which this ideal could be realized was, until recently, conceived somewhat as follows. The unit of organization would be the local *syndicat*. This would be brought into touch with the local groups by means of the *Bourse du Travail*, the present function of which is to act at once as an employment agency and a general centre for trade-union activities. When all the producers were thus linked together by the *bourse*, the administration of the latter would be able to estimate the economic capacities and necessities of the region, could coördinate production, and, being in touch through other *bourses* with the industrial system as a whole, could arrange for the necessary transfer of materials and commodities, inwards and outwards. A species of "economic federation" would thus replace the structure of capitalist industry, with which would necessarily disappear the political and administrative machinery of the State. Two features of this Utopia need to be emphasized: consumers as such were excluded from any share in industrial control, and a localized system of industry was envisaged.

This latter feature was a direct reflexion of French economic circumstances; both industry and trade-unionism were much more local in range than in other and more highly developed countries. But the movement towards large-scale organization which has so profoundly affected every aspect of economic life in recent years has produced a corresponding modification in syndicalist ideals. At the same time, it has begun to be recognized by the theorists of the movement that the consumers' point of view cannot wholly be disregarded. The experience of the World War has also had its effect. The Congress of Lyons, therefore, in 1919 was moving with the times when, in demanding the "industrialized nationalization of the great services of modern economy: land and water transport, mines, water-power, and credit organizations," it defined "nationalization" as "the confiding of national property to the interested parties, namely, the associated producers and consumers." This clearly envisages organization on a national scale and the participation of consumers' organizations in control.

Syndicalist theory starts, as has been said, from the idea of a class war which must be waged relentlessly till a complete social transformation has been accomplished. The essential weapon in this struggle is the power of the organized workers. As the cause of the conflict is economic it must necessarily be fought out in the economic sphere. Syndicalist congresses have persistently repudiated political action, and pinned their faith to a general strike as the grand instrument of social revolution. This reliance upon industrial or "direct" methods of action flows necessarily from the fundamental notions of syndicalism as to the nature of the State, and also from strictly practical considerations. Outside the mine or factory, workingmen hold divergent religious or political opinions which make effective mass action difficult, if not impossible. Inside, the nature of their employment gives them a sense of solidarity which overrides minor differences and bands them together in the *syndicat* for common defence; to persuade them to pass from the defensive to the offensive is the syndicalist's task, and in the accomplishment of this political labels and controversies would be a hindrance. Moreover, the political party is not, and cannot be, a class organization. The Socialist parties swarm with men of middle-class origin whose only bond with the workers is the slender one of opinion. In any event, the political party is an inefficient instrument for revolution; it can only operate effectively at electoral periods, and even then the mass of voters do nothing more than cast a ballot and return to their customary apathy for a term of years. Political action does nothing to rouse them from that apathy, to inspire them with revolutionary *élan*, to train them to initiative and independent thought. On the contrary, it asks for nothing better than docile followers of self-constituted leaders. The strike, therefore, is the characteristic syndicalist weapon. However limited in its scope and object, it is an educative experience; successful, it inspires the workers with a sense of power; unsuccessful, it impresses upon them the servility of their lot and the necessity for better organization and wider aims. Thus every strike is a preparation for the revolutionary "day," when the workers, or a fighting minority of them (for syndicalism repudiates as *bourgeois* the dogma of the sacredness of majority rule), shall seize the instruments of production by an "expropriatory" strike. In the meantime, they are working out from day to day, in the ordinary course of their employment, the ethics and the jurisprudence of the new social order.

The strike, of course, is not the only weapon in the syndicalist armoury. Various other means of waging the class war, known collectively as *sabotage*, are both preached and practised. These range from bad or slow work to the *grève perlée* (destruction of goods or machinery) and the *chasse aux renards* (assaults on "blacklegs" or *jaunes*). It is fair to say that many syndicalist leaders criticize these methods as destructive of the worker's moral and technical competence.

Syndicalism is essentially French in origin and reflects French working-class experience and conditions of life; nevertheless the history of Great Britain shows interesting foreshadowings of it. The idea of industrial self-government by the producers attracted for a time the mobile mind of Robert Owen; and the Grand National Consolidated Trades Union of 1834 was an attempt to realize it in practice. James Morrison, a young self-taught operative builder, seems to have originated the syndicalist conception of class antagonism on the part of the working-classes (see Max Beer, *History of British Socialism*). The Building Trades Union had developed the same notion in the previous year (S. and B. Webb, *History of Trade Unionism*). The plan of a general strike—originated by one Benbow—for a time, under the strange title of the "Sacred Month," made part of Chartist propaganda. There is no evidence, however, that these projects had any echo on the European continent. The syndicalist idea, as understood in France, may be said to have originated in the discussions of the International Working Men's Association. A French delegate to the Congress of Basle in 1869, for instance, prophesied that "the grouping of different trades in the city will form the commune of the future" when "government will be replaced by federated councils of *syndicats* and by a committee of their respective delegates regulating the relations of labour—this taking the place of politics" (Levine, *Syndicalism in France*). The collapse of trade-unionism in France after the sanguinary suppression of the Communalist insurrection in 1871 had as a necessary consequence the submergence of these ideals for a considerable period, and only a combination of favouring circumstances brought them once more to light. Among these the discontent of the organized workers with Socialist politics, and the anarchist propaganda of a general strike, may be particularly mentioned. These influences manifested themselves with increasing strength during the 'nineties in the two great labour organizations of the period—the General Confederation of Labour (or "C.G.T." under its French initials) and the Federation of *Bourses du Travail*. The secretary of this latter organization, Pelloutier, did more perhaps than any other individual to work out the characteristic doctrines of syndicalism and spread them among his fellow-workers. When these two bodies joined forces in 1902, trade-unionism in general and syndicalism in particular received an immense accession of strength, and the doctrine subsequently remained—in spite of the efforts of political socialists to capture the *syndicats* for their own purposes—the characteristic expression of French revolutionary idealism.

As such, it has inevitably received much attention from observers and writers drawn from other social classes. Of these the best known is Georges Sorel, but it is a complete error to suppose that he was the originator of syndicalism, or that he has had much influence on working-class opinion. The difficult form of his writings, with their frequent obscurity and lack of continuity, would alone have made this impossible. Sorel's adaptation of the Bergsonian doctrine of the "*élan vital*" to syndicalist purposes, and his theory of "social myths" (of which the general strike is one), have had considerable influence upon intellectual circles, but have affected no more than a fringe of working-class readers.

Syndicalist doctrine has had considerable influence outside France. In the United States, a movement of somewhat similar character arose with the organization of the Industrial Workers of the World. The Chicago Convention of the I.W.W. in 1905 drew up a declaration, the preamble of which affirmed the reality of the class struggle, embodied the theory of social organization which this involves and further made a plan for the realization of this ideal:—

> "The unit of organization industrially is the workshop or Yard Committee, wherein the workers are organized as workers, irrespective of craft, grade, or sex. These Committees are coördinated by the formation of Works or Plant Committees, composed of delegates from each Workshop or Yard Committee. The Plant or Works Committees are coördinated by delegates from each of these Committees, in a village, town, city, or district, forming a Workers' Council, in which there are also delegates from the residential committees, these latter being the units of the social aspects of the organization."

The above scheme differs very little from the general theory of syndicalism in France, and presents a simple parallel to the shop-stewards' movement in Great Britain, which indeed was based upon it. The influence of the I.W.W., it may be noted, was largely confined to the alien immigrant workers: it never penetrated the American Federation of Labor to any serious degree.

The influence of these ideas on the trade-union movement in Great Britain and Ireland has been very pronounced, though they have taken a different direction, modified by the traditional, conservative instinct of the British working-class. In Great Britain the real cause of the permeation of certain unions by syndicalist ideas was the absorption of trade-union leaders in administration or in politics, which caused them to lose touch with the rank and file. Especially is this the case with regard to the miners, the railwaymen's unions and the engineers.

Daniel De Leon was a leader of the Socialist Labour party in the United States from 1880 onwards, and his writings influenced British socialist thought, particularly in the Clyde and in the mining valleys of S. Wales. Though not a syndicalist in the strict sense, he advocated organization by industry and the general strike. It is significant that 1903 saw in England the secession of the Socialist Labour party from the Social Democratic Federation. After that date, in addition to the growing educational influence of the Independent Labour party (though this was never syndicalist), was seen the promotion of the Workers' Socialist Federation, the British Socialist party (in the post-war period) and the Communist League, all of which advocated practically the same structure of organization and policy. They all agreed in a lack of faith in political action, though not always refusing to utilize it, but their real *politik* was industrial action. After the Russian Revolution of 1917, they secured greater prominence; they became the stormy petrels of the labour world in Great Britain, and their effect on the political action of the Labour party was seen in the Council of Action in Aug. 1920.

In England, between 1900 and 1910, there was a growing dissatisfaction among the rank and file with political action, despite the fact that the influence of the Labour party in the House of Commons secured the trade-union movement freedom of industrial and political action by the Trades Disputes Act of 1906 and the Trade Union Act of 1913 to a greater degree than ever before, it was felt by the far-sighted among the rank and file that a speeding up was necessary, and State collectivism as a way out towards industrial democracy was discredited. James Connolly, the Irish Labour leader who was executed after the Easter rising in Ireland in 1916, started a similar organization to that of Daniel De Leon on the Clyde in 1905. In his pamphlet *Socialism made Easy* he enunciated the syndicalist principles "that they who rule industrially will rule politically," and that "the functions of Industrial Unionism is to build up an industrial republic inside the shell of the political state, in order that when the industrial republic is fully organized it may crack the shell of the political state and step into its place in the scheme of the universe." Tom Mann, while in France and Australia, which had imported the ideas of the I.W.W. from America, was also powerfully influenced by the same theories, while on the Rand, in S. Africa, a small but very influential group of leaders was working out the structure, forms and policy of a movement similar in character. In 1910 Tom Mann preached the new faith in all the big industrial centres and rapidly won many followers. Workmen had refused to follow their orthodox leaders from about 1908, as they felt that the trade union of the old Liberal-Labour school was behind the times. The Plebs League was founded by a group of labour students in Ruskin College, Oxford, about the same time, and in 1909 these seceded from Ruskin College and founded first a labour college in Oxford and then moved to London as the Central Labour College, financed by the S. Wales miners and the railwaymen. This educational movement organized classes in every mining area in S. Wales, led by tutors from these two colleges, and influenced largely by the new ideas. A similar movement took place on the Clyde, in the great shipbuilding centres like Barrow, Birkenhead, and Pembroke Dock, and also in inland engineering centres like Coventry and Sheffield. Then followed the railway strike of 1911 and the great coal strike of 1912. It is quite clear that the National Union of Railwaymen and the Miners' Federation of Great Britain became organized as two of the most powerful unions in consequence of the new thought, *not* because their leaders had adopted syndicalism in the form taught by De Leon and the French group of thinkers, but because they adapted it in the peculiar British way; they made it practical and definite; they shaped it in alliance with the political and trade-union structure of Britain. They disagreed with the syndicalist view of the State, but they recognized the driving power of the theories that stated "that political power is a reflex of industrial power." The transport workers soon had a similar federation, and after the strikes of 1911 and 1912, and the Irish transport workers' strike of 1913, the Triple Alliance (of railwaymen, transport workers, and miners) was formed in 1915. The failure of this last to function during the miners' strike in the spring of 1921 discredited "direct action," and the British labour movement swung back towards constitutional and parliamentary methods.

SYNGE, JOHN MILLINGTON (1871–1909), Irish dramatic author, came of an Anglo-Irish family, which had contributed several bishops to the Irish church. He was born near Dublin April 16 1871. A delicate child, he was left much to himself, and as a youthful member of the Dublin Naturalists' Field Club took long rambles over the Dublin and Wicklow hills. At Trinity College, where he graduated in 1892, he obtained prizes in Irish and Hebrew, and he knew something of several modern languages. At this period his chief interest was in music and he gained a scholarship in counterpoint and harmony in the Royal Irish Academy of Music. A sonnet, moreover, contributed to *Kottabos*, shows not a little of the accomplishment of verse, as well as his innate passion for primitive things. During the next few years (1893–8), Synge travelled in Germany, Austria, Italy, finally making Paris his headquarters. He managed to spend a third of the year in Paris, a third in the W. of Ireland, and a third in London or Dublin. W. B. Yeats found him in Paris (1898) preoccupied with theories of language and literature, and advised him to return to Ireland. He went to the Aran Is., where he shared the life of the islanders, and he gave an account of it in a series of sketches afterwards collected in the volume, *The Aran Islands* (1907). In these and other sketches of the same period he had not quite shaken off the obsession of "stylism," and still had a wish "to do for the W. of Ireland what Pierre Loti had done for the Bretons." Gradually, however, Ireland got hold of him, and, turning to the dramatization of incidents in the life he now knew intimately, he began to elaborate, partly from his note-books and partly from the writings of Lady Gregory and Dr. Douglas Hyde, that richly imaginative though largely artificial dialect of Anglo-Irish which he carried to its furthest capacities. The Abbey theatre was opened towards the close of 1904, with Synge as one of the directors. He had already produced two one-act plays, *In the Shadow of the Glen* and *Riders to the Sea* (1903), of which the first had acquired some notoriety for the author as an affront to Irish morals; he had also written a farcical play, *The Tinker's Wedding*, which proved a failure when acted (1909) after his death. The beautiful three-act play, *The Well of the Saints*, produced before a few dozen people in the early months of the Abbey (1905), was regarded as a new affront; and in Jan. 1907, rumour having got about of its subject matter, the performance of *The Playboy of the Western World* was interrupted by an organized disturbance which continued night after night for a week. This affair, when the merits of the play came to be known, made the fame of the Abbey theatre. Synge's health was now shattered, and with death in prospect he worked at his fine play *Deirdre of the Sorrows*, all but completing it before the end came on March 24 1909. Just before he had collected his curious *Poems* (1909).

Synge appeared at a peculiar moment in the development of Irish literature, which had begun to address a largely increased public, blended of the two main elements of the population. By descent and culture he was of the Anglo-Irish stock, and he really saw the Irish subject matter in the detached spirit of an artist. It was probably something like this that part of his audience detected in the *Playboy*, and it caused his work for a while to be rejected in his own country. Time, however, has already proved the depth of Synge's insight into the soul of peasant Ireland. The *Playboy* is by general consent his masterpiece. In this play, the fantastically rich imagery of his dialogue, which elsewhere has often a somewhat monotonous effect, has full dramatic justification; the play has even, like *Hamlet*, the supreme mark of vitality, that it conveys the suggestion of a permanent human enigma. There are good critics, however, who assign the highest place among his works to *Deirdre*.

A collected edition of Synge's works, in four volumes, was published in 1910. In *John Millington Synge and the Irish Theatre* (1913), M. Maurice Bourgeois has given, in great detail, an account of his life and writings; and there is a critical study of him by P. P. Howe (1912). (W. K. M.)

SYRIA (*see* 26.305).—The greater part of the decade 1911–21 was a period of depression and distress in Syria, which, in common with the rest of the Ottoman Empire of which it then formed part, suffered from the interruption of commerce and the war-time exactions consequent upon the Italo-Turkish, the Balkan and the World Wars in an almost unbroken succession from 1911 until 1918. Although only for a brief time an actual theatre of hostilities, Syria, which had escaped with a slight bombardment of Beirut in Feb. 1912 during which a Turkish gun-boat was sunk in the harbour by an Italian squadron, was particularly exposed to military requisitions and exactions.

Even before the entry of Turkey into the World War involved the Levant ports in a fresh blockade (Nov. 1914) the coastal population had begun to migrate inland from fear of enemy landings, and the whole country was disorganized by the pressure of refugees on the one hand and of the military preparations for an invasion of Egypt on the other, while the civil population was much excited by the shameless propaganda conducted by German agents who sought to inflame Moslem prejudice against Christians all over the country. The Minister of Marine, Ahmad Jemal Pasha, who was also in command of the IV. Army and governor-general, conducted the government of the province in such a way as to give rise during a long period to the suspicion that he aimed at imitating Mehemet Ali in founding for himself a semi-independent viceroyalty; and his autocratic exactions and high-handed measures did much to pave the way for the final revolt against Turkish authority, which caused its collapse when the battles in Palestine in Sept. 1918 had broken the front.

In the subsequent operations Syria was overrun rather than conquered. Damascus fell to the British and Arabs on Oct. 1, Tyre was taken by the British on Oct. 4, Beirut was seized by a French squadron on Oct. 5 and occupied on Oct. 7 by British troops, which took Homs on Oct. 16, Tripoli (Tarabulus) on Oct. 18, Hama on Oct. 21, while the Arabs took Aleppo on Oct. 25 and the French occupied Alexandretta on Nov. 10.

Immediately after the liberation of Syria Gen. Allenby set up an administration of Occupied Enemy Territory in accordance with "the Laws and Usages of War" laid down by international agreements embodied in the Hague Convention. In order to comply as far as possible with the divergent policies to which the British Government had committed itself he confided those areas which had been liberated chiefly by Arab troops to "O.E.T.A. East," with Arab administrators under a chief administrator at Damascus—'Ali Riza Pasha er Rikabi, while the Lebanon, the littoral N. of the Ladder of Tyre, and as far as Bab Yunis N. of Alexandretta, was under Col. P. de Piépape as chief administrator O.E.T.A. North in Beirut with French officers. Later, when Cilicia was occupied in conformity with the Armistice which came into effect on Nov. 1 O.E.T.A. in Beirut became O.E.T.A. West and Cilicia was controlled by a new O.E.T.A. North under the French Col. Brémond.

From the very first the French had considerable difficulties to face, as Arab Nationalism and the idea of Syrian independence based upon the doctrine of self-determination both greatly influenced the civil population, which was, moreover, puzzled in that French officers were engaged in administering the country on French lines and conducting a French propaganda, when it was notorious that British troops had liberated the country and were still occupying a great part of it, and that the Arab administration in Damascus was anxious to lean on the British alliance and to ignore as far as possible the existence of the Sykes-Picot Agreement which had divided the country into arbitrarily defined spheres of influence regardless of the claims of the Arabs. Colonel de Piépape was, moreover, much hampered by the limited selection of French officers from whom he had to pick his administrators. Furthermore, Syria being a comparatively rich and civilized part of the Ottoman Empire and inhabited almost entirely by non-Turks had been particularly exposed to the exactions of the Turkish army and Government, and her population had been greatly exhausted by military conscription, political deportations, voluntary flight of refugees and by the ravages of locusts, starvation and disease. Yet Syria was unable to benefit to any great degree from the presence of the British army, as had Palestine; few military roads were made—except the remarkable rock-cut carriage-way across the face of the Ladder of Tyre (Ras en Naqura) which was made by Sir Valentine Fane's 7th Indian Div.—little local labour was employed, and charitable contributions for the help of the civil population of Syria were the less readily forthcoming as it had none of the religious and sentimental glamour attaching to the Holy Land.

With the withdrawal of the British Army of Occupation from O.E.T.A. North and West which began on Nov. 4 1919 and ended on Jan. 19 1920 the difficulties of the French were greatly enhanced, as their own troops were hardly numerous enough to cope with the forces of disorder which began to raise their heads almost immediately. Attempts to enforce French authority were met with armed resistance. Certain of their agents played them false, and both in Cilicia and Syria Gen. Gouraud, who had become High Commissioner in Beirut in Oct. 1919, had to cope at once with Turkish Nationalist plots directed from Angora, panislamic agitation, anti-Armenian traditional hatred and Syrian and Arab Nationalism. Active troubles soon began, the Damascus administration, now controlled by the Emir Faisal, had little real authority over the semi-independent tribes which were plentifully supplied with rifles, either issued to them for war against the Turks, or captured weapons, and it was itself harassed by the conflicting policies of the Syrian extremists who resented the presence of the Arab "Patriarchalists" from the desert, and of the Hejaz Arabs who maintained that Syria was but a province conquered by them in war and lawfully at their disposal. The Emir had, moreover, to keep the peace with his French and British allies in the face of a growing anti-European spirit which was hostile to the French schemes for controlling Syria and indignant at the British attitude towards the Jews, while Syrian Nationalists resented the partition of the country between two foreign Powers and inclined towards anybody—even the once hated Turks—who offered hopes of driving the Europeans into the sea.

Baalbek was the scene of the first fighting between the French and Arabs—at Christmas 1919. In Jan. 1920 the French were attacked near Quneitera and in the Merj Iyun. Later in the month their troops were engaged in the Latakia (Ladigiye) district, and while they were able to recover Baalbek before the end of Jan. their garrison at Alexandretta was attacked in Feb. On March 1 the Jewish colony at Tell Hai, near Metulla, in what was then the French sector of Upper Galilee, was raided by Arabs. On March 8 the Syrian National Congress, sitting in Damascus, under the influence of impatient extremists, proclaimed the Emir Faisal as King of Syria, and placed him in an extremely difficult diplomatic position. In the face of the extremists he was unable to hold back, and he organized a Syrian Cabinet under Riza Pasha and did his best to enforce discipline throughout his dominions where compulsory military service had been reintroduced on Dec. 21 1919. The authority of Damascus was, however, unable to restrain the outbreak of Arab Nationalist enthusiasm which the formation of the kingdom of Syria aroused. Antioch was taken from its small French garrison on March 20, there was anti-European trouble from the Amanus to Jerusalem (*see* PALESTINE), and Arab officers entered into renewed relations with the Nationalist Turks of Angora. As early as Dec. 11 1919 Ramadhan ibn Shalash, the Arab governor of Raqqa, instigated by Angora, had made common cause with a Kurdish freebooter, Ibrahim Pasha Milli, and had attacked Deir ez Zor, from which, although in the French sphere of influence, the British had not yet withdrawn. The Emir Faisal immediately dismissed Ramadhan, but he became contumacious, declined any longer to recognize the authority of Damascus and openly adhered to the Nationalist Turks. His Arab successor in Raqqa, Maulud Pasha, was equally disloyal, and throughout the summer disturbances in both French and British areas were actively fomented by him and other disobedient adherents of the Damascus Government.

More vigorous steps were taken by the Nationalist Turks of Angora. Not content with conducting a campaign of extermination against the Armenians in Cilicia where the French were not strong enough militarily to occupy the whole province in the face of the formidable Turkish forces operating against them and the Armenians, the Government of Angora invaded northern Syria itself. Aintab was attacked in strength on April 1 1920. It was relieved by a French column with some difficulty on April 15–16, but, when the relieving troops were withdrawn on April 28, the siege was resumed on April 30. It was relieved a second time on May 22, and an armistice was concluded on May 29 by which the French evacuated the citadel and established themselves in a fresh position. They were again attacked by the Turks and relieved for a third time on Aug. 11. This time the French were strong enough to attack in their turn, although unable entirely to invest the Turks, who had occupied the citadel as part of their position. After long-drawn operations, during which the Turkish mines in one of the piers of the great bridge of the Bagdad railway over the Euphrates at Jerablus were exploded by lightning and two spans of the bridge wrecked, the French were successful, and Aintab was once more made safe on Feb. 10 1921. During this period its pop. is supposed to have decreased by some two-thirds to 25,000. Nor were the disturbances in the N. confined to the Aintab area, apart from the campaign in Cilicia. Nationalist Turks and Syrians at the beginning of Dec. raided as far S. as Jebele on the coast 14 m. S. of Latakia, and farther E. a force of Nationalist Turks established themselves near the newly fixed boundary between Syria and Mesopotamia and tried to stir up unrest among the desert tribes.

In the S. the existence of an independent state at Damascus with Nationalist aspirations to absorb all Syria and the Lebanon, and unwilling to admit French influence or recognize any French mandate, was likely to prove an uneasy neighbour—the more so as the Emir Faisal had declined on two occasions (March 27 and May 8) to repair to Paris at the invitation of the Allies to explain the situation. The Emir maintained that it was only by remaining at Damascus that he could hope to restrain the more extreme Nationalists from launching a wholesale attack upon French territory. As soon, therefore, as Gen. Gouraud had an adequate force at his command with which to enforce the authority given to France as Mandatory for Syria on behalf of the League of Nations, he made ready to impose it upon Damascus, when in June 1920 the Emir Faisal was beset by difficulties. Himself one of the Ashraf, a son of the King of the Hejaz, he found it increasingly difficult to restrain the Nationalist Syrians, the pro-Turk panislamists and the Patriarchalist tribesmen who were traditionally hostile to any authority which sought to stand between them and their prey in the cultivated lands. In June the Cabinet of Riza Pasha fell, largely on the question of the relations between Syria and the Europeans—particularly the French, and Hashim Bey Attassi took office. At that time in the discussions of the budget in the French Chamber it appeared that France, while proposing to allot some £3,700,000 for the expenses of the High Commissionership of Syria and some £440,000 for propaganda to be directed against the extremist doctrines of those opposed to her rule, was ready to grant a subvention of £800,000 to the Emir Faisal provided that he co-operated whole-heartedly in the execution of the Mandate. The Emir was, however, in no position to do so, owing to the intractability of the Nationalist leaders who threatened to depose or murder him if he ventured to abate in any way from the extreme of their ambitions, wholly incompatible with any foreign Mandate. At the same time the economic situation of Syria was bad, and the taxes were extremely high—for example, the camel tax in Syria was £E3 (£3 1s. 6d.) per beast as against 1 rupee (1s. 4d.) per beast in Mesopotamia, and the sheep tax was 36 P.T. (7s.) against 8 annas (8d.)—and were, moreover, farmed, owing to the absence of the necessary fiscal machinery for ensuring official collection. Thus the Emir's Government was regarded with suspicion by the Nationalists and those who were opposed to any accommodation with France, or indeed any European Power.

On July 14 1920 Gen. Gouraud informed the Emir that French authority was to be enforced and that he would assume control of the Syrian railways—hitherto run by the Arab administration, parts of which had not been working since January. This intimation was none too soon, as it was known that the Arab general, Rushdi Bey, in command of the 3rd Arab Div. and governor of Aleppo, who had formerly been in the Ottoman service, was in active communication with the Nationalist Turks of Angora for the purpose of arranging joint operations against the French. Almost at the same time Gen. Gouraud found it necessary to arrest nine members of the Administrative Council of the Lebanon, apparently for conspiring with Syrian Nationalists to make it impossible for France to exercise her Mandate.

The Emir Faisal was willing to comply with Gen. Gouraud's wishes, but the Syrian Nationalists, miscalculating their strength, opposed the advance of Gen. Goybet's column which was sent to occupy Damascus. They even attacked the Emir Faisal, delayed the final message of submission sent by the Emir and his Cabinet to Gen. Goybet, and by ill-judged hostilities compelled the French to defeat them smartly at Khan Meiselun on the road through the mountains N.W. of Damascus on July 24, and to enter that city next day as conquerors rather than as protecting allies, thus bringing about the downfall of the Emir, whom the French held responsible for the resistance of the Nationalists although it had been offered in defiance of his authority and policy. The Emir's last Cabinet fell with him, and the French, who inflicted a fine of £S500,000 (10,000,000 frs.) upon the country, caused a new administration to be formed under 'Ala ed Din er Rubi, while the Emir Faisal and his family withdrew from Damascus on July 28, going to Haifa, where he remained until Aug. 4, when he left for Europe.

The suppression of the Nationalists at Damascus did not immediately bring peace to the country, as the French were unable adequately to control the Hauran, and on Aug. 20 Bedouin raiders stopped a train at Khirbet el Ghazali on the Hejaz railway and murdered the Syrian prime minister 'Ala ed Din er Rubi, Ata el Ayyubi, the Minister of the Interior, and 'Abdurrahman Yusuf, President of the Council of State; for some time afterwards railway communication was hazardous in that area, and trains were generally protected by a guard of soldiers in armoured trucks at either end.

On Sept. 1 1920 Beirut became an autonomous district of the Greater Lebanon (*Grand Liban*), which was enlarged from its former extent under the Turks so as to embrace all Biqa' or the Coelesyria composed of the Turkish kazas of Hasbeya Rasheya, Biqa' and Baalbek (which, originally allotted to "O.E.T.A. West," were left to the administration of O.E.T.A. East by Gen. Allenby as having been largely liberated by Arab troops), and the coast territories between Palestine and the Nahr 'Akkar; and next day the former Turkish sanjak of Latakia and the northern parts of that of Tripoli were formed into a new administrative area of Alawiya (*Territoire des Alaouites*). In the N. the Turkish sanjaks of Alexandretta, Deir ez Zor and Aleppo, were united (Sept. 1 1920) to form the "Government of Aleppo," which thus extended to the Khabur, beyond which the country was under the administration of the French officer commanding in the *Confins Militaires;* and by the end of the year the caravan route over the Beilan Pass above Alexandretta was so far cleared of Turkish raiders and Arab marauders that civilian traffic began to be resumed. In the S. however the Hauran was still disturbed, and in March 1921 a party of Arab raiders blew up bridges on the Hejaz railway over the Yarmuk and to the N. of Dera, while the Syrian Nationalists were reported to be active in that sector of the British sphere beyond the Jordan which still formed part of the Emir Faisal's dominions but was not in any way subject to British authority. In April however this danger was abated, as the Emir's elder brother, the Emir ʽAbdalla, arrived in ʽAmman and restored order throughout the area of the ancient kingdom of Kerak in coöperation with the British.

Frontiers.—On Dec. 23 1920 the frontiers towards Mesopotamia and Palestine were fixed in such a way as to retain the whole of the Litani-Leontes watershed with Quneitera in French mandated territory, and providing for the joint Anglo-French use of the railway between Semakh and Nasib, although the line itself remains in French territory. On the side of Arabia the frontier runs from Nasib to Imtar and thence in a straight line to Abu Kemal on the Euphrates.

In March 1921 Gen. Gouraud, when in London for the Near Eastern Conference, took advantage of the presence of the representative of the Nationalist Turkish administration at Angora, Bekir Sami Bey, to conclude an agreement, in virtue of which the French withdrew from the whole of Cilicia, and adopted as the northern frontier of their Syrian mandated territory a line running from Payas on the coast N. of Alexandretta to Choban Beg (Bey) on the Bagdad railway, and thence along the railway to Nisibin, whence it runs to the Tigris and down that river as far as the frontier of Mesopotamia near Jeziret ibn ʽOmar, thus restoring Killiz, Aintab and Urfa (Edessa) with an area of 22,500 sq. km. and an estimated pop. of some 640,000, to the Turks.

On March 4 1921 the formation of an autonomous Druse (Druz) State, comprising the Jebel ed Druz in the Hauran, to be under French supervision but independent of Damascus, was announced.

Area and Population.—Thus the area comprised in Syria as defined by the boundary agreements of Dec. 1920 and March 1921 is divided into the Greater Lebanon (*Grand Liban*), Damascus, Jebel ed Druz, Alawiya, Aleppo and the military territory.

Although no exact census had been taken in Syria the following figures are supplied by the French administration:—

I. Greater Lebanon (*Grand Liban*):

	Sanjak	Capital	Area sq. km.	Pop.
(*a*)	South Lebanon	Sidon (Saida)	2,172	132,000
(*b*)	Biqaʽ	Zahle	3,600	110,000
(*c*)	Mount Lebanon	Baʽabda	3,000	180,000
(*d*)	North Lebanon	Shtora	2,065	164,000
(*e*)	City of Tripoli			
(*f*)	City of Beirut		18	140,000
	Total		10,855	726,000

II. Alawiya (*Territoire des Alaouites*):

(*a*) Sanjak of Latakia—composed of the kazas of Jebele, Sahyun, Baniyas (Valenia), Omranie or Masyaf and the municipal area of Latakia.

(*b*) Sanjak of Tartus—composed of the kazas of Tartus (Tortosa) Safita, Qal ʽat el Husn.

Total area 6,200 sq. km. with a pop. of perhaps 400,000.

III. Government of Aleppo:

(*a*) Sanjak of Alexandretta, area 5,000 sq. km. divided into the kazas of Alexandretta pop. 26,000, Beilan pop. 20,200, Antioch pop. 126,900, and Harim pop. 36,700, or 209,800 inhabitants for the sanjak.

(*b*) Sanjak of Deir ez Zor, area 30,000 sq. km. and a pop. of 174,000.

(*c*) Sanjak of Aleppo:

	Area sq. km.	Pop.
City of Aleppo	—	144,006
Kaza of Jebel Simaʽan	4,694	25,130
El Bab	2,437	27,752
ʽAzaz	2,200	9,957
Membij	3,867	5,030
Maʽaret en Nuʽman	3,450	21,629
Idlib	1,800	53,598
Raqqa	7,200	9,865
Jisr esh Shughr	1,125	36,018
	26,773	332,985
Total for the whole Government	61,773	716,785

IV. Government of Damascus:

		Area sq. km.	Pop.
(*a*)	Sanjak of Damascus:		
	Kaza of Damascus	600	238,504
	Wadi el ʽAjam	800	16,732
	Duma	841	37,937
	Zebdani	180	14,155
	Quneitera	2,000	43,183
	Jerude	12,000	29,431
	Nebk		22,221
		16,421	402,163
(*b*)	Sanjak of Hauran:		
	Kaza of Hauran	3,500	29,760
	ʽEzra	1,318	30,018
	Musmiye	3,972	14,718
	Bosra Shams	970	26,436
		9,760	100,932
(*c*)	Sanjak of Homs:		
	Kaza of Homs	4,000	88,214
	Qaryatein	4,000	6,945
	Job Jerra	2,000	4,159
	Palmyra (*Tadmur*)	10,000	5,340
		20,000	104,658
(*d*)	Sanjak of Hama:		
	Kaza of Hama	1,900	77,205
	Selemiye	2,500	20,864
	Hamra	815	—
		5,215	98,069
	Total for whole Government	51,396	705,822

Thus the whole of Syria contains:—

Greater Lebanon	10,855	726,000
Alawiya	6,200	400,000
Aleppo	61,773	716,785
Damascus Jebel ed Druz	51,396	705,822
Military Territories	25,700	154,500
	155,924	2,703,107

The precise boundaries of the state of the Jebel ed Druz had not yet been settled in 1921, but it was to be detached from the sanjak of the Hauran then in the Government of Damascus.

Administrative Divisions—Of these various administrative areas the Greater Lebanon is under a French Governor who appoints Lebanese officials to take charge of the seven departments of Interior, with *Gendarmerie* and Police; Finance; Justice and Pious Foundations; Public Works, Posts and Telegraphs; Education and Fine Arts; Agriculture, Trade and Industry; and Public Health. Each of these officials is assisted by a French adviser. The sanjaks are administered by Lebanese *mutesarrifs* with French advisers, assisted by local administrative commission. Pending a census of the population and a subsequent election a provisional administrative commission of 15 Lebanese members had been nominated. Its functions and powers are analogous to those of the old Administrative Council under the Organic statute of the Lebanon in 1864.

In Damascus the administration is directed by a Council of State composed of Ministers each assisted by a French adviser.

In Aleppo there is an Arab Governor who appoints native officials to take charge of the departments of Finance; Justice and Pious Foundations; Public Works, Posts and Telegraphs; Economic Services; and *Gendarmerie* and Militia. The Governor is assisted by a council and an administrative commission. The former is composed of the heads of the five departments, of heads of religious communities, of two members from each of the three sanjaks, and of the mayors of Aleppo, Antioch and Alexandretta. The administration is supervised by a French Resident appointed by the High Commissioner, and French advisers assist the heads of departments and the *mutesarrifs* of sanjaks.

In Alawiya a French Administrator with French heads of the four departments of Finance; Public Works, Posts and Telegraphs; Public Health; and Justice and Pious Foundations, controls the administration. There is an administrative commission composed of seven Alawiye (or Nuseiriye), two Christians, two Sunni Moslems and one Isma ʽiliye ("Assassin"). Each sanjak has a French Deputy Administrator with a native *mutesarrif* as his subordinate.

In virtue of the treaty of March 4 1921 between Gen. Gouraud and the religious and political chiefs of the Druses the State of the Jebel ed Druz in the Hauran is administered by a Druse governor elected by the population for four years, subject to the confirmation of the French High Commissioner. He is assisted by a council, elected for three years, which has one session every year during which the budget is voted, and by a permanent Administrative Commission. French advisers assist the higher Druse officials. The local *gendarmerie* and police are recruited by voluntary enlistment.

All these administrations, which are autonomous *inter se*, are subject to the general control of the French High Commissioner of Syria who resides at Beirut, going into summer quarters at Aley in the Lebanon.

Currency.—On May 1 1920 the standard currency of the pound Syrian (£S) was introduced to supersede the pound Egyptian (£E), which had been the official currency under the British occupation, and the now obsolete pound Turkish (£T). The £S is equivalent to the French *louis* of 20 frs., formerly well known in Syria, and is divided into 100 piastres of 20 French centimes each.

Railways.—During the decade 1910-20 the railway construction in Syria was chiefly directed towards improving and linking up the lines serving the trade routes across, and little attention was paid to the development of a purely Syrian system for the development of the country. The only line which can be classed in this category is that between Tripoli and Homs, which was opened in June 1911, and even this was chiefly useful for importing the heavier material required for the construction of the Bagdad railway which was being built across the country in the north. During the World War it was taken up and its rails used in the extension of the Bagdad railway towards Nisibin, but after the French administration had been established the line was relaid and the railway was again opened for traffic in July 1921. In the same way the French Hauran railway between Damascus and Mezeirib was taken up and used in Palestine.

Of the Bagdad railway, destined to link the Syrian system with Haidar Pasha, and perhaps with Europe and Mesopotamia, the Adana Osmanie (92 km.) and Dorak-Yenije (23 km.) sectors in Cilicia were opened on April 27 1911, the sector Bulgurlu-Ulu Kyshla (38 km.) in the Taurus was opened on July 7 1911, and that from Ulu Kyshla to Kara Punar (52 km.) in Dec. 1912. At the same time the Aleppo-Moslemiye (Muslimie) (15 km.), Moslemiye-Raju (77 km.), and Moslemiye-Jerablus (103 km.) fork was opened, and the branch from Toprak Kale (on the Osmanie branch) to Alexandretta (60 km.) at the foot of the Beilan Pass was opened in Nov. 1913. This branch was cut in several places by H. M. S. "Doris" in Dec. 1914, but was reopened for traffic in 1921. During the war every effort was made to complete the great tunnels in the sectors Kara Punar-Dorak and Osmanie-Raju, and, after being used for narrow gauge traffic for some months they were opened for standard gauge use just before the Armistice, and the first through train from Haidar Pasha reached Aleppo in Oct. 1918. Further E. the line was pushed forward to Nisibin:—Jerablus-Tell el Abyadh (95 km.), Tell el Abyadh-Ras el 'Ain (87 km.), Ras el 'Ain-Nisibin (120 km.).

In Dec. 1913 in return for a French loan the Porte gave a concession for the extension of the French standard gauge railway then working between Aleppo and Rayak down through the Biqua' and Galilee to Ludd in Palestine, but nothing came of it, and no steps were taken to start the harbour works at Jaffa, Haifa, Tripoli and Alexandretta for which permission was granted at the same time.

During the war the railways of Syria were greatly strained to meet military requirements, damaged by hostile action, and inadequately kept up, rolling stock became worn out and many engines built for coal consumption were forced to use wood. As a result when the French took over the control of the Syrian railways in July 1920 they found them in need of wholesale reconstruction.

Agriculture.—The chief Syrian industry is agriculture, and it is estimated by the French authorities that of 11,000,000 ac. available for cultivation in Aleppo, W. of the Euphrates, only about 1,500,000 were in 1921 under the plough. A still larger and even less developed area is known to be available for agriculture E. of the river. In the sanjaks of Hama and Homs and in the Biqua' the cultivable area is estimated at over 1,000,000 ac., while the Damascus oasis contains 1,500,000 ac. of good land.

The corn lands of the Hauran are reported to have produced 230,000 tons of wheat in 1919-20, of which 115,000 was exported to neighbouring districts. During the war the Haurani cultivators were generally able to sell their wheat to the Turks for gold, and it is estimated that they obtained £E2,000,000 in this way. Payments for animals and labour however were only in depreciated paper.

The tobacco district of Latakia in Alawiya used to produce some 1,000 tons of tobacco annually.

The production of silk in Syria, which fell during the war to less than one-tenth of its former volume, began to revive in 1920, and the export from Beirut nearly doubled on the 118 tons of silk and 82 tons of cocoons and allied materials exported in 1919.

Before the war it was estimated that there were some 5,000,000 sheep, 1,000,000 goats, 500,000 kine and 250,000 camels in Syria, but during the war it appears that the sheep and goats were reduced by at least 50%, the kine suffered more severely, and the camels, which were very wastefully used by the Turks for military purposes, were still further reduced in numbers, at least 40,000 having been lost in the Jordan valley alone in 1916-7.

Commerce.—The trade of the port of Beirut since 1910, the last complete year of peace, may be summarized as follows:—

	Imports Tons	Exports Tons
1910	233,297	50,934
1911	216,162	48,078
1912	145,054	53,072
1913	193,844	49,248
1914	118,917	30,588
1919	64,547	18,547

Exports of Syrian produce from Beirut in 1911, the last normal year of peace, and in 1919, the first complete year since the Armistice, were as follows:—

	1911 Tons	1919 Tons
Wool	5,500	1,521
Hides	400	122
Olive Oil	233	90
Apricots	4,468	1,436
Wine	161	7
Gums	40	34

During the first quarter of 1920 466 tons of wool were exported from Beirut and 248 tons from Alexandretta, which had just been reopened for commercial traffic. In that period 67 tons of hides were exported from Beirut. For 1919 the value of imports was declared at the Customs as follows:—

	£E
Jan.	59,597
Feb.	223,111
March	629,614
April	376,117
May	551,737
June	900,370
July	1,213,974
Aug.	534,332
Sept.	848,570
Oct.	781,366
Nov.	1,031,477
Dec.	895,248
	£E8,045,513

It must, however, be remembered that goods have to be declared at their local value, on which an 11% *ad valorem* duty is collected. During 1909 prices for imported goods were unreasonably high.

Archaeology.—Before the war extensive excavations had been started on the site of the ancient Carchemish, near Jerablus, under the direction of D. G. Hogarth, with the aid of T. E. Lawrence and C. L. Woolley. These operations, which had yielded highly satisfactory results after the interruption due to the war, during which these three archaeologists all distinguished themselves by their widely different services against the Turks, were resumed in Jan. 1920 under Mr. Woolley, and pursued in spite of the prevalent unrest and the actual hostilities which went on in the immediate neighbourhood. (H. P.-G.)

SZÉLL, KOLOMAN (1845-1915), Hungarian statesman, was born on June 8 1845. He studied at Pest and Vienna, and in 1867 became deputy for the district of St. Gotthard. He very quickly won the reputation of being remarkably well informed on economic and financial questions. Széll was one of Deák's intimates, whose ward, the daughter of the Hungarian poet Vörösmarty, he had married. In 1875 he was Finance Minister in the Cabinet of Koloman Tisza, and as such imposed on himself the task of restoring the shattered credit of Hungary. In 1878 he concluded with Austria the first economic *Ausgleich*. At that time the single Austrian bank was changed, in conformity with this arrangement, into the dualistic Austro-Hungarian bank, and Széll consolidated the Hungarian Rentes, and nearly succeeded in balancing the State finances. As he feared that this balance would again be upset by the occupation of Bosnia and Herzegovina, he resigned from the Cabinet, incurring thereby the displeasure of the Crown. He still kept his seat in Parliament, and as deputy constantly criticized the financial policy of the Tisza Cabinet. At the beginning of the eighties Széll founded the Hungarian Mortgage Credit Bank, of which he was governor until the end of his life. He opened entirely new sources of credit for Hungarian agriculture. He declined repeated offers of the portfolio of Finance. When the Banffy Ministry suffered a serious crisis at the end of 1898 and was compelled to resign in Feb. 1899, Széll was entrusted with the formation of a new Cabinet. By means of the Pact of Feb. 23 1899 he restored parliamentary peace. On the basis of the so-called Széll formula the new *Ausgleich* with Austria until the year 1907 was concluded after long negotiations. The most important result of this was that Hungary attained the status of an independent customs area, but, under the arrangement for reciprocity, still maintained intact the existing conditions of the Customs Union with Austria. In 1901, under Széll's Ministry, the new elections resulted in a Liberal victory. A year later began the struggle for the reform of the national defence, and Széll introduced in 1902 the law for increasing the number of recruits, in exchange for which the Independent party wanted concessions to the principle of nationality. The obstruction against the provision for defence lasted from the end of Jan. to April 4 1903, and resulted in the suspension of the constitution ("*Ex lex*" condition). Széll sought to wear down the opposition by delay. As part of the majority would not agree to this, he resigned on June 16 1903. When his successor, Count Stephen Tisza, on Nov. 18 1904 brought about a split in the Liberal party by forcing through Parliament new rules of procedure, Széll joined Count Andrassy in the secession from the party. Under the Coalition Cabinet of Wekerle, Széll was chosen president of the Constitutional party. He tried continually, but in vain, to bridge the opposition between Tisza and Andrassy. He died on Aug. 16 1915. (E. v. W.)

SZILAGYI, DESIDER (1840–1901), Hungarian statesman and jurist, was born at Nagyvarad (Grosswardein) on April 1 1840. He studied law at Budapest, Vienna, and in Germany, and early attracted attention by his articles on law and politics. As head of a section in the Hungarian Ministry of Justice he travelled on a commission from the Government to England to study there the conditions of the administration of justice, of which he had a knowledge then equalled by few. Brought up wholly in Liberal ideas, Szilagyi took a conspicuous part in the codification work of the Ministry of Justice. Deputy in 1871, professor of public law and politics at Budapest University in 1874, he was in 1877 one of the leaders of the Opposition, which, however, he left in 1886. In 1887 he was returned to Parliament by Pozsony (Pressburg) as an independent member. He became Minister of Justice in 1889. From this time to 1894 he directed his efforts principally towards a radical reform of the whole administration of the courts. In 1894 he took a conspicuous part in ecclesiastical legislation, with which his name is permanently connected. Article XXXI. of the Law of Civil Marriage, and articles XXXII. and XXXIII. on the religion of the children and on State registration, were the result of his active coöperation. After the appointment of Baron Banffy, the former president of the Hungarian House of Deputies, as prime minister, Szilagyi was elected president of the House on Jan. 21 1895, which office he retained until 1899. A man of extensive knowledge, spotless character and wide vision, and a brilliant orator, he was one of the most considerable of the Hungarian statesmen of his day. He died on July 3 1901.

See *Szilagyi's Speeches* (4 vols., in Hungarian, Ed. Fayer).

(E. v. W.)

TACNA-ARICA QUESTION.—Among long-standing disputes between states, the question of Tacna-Arica, between Chile and Peru, still remained unsolved in 1921. Its history can be summarized as follows.

The Treaty of Ancon, which, ratified on March 28 1884, put an end to the war of 1879 between Chile and Peru, was carried out in its entirety with the single exception of Clause 3, dealing with the fate of the provinces of Tacna and Arica. In 1881, when Peru first sued for peace, Chile, with an eye to the future safety of her frontiers, demanded the cession of three Peruvian provinces: Tarapacá, Tacna and Arica. The Peruvian Government made no difficulty about the first-named, which passed definitely into Chile's possession; but they refused to consider the cession of the relatively valueless provinces of Tacna and Arica, on the ground that public opinion in Peru would never suffer it. To smooth the way for them Chile offered to purchase the territory in question for the sum, or equivalent, of ten million Peruvian *soles*, but the offer was rejected. The war therefore continued until 1882, when Chile succeeded in occupying the Peruvian capital. Chile again made the cession of Tacna and Arica a *sine qua non* for the signing of the peace treaty. The Peruvian Government's chief concern was to find a way of acceding without grievously wounding the national sentiment. Examples were not lacking in recent European diplomacy of a means of effecting this; France, especially, had had recourse to an expedient wherewith to save appearances and mask important transfers of territory, namely, Nice and Savoy in 1860 (Treaty of Turin), and the island of St. Barthélemy in 1877 (Treaty of Paris). That expedient consisted in inserting in the treaties whereby the territory was ceded a soothing stipulation for a plebiscite, which should decide, at some future date, its definite ownership. Comparison shows that the negotiators of the Treaty of Ancon, in drafting the clause concerning Tacna and Arica, followed closely enough the formulas provided by the Treaties of Turin and Paris. The clause runs as follows:—

> Art. 3. The territory of the provinces of Tacna and Arica, bounded . . . etc., shall continue in the possession of Chile and subject to Chilean legislation and Chilean authorities for the term of ten years, reckoned from the ratification of the present Treaty of Peace. This term having expired a plebiscite shall decide by popular vote whether the territory of the said provinces is to remain definitely under the domain and sovereignty of Chile or continue to form part of Peru's territory. The country in whose favour the provinces of Tacna and Arica shall be annexed shall pay to the other ten million *pesos* in Chilean silver money or in Peruvian *soles* of equal fineness and weight.
>
> A special protocol, which shall be considered an integral part of the present treaty, shall establish the form in which the plebiscite is to take place and the terms and periods in which the ten millions are to be paid by the country which shall remain owner of the provinces of Tacna and Arica.

Chile's contention subsequently was that this clause was inserted solely in order to allay Peruvian national resentment and so to make possible the conclusion of peace; that the plebiscite to which it refers was to be carried out under such conditions as to render inevitable the definite annexation of Tacna and Arica, upon which Chile had insisted from the first; that the sole purpose of the stipulated lapse of 10 years before the plebiscite should be held was to give the Peruvian people time to accustom themselves to Chilean rule, and that the sum of 10 million *soles* which would be paid by Chile was meant as compensation for the cession. Peru, on the other hand, maintained that the plebiscite clauses introduced into such treaties as those of Turin and Paris had not the disguised intention that Chile claimed, and that, even supposing they had, the plebiscite called for in the Treaty of Ancon was of a very different nature.

The period of 10 years had not expired before Peru took steps to secure the holding of the plebiscite, proposing conditions, which, as they included the restriction of the vote to the Peruvians born in the two provinces, proved unacceptable to Chile. Several years of fruitless negotiation ensued, and in 1901 Peru severed diplomatic relations. Four years later she accepted Chile's invitation to renew their intercourse, and to seek with her neighbour an agreement based upon the interests and convenience of the two republics; but the Peruvian plenipotentiary, on his arrival at Santiago, made it clear that his Government desired no other agreement than such as would forward the carrying-out of the plebiscite under the same conditions proposed previously, and diplomatic relations were again broken off.

Notwithstanding her contentions as to the purely accommodatory nature of the clause in dispute, Chile always declared her willingness that the plebiscite should be held, provided the suffrage were not limited to Peruvians but extended to all the adult inhabitants of the provinces, including foreigners resident therein since a certain date, who could read and write; and that a representative of Chile, as the nation exercising sovereignty over the territory, should preside over the commission controlling the proceedings. For her part, Peru insisted that the 10 years stipulated for the holding of the plebiscite was a *maximum* period, and that since its expiry in 1894 Chile no longer exercised such sovereignty *de jure*, and could not therefore justly claim to preside. Chile, on the contrary, held that the term was intended as a *minimum* period.

Diplomatic intercourse having been resumed, Chile, in 1910, made definite proposals for the holding of the plebiscite in accordance with her contentions. Peru refused, and once more broke off relations.

In 1920 Peru made formal request for the revision of the Treaty of Ancon by the 1921 Assembly of the League of Nations, but later withdrew her demand, reserving the right to renew it at a future Assembly. The problem of Tacna and Arica stood in 1921 therefore in much the same position as at any time subsequent to the Treaty of Ancon, though towards the end of the year suggestions for arbitration were again under discussion. The area of the territory in dispute was only 23,306 sq. km., and only 18,000 ac. were in 1921 under cultivation. The pop. numbered no more than 37,000, and the trade and industry were almost negligible. Nor were any ethnical, linguistic or religious considerations involved, the inhabitants, whether Chilean or Peruvian, being of the same race, speaking the same language and professing the same faith.

TACTICS[1] (*see* 26.347*).—While personal reminiscences of the Great War had up to 1921 appeared in plenty, and in many languages, it is remarkable that so far no comprehensive and scientific study of its abiding tactical lessons had been published. Diarists and biographers there had been; also not a few training-manuals and text-books; but the world was still awaiting the Clausewitz or Henderson who would show it how military science developed from 1914 to 1918 in the minds of great leaders, how the world struggle differed from anything and everything that preceded it, and how it was finally lost and won. This is the task which will eventually confront the true biographer of Marshal Foch, the greatest soldier figure of the war, when it becomes possible to follow his innermost thoughts during the progress of the conflict. The future historian will have to show how principles and theories which had been developed during a lifetime of profound study were abandoned, modified or confirmed as the result of experience of modern war, contact with the military chiefs of Allied nations and bitter contest with the best military brains Germany and Austria could produce. When some skilled military writer shall have interpreted Marshal Foch as G. F. R. Henderson interpreted Lee and Stonewall Jackson, it may be possible not only to understand the Allied victory but perhaps even to penetrate into the future and to realize some of the simpler problems which war on the great scale has in store. That is the best the military historian can hope to do—so to present the picture of the past as to throw some light upon the obscurity of the future. Always we are left groping our way through what is at the best semi-darkness, but any ray of light is helpful. It is in this spirit and with full consciousness of the difficulties and dangers which lie ahead that the present writer attempts here the task of reviewing the practical developments of the decade 1910–20 and of presenting them in a form which in 1921–2 might already be out of date.

---

[1] This article may be considered also as supplementing, for the World War, the article STRATEGY (25.986).

* *These figures indicate the volume and page number of the previous article.*

I.—TACTICS IN THE WORLD WAR

Tactics and Strategy.—First it may be as well to inquire exactly what is meant by tactics, and whether the division between strategy and tactics is left as clear as it was before the World War introduced the new feature of continuous lines offering no flanks for attack, and ceaseless fighting which, from day to day and month to month, varied only in intensity.

Let us ask two questions: (*a*) Can grand or combined tactics still be defined as the sphere of the higher commander on the day of battle? and (*b*) if so, can we accept the corollary that all the fighting on the western front from 1915 until 1918 was tactical and outside the sphere of strategy? All days were battle days; but does this mean that the problems which the commanders of the British, French and Italian armies in the field were called upon to solve were essentially tactical in their nature? The definition may require some modification, but to the second question the answer is distinctly "Yes." They were vast problems involving all sorts of considerations, but they were essentially *tactical*. Questions of strategy, so far as Britain was concerned, were dealt with in London, or in conference with her Allies in Paris, Rome or elsewhere. It was in these places and not in the field that great decisions were formed as to the despatch of troops to the various theatres of war, the formation of new forces, and the wisdom, or the reverse, of embarking upon fresh undertakings. Behind them all were the equally anxious problems of finance and allotment of man-power. In modern wars, Army, Navy (in which is included the Merchant Marine) and Munitions are only three departments of the nation; each puts forward its rival claims, which can only be judged by the Government in consultation with the technical advisers. And so it is that, as war absorbs into itself more and more of a nation's energies and resources, the Government with the prime minister at its head must accept responsibility for *strategy* in the highest possible sense of the word. In no sense, however, can the Government be held to be responsible for *tactics*, which are the exclusive sphere of the military commanders. The Government, in consultation with their technical advisers, allot troops; soldiers alone command them. Whether that command, in its turn, gives scope for *strategy*, as in Palestine, or only for *grand tactics*, as on the western front, depends upon the number of men available in proportion to the size of the theatre of war, upon the railway and road development of the theatre of operations, and upon many other considerations.

Strategy, now as always, is the art of bringing the enemy to battle on terms which are disadvantageous to him; *grand tactics* are the methods employed for his destruction by a force of all arms. Before the war, when aviation was still in its infancy, the term "all arms" included as a rule no more than infantry, artillery and cavalry. Even the engineers were rarely considered as having any direct influence upon the result of a battle. All this is changed, and to the four arms there must now be added, without any doubt, aeroplanes and tanks, and it is a matter for the gravest consideration whether in future wars the chemist will not occupy as important a position as he now does in peace. Machine-guns are purposely excluded here, not because their importance is underrated, but merely in the hope of avoiding unnecessary complication and because they may be included in the wide term of infantry, which also covers such accessories as bombs and rifle grenades.

The sphere of the higher commander in battle is therefore by so much enlarged in that he must know how to utilize and combine far more weapons than were at his disposal in earlier wars, and the demands made upon him are in the same degree heavier and more complex. And so through all the long chain of command, from "the Chief" at G.H.Q. to the platoon commander in the foremost trench. It has been amply proved that, more than ever, no arm of the service is complete in itself; each requires in a greater or less degree the assistance of others in order to win even a small success. The smallest raid into a German trench needed hours, almost days, of careful preparation: night patrols and aeroplane photographs for reconnaissance; artillery and trench mortars to destroy the enemy's wire; if the ground won is to be held engineers must help to make it good, and even if it is not to be held the engineers must be called upon to destroy with explosives enemy machine-gun emplacements or other defences. Then, according to the object of the raid and the intentions of the commander, arrangements must be made for the withdrawal or reinforcement of the raiding party, all of which require most thorough and careful forethought. Much of the detailed preparation for a minor operation of this kind will fall upon company and platoon commanders; and when it is remembered that in war platoons may be, and often are, commanded by junior non-commissioned officers, it is seen that, just as responsibility for the success of higher strategy must depend upon the wisdom of the prime minister and the Government, so responsibility for tactical success extends to the last link in the chain of military command.

War has become national in a sense in which it never was before, and it is a sad reflection that, after twenty centuries of Christianity, its study is more important than ever. Owing to the insular position of Great Britain, its dense population and consequent dependence upon overseas trade, it, more than any other country, is dependent upon success in war. No country in the world could so ill support defeat; yet in no country is the study of war so much neglected. There has recently been a most praiseworthy effort to train the British soldier in the arts of peace; it might be well if similar efforts could be made to fit the civil population in all classes of society for the vital responsibilities of war. The response to Lord Kitchener's appeal in 1914–5 proved beyond doubt the essential soundness of the national spirit; but the story of a hundred battles proves that spirit without professional knowledge and skill is desperately expensive in life.

Hence it is that, just as our conception of war has become national and the need of study more general and less strictly professional, so our definition must be less restricted. We prefer to regard tactics, even "combined tactics," simply as the art of commanding troops in action, without any limitation as to the number of troops employed or the status of the commander. Indeed, it is perhaps easier, in considering the fighting in France and Belgium, to exclude the rôle of the commander-in-chief than that of many of his junior subordinates. Nevertheless, for the purpose of this article, we shall be concerned entirely with the sphere of the larger formations, with organization and equipment, with the effect of inventions upon attack and defence, and with the changes and developments in tactics since Russia and Japan fought themselves to a standstill in the plains and highlands of Manchuria.

Communications.—Now, these changes have been brought about by exactly the causes which have produced the whole evolution of tactics during the last two thousand years, namely, improvement in weapons and communications—that is, in conveying ever more men to the field of battle and in furnishing them with ever more efficient means of killing when they get there. For, after all, the object of tactics is to kill; if possible without being killed, but in any case to kill. For the first time in history these developments enabled armies during the World War to be placed and maintained in positions which offered no flanks for attack and therefore afforded no scope for strategy or for manœuvre. Increase of population was a contributory cause, but primarily the "continuous lines" extending from sea to sea were rendered possible only by the development of railway and road communications, and by firearms of marvellous range, rapidity and precision. It was these features, existing so far only in Europe, and attaining their fullest influence only in western Europe, which differentiated the World War from everything which preceded it. Something of the same kind was seen during the Russo-Japanese War, when great mountain ranges made movement far from the railway extremely difficult, with the result that, broadly speaking, neither Oyama nor Kuropatkin had room for manœuvre, and tactically the war resolved itself into a series of frontal assaults on a defended defile. So it was that, from 1914 to 1918, commanders on the western European front had no opportunity for crushing strokes and striking victories like Austerlitz, Rossbach or Salamanca. Their genius had to show itself rather in the skill and ingenuity with which they made use of the resources placed at their disposal by modern science, than in rapidity of movement and dashing leadership. More than ever war has become "an art served by many sciences," but in so doing it has lost much of its romance. It was only as they moved eastward out of Europe to Palestine and Mesopotamia, where restricted railway communications and scanty populations made it necessary to operate with comparatively small forces in big countries, that the British commanders found themselves working under conditions which previous experience had made familiar to them. Before 1914 instances of the tactical use of railways could be numbered on the fingers of one hand; the arrival of the ever-famous Stonewall brigade on the battlefield of Bull Run, the dramatic appearance of Lambton's naval brigade at Ladysmith on the morning of Oct. 30 1899 at a critical moment in the action of Lombard's Kop, and one or two other examples complete the tale of occasions when railways can fairly be said to have had a direct influence upon a tactical decision.

All this is now changed. Broad-gauge and light-gauge lines are now a necessary and ever-increasing part of the mysterious machinery of battle; and it is they, together with the complementary service of road transport, that have made it possible to mobilize the entire manhood—almost the whole adult population —of a nation, and to maintain in the field armies numbering several millions of men. These armies in their turn claim the services of every industry and every factory to such an extent that in time of war the term "civilian population" is merely misleading, and undefended towns and ordinary merchant vessels become legitimate objects of attack. Thus it is that the new feature of "continuous lines" has been introduced into civilized war, and frontal attacks have become inevitable.

Obstacles: Wire.—Here, however, we must stop to consider another new factor which has resulted directly from the extended use of railway communications and the "nationalization" of war. This is the use of obstacles, more particularly of wire. For several years before 1914 it had been amply evident to every student of the great military problem of Europe that, so soon as the German armies were mobilized and received the order to march, every road between the Dutch frontier and the mountains of Switzerland would be filled to overflowing with advancing troops. There was, be it noted, no doubt whatever among competent soldiers that Germany would not hesitate to violate the neutrality of Belgium; indeed, the very size of her armies, as well as her declared principle of envelopment, made it certain that she would do so, even had the fortifications of the eastern frontier of France not barred the way from Alsace and Lorraine to Paris. To this extent, therefore, "continuous lines" had been foreseen, but it was generally considered that they would exist only during the opening phase.

The present writer can recall very clearly an interesting argument between a very distinguished senior officer and two of his subordinates which took place early in 1914. The senior officer maintained that he found it impossible to visualize a collision along a front of something like 140 miles. The two subordinates maintained that this gigantic battle must be the result of the numbers which would certainly be mobilized; clearly it could not last very long before it broke up into groups of armies operating semi-independently, but, taking Mukden as something of a guide, they expected to see the first, and perhaps the decisive, battle rage from Belfort to the neighbourhood of Namur for perhaps three weeks. "Well," was the senior officer's final remark, "I'll give you three weeks, but not a day longer," and with that the juniors departed content. Some things, it will be seen, turned out as anticipated; but many, especially the rapidity of the Allied retreat, turned out very differently. On the one hand, the German movement through Belgium was too quick and too successful to allow the Allied armies to make the expected stand; on the other hand, the continuous lines were never broken, and after three months of moving warfare the *siege of Germany* began. Once started, it lasted, not for three weeks, but for four whole years—a phenomenon which was due to field fortifications and, more than anything else, to wire.

It is a remarkable fact that in all the tactical exercises, staff rides and other instructional devices in which soldiers were accustomed to indulge before the war, the problem of field fortification was but lightly considered. This is true of all countries, and it is quite wrong to believe that Germany, as has been held in too many quarters, showed any greater prescience than her enemies. The reasons are simple: first, it was not possible to test the efficacy of trenches, dug-outs, barbed-wire entanglements or "pill-boxes" under manœuvre conditions, when time was short and compensation a grave consideration; secondly, it was generally agreed that fortified positions limited the offensive power of the defending garrison and could themselves be easily avoided or turned. This was the teaching of the South African and all previous campaigns, and even Manchuria gave but little indication of what war was to be like in the highly industrialized areas of western Europe. Thus it was that, at the end of the first battle of Ypres, in the middle of November 1914, the British, French and German armies found themselves confronted with entirely novel tactical conditions which demanded entirely new tactical treatment; and to-day new tactics involve not only the training of troops but also the application of mechanical device. In 1914 the new conditions were those of "continuous lines," for which the solution was eventually found, but only through a weary process of "trial and error," in the course of which the ultimate victors came perilously near to exhaustion.

It is not proposed here to discuss the various methods which were adopted with a view to avoiding the central problem and seeking a decision in other theatres of war, for they have nothing to do with tactics. It is, however, permissible to refer to the effect of operations in different theatres of war upon the tactical evolution in the armies of the Allies and of the Central Powers.

Interior Lines.—Put quite briefly, it would appear to be this —that, as a result of their central position and possession of *interior lines* facilitating the rapid transfer of troops from one theatre of operations to another, the German commanders were not so free to concentrate their attention upon the demands of local conditions as were the French and especially the British. The theatres of Mesopotamia, Gallipoli and later of Salonika and Palestine were so remote from France and from each other that it was less difficult to allot to each the necessary proportion of the different arms, and to give to each the distinct training and equipment essential for its efficiency, than it was for Germany, whose troops and commanders were constantly on the move from one theatre to another. Hence it was that, while Germany was inclined, or compelled, to compromise, the Allies opposed to her were able to specialize, with the result that, with one notable exception, in every theatre the initiative and the lead in tactical development were with them. That notable exception was the not very noble or praiseworthy one of the use of gas. In the true realm of tactics it may fairly be said that, from the end of 1914 until March 1918, when Ludendorff had for the first time been able to devote his undivided attention to the problems of the western front, the lead in tactical evolution was always with the Entente armies.

Changes in Organization.—To return to the deadlock in the West, it became clear towards the end of 1914 and beginning of 1915 that the problem of field fortification could not be solved by the methods of 1870, S. Africa or Manchuria. It was not that principles were changed and theories at fault. The power of modern rifle fire had been amply demonstrated, especially by the British Expeditionary Force, whose trust in their weapons had been more than justified; the French seventy-five, the British long-range field gun (for as such the 60-pounder must be regarded), and indeed the German heavy howitzers had done all that had been expected of them, but one and all failed to compete successfully with the new factor. Infantry, even with the best available artillery support, could not be expected to assault with success the hostile lines, which were daily becoming stronger; and cavalry, which had been invaluable during the retreat of Aug. and the early days of Sept. 1914, as well as in the subsequent advance, could find no scope when Nov. and Dec. came. No vulnerable flank was offered, nor was there the slightest opportunity for those daring raids against the hostile communications which have sometimes offered such dangerous attraction to the cavalry leader. The conditions were indeed the exact opposite of those in S. Africa during 1899–1902. Similarly, the German army had been able to prove that the theory of tactical envelopment was the inevitable corollary of machine-guns and quick-firing artillery, for frontal attack was far too costly, and Joffre and French and their lieutenants had once more proved to the world that counter-attack was the soul of successful defence. It was not that the principles or theories were wrong; so far as they went they were correct enough, but the trouble was that they did not carry sufficiently far. Their basis was manœuvre, and suddenly it was found that manœuvre was no longer possible, but that it had been displaced by the tedious processes of siege warfare. Infantry was still the conquering arm, but was now less dependent upon cavalry, and even more dependent upon engineers and artillery; while the Air Force was rapidly acquiring an importance which, though foreseen, had in peace always been put aside by considerations of expense. It was at this stage, too, that the bomb first made its reappearance as an infantry weapon, and its use increased to such an extent that, towards the end of the battle of the Somme, in the autumn of 1916, it threatened to supersede the rifle. Many new auxiliary services grew up, many new weapons were invented, and leading men in every branch of science devoted their great talents to the destructive art of war.

Yet amidst so much which was new the great central problem of war remained unchanged, for it was, as it always has been, the destruction of the enemy's field army. In the new conditions which had arisen this meant great innovations in army organization. The cry was for more technical troops of all kinds. A third field company (engineers) and a pioneer battalion were added to each British division; the signal service was greatly extended, and, above all, the demand for more and heavier artillery was urgent. Every month, almost every week, new needs were discovered and fresh demands from the armies in the field were reaching the British authorities at home, who were already more than fully employed in equipping Territorial divisions and in raising new armies. Put quite broadly, however, the problem of the capture of the German fortified lines, which could not be turned, was one of improved material and improved coöperation between artillery and infantry, each with the attendant services necessary to efficiency. That is the main thesis to which it will be necessary to return again and again.

Artillery and Infantry Coöperation.—At this point it will be as well to look backward and to trace very briefly the history of the evolution of artillery and infantry coöperation for the previous twenty years or so. It is the story of the contest between artillery and field fortification, which in some respects resembles that between the gun and armour at sea, or between ships and forts. It is, in fact, the old contest between attack and defence. For many years before the S. African War it was an accepted axiom of combined tactics that any attack by infantry must be preceded by an artillery bombardment, of which the principal purpose was partly to overcome the enemy's artillery and partly to shake the *moral* of his infantry. Accustomed as we have become during the last few years to think of guns at least in hundreds, it seems strange to turn to the official account of the battle of Magersfontein (1899) and to read that at 4.30 P.M., on the day preceding the attack which was to take place at dawn, the British force opened fire with one 4·7 gun, one battery of howitzers and three of field artillery, which "shelled Magersfontein Hill for two hours. . . . Though his guns had provoked no reply from the Boer, Lord Methuen felt confident that they had not only inflicted loss, but had produced considerable moral effect upon the Boer commander. This, however, was not the case. The fire had but one important result, that of warning the enemy that an attack was imminent." The fact was that in those days military science overestimated the powers of a few guns and underestimated those of hastily constructed entrenchments, which were then in their infancy and almost an unconsidered feature of war. Again and again the same thing occurred, but so difficult is it to learn from any experience but one's own that we find the Japanese army making exactly the same mistake some four years later. Then, at the action of Ta-shih-chiao, the Japanese, with a vastly stronger artillery than the British had possessed at Magersfontein, bombarded the Russian right for several hours. So heavy was the fire on this occasion that General Stakelberg declined to occupy his trenches, and reported to his senior officer that, should he be forced to do so in order to repel an infantry attack, he would certainly suffer very heavy loss. But no infantry attack developed, Stakelberg's troops remained under cover, and the losses inflicted by the bombardment were almost negligible. From these and many similar experiences the theory was deduced that, in order to get results from the fire of the guns, the artillery bombardment must be accompanied by an infantry attack. To coöperate successfully, the action of the two arms must be simultaneous instead of successive, for only in this way could the enemy be compelled to man his defences, to show himself above his parapets, and to expose himself to shrapnel fire. In the words of the French regulations of 1913: "Artillery no longer *prepares* the infantry attack, but *supports* it." The old term, "artillery preparation," belonged to a dead language.

Such, in a few words, was the generally accepted theory of infantry and artillery coöperation at the beginning of the World War, and during the earlier stages it proved to be remarkably correct. It was not until the field armies found themselves brought up short by deep trenches protected by wire entanglements, furnished with strong revetment, and strengthened by dug-outs, that the experts discovered that, curiously enough, new conditions must be met by old methods, and the discarded, not to say discredited, "artillery preparation" was revived.

Up to this point, too, it may be fairly claimed that the actual artillery material with which the various armies took the field in the autumn of 1914 had stood the test well, although naturally subjected to the restrictions on ground of expense which are inevitable in times of peace. Each artillery, English, French and German, had, however, developed on somewhat different lines, corresponding to the mentality of the different nations, their theories of battle fighting and the amount of money available for each experiment. Each of the three armies had a mobile field gun, England the 18-pounder, France her famous 75-millimetre and Germany the 77. France, thinking always of rapid movement either in retreat or advance, and always refusing to consider the possibility of standing on the defensive, had concentrated on the light, rapid-firing and very accurate field gun, with an organization on a divisional basis. England also believed in the divisional organization, but in addition to the 18-pdr. she had the 4·5-in. howitzer for high-angle fire, which had been found so necessary in S. Africa, and the 60-pdr., whose long range, commanding the roads and often forcing premature deployment of the German infantry, was invaluable during the retreat. The German army alone possessed heavy howitzers and high explosive, no doubt because the general staff always considered the possibility of being forced to engage permanent fortifications on the French and Belgian frontiers, but it was weak exactly in those points upon which the French and English had specialized. The 77-mm. was inferior as a field gun both to the 75-mm. and to the 18-pdr.; it possessed nothing corresponding to the 4·5-in. howitzer; and its heavy artillery, while possessing great shell power, was lacking in range. Thus it came about that, when expense was no longer a ruling factor, each army began to borrow ideas from the other and to adopt material suitable to the wearisome ordeal of trench warfare. Thus, too, Europe stumbled into that war of material, of ever stronger material of defence and ever stronger material of attack, which was to last until the autumn of 1918. It was under these conditions that the German army, which was to have been back in its own homes "by the fall of the leaf," found itself pinned to French and Belgian soil, and that the war, which at the outset, as was believed by most of the leading authorities in England, political, military and financial, could not last more than six months, dragged out its devastating existence for more than four long years. One man among them alone ventured at that early stage to lay his plans for a long war, Lord Kitchener.

Offensive or Defensive?—It was a depressing situation for the professional soldier of England, France or Germany to find himself in. No matter to which of the three armies he happened to belong, he had been trained from youth in a war of movement, of stroke and counter-stroke, and of rapid decision. The more he knew of the history of his profession, the more deeply he had studied the campaigns of the great captains, the firmer was his belief in the power of the offensive and the "will to conquer." There was much searching of heart, especially among those who had seen the German masses beaten back time after time by the attenuated lines of the British Expeditionary Force in the first battle of Ypres. If the rifle alone could do so much, how was it possible to overcome strong defences heavily protected with barbed wire and bristling with machine-guns? Had modern developments changed not only the methods of warfare but the very basic principles themselves? Had, in fact, the defence become stronger than the attack?

There were those who thought that a decision, since there must be one somehow, must be sought elsewhere than in France or Flanders, and there arose the controversy between "Easterners" and "Westerners," which lasted as long as the war itself. But that great question carries us into the region of strategy. Clearly no commander could be content to sit still and avoid a decision on his own front, at least without direct orders from the supreme authorities. Nevertheless, the same causes which gave birth to the desire to "find a flank" elsewhere than in France produced even on the western front two schools of thought, which were christened by the French, with their wonderful gift for discovering appropriate labels, the "usuristes" and the "trouistes." The former, as their name implies, held that nothing could be gained by hurling infantry, however well supported, against the German lines. In support of this view they were able to point to the desperate losses which were incurred in the fruitless fighting of the early part of 1915, and to the opinion of a captured German officer who, when asked when and how he thought the war would end, was said to have replied: "In about six months' time, and about fifty metres from where we now are." A war of attrition, and victory through exhaustion, or by somebody else's efforts in some other field, were the tenets of the "usuristes." These theories found no appreciable support in the British army, nor in the British troops from overseas or in the Dominions whence they came. The war of attrition was rightly regarded by them as a dangerous "will-o'-the-wisp" which was bound to lead to disaster, for it meant the abandonment of that "will to conquer" which has always been the greatest asset of victorious leaders, and depended for success upon the collapse of the enemy's *moral* rather than upon the triumph of their own. The arguments of the "usuristes" could not be disproved. They could be met by faith alone; but faith was not lacking, and the names which will always be held in the highest honour in every country are those of leaders, whether political or military, who never lost their belief in the power of the offensive and refused to be tempted into the broad and easy path of the "usuristes."

The "trouistes" had their way, and in the end they compelled victory. The principal article of their belief was a firm conviction that morally the defensive is the weaker rôle, and that the path to victory must always lie through a wisely and resolutely conducted offensive. Put shortly, and in axiomatic form, "there is no defence which cannot be broken." The formula was simple, but the proof was only found after three more years of trial and error.

Since the very earliest days of the war the cry in every army had been for more and heavier artillery, with more and heavier shells, and the fighting of the earlier part of 1915 merely emphasized the same need. By Sept. 1915 the French and British armies, no less than the German, had been provided upon a scale never before dreamt of, but yet far below that which was to be reached before the war was over. Side by side with this vast expansion went the increase of the signal corps, for without coöperation between the arms it was clearly useless to expect the full value from either. Before the war, both in France and England, this subject of coöperation had received great attention. It formed the subject of countless essays, lectures and articles in technical magazines. All that was lacking was practical application and testing under service conditions. Probably the Signal Service which took the field with the British Expeditionary Force excelled both the French and the German, but it depended largely upon despatch-riders, admirable in a war of movement but of less use on a modern battle field. In the words of a French writer: "Il eût mieux valu quelques harangues de moins sur la liaison, sur l'union des coeurs d'artilleurs et de fantassins, et quelques kilomètres de plus de fil téléphonique." But telephone wire costs money, and its absence is just one of those difficulties with which every army must expect to be faced at the beginning of a great war. By Sept. 1915, however, the Signal Service, the link between infantry and artillery, was well equipped; but, in the absence of practical experience, its possibilities and limitations were not yet realized. In this direction, as in many others, much was still to be learnt.

First Great French Attack.—Material equipment was provided lavishly and the first of the great attempts to burst through the enemy's lines was eventually fixed for Sept. 25 1915. At that date much of the British army was still new and inexperienced, so the main attack was delivered entirely by the French in the Champagne country. Farther to the north subsidiary attacks were launched both by the French and the British, but with them we are not concerned. Already the old formula: "The artillery does not prepare the attack, but supports it," had been so far abandoned that three days were devoted to the destruction of enemy's defences by guns of every calibre, and these had themselves been preceded by several days of counter-battery work; thus was seen the revival of the old discredited "artillery duel," which cannot fail to interest the eventual historian of tactical evolution.

It is clear that an attack which is thus prepared has one grave weakness. The exact time, and even the day, of the infantry assault may be concealed from the enemy unless he is sufficiently fortunate to capture a prisoner who knows and can be persuaded to part with the secret, but there is nothing of the rapid march followed by the speedy onslaught and crushing blow of a Lee or a Stonewall Jackson. On the contrary, the attack is not only faced by astonishingly strong defences but is at the same time deprived of what is perhaps its principal weapon—surprise. Some efforts were, of course, made to conceal the exact area selected for the main attack by carrying out similar bombardments on other parts of the front, but the vast amount of ammunition necessary for a real destruction of wire defences and dug-outs rendered it impossible to carry out a thorough preparation at more than one or two points. Thus it came about that the element of surprise was lacking, and the attack was to this extent weakened. Nevertheless in the initial stages it was almost completely successful. The hostile front was broken on a front of 15 miles, and some 20,000 prisoners were taken, together with about 100 guns.

Great hopes were raised momentarily, not only on the fighting front but in London and in Paris. But these hopes were sadly dashed, for it was quickly discovered that, after all, the real difficulty for the assaulting troops was not the capture of the enemy's organized first-line defences, formidable and almost impregnable though they had hitherto appeared to be, but the exploitation of success. So soon as the great attack had been launched there was no longer any doubt as to the exact point or points at which the German reserves were required, and as the attack began to lose its energy and vigour the defence grew stronger. The assaulting infantry found itself in a comparatively narrow salient, exposed to a cross fire of artillery from both flanks, and checked in front by machine-guns which could not be hastily located. It was just at this moment that the infantry found that its own artillery support was weakened, for guns were trying to move forward to new positions and were at the same time struggling against perhaps their greatest difficulty, namely, ignorance as to the exact position of their own infantry. As the days passed the defence steadily grew stronger, until at last the attack withered away and finally ceased altogether towards the end of the first week in October. When the time came to reckon up gains and losses it was found that against a gain of some 40 square kilometres of ground, 30,000 prisoners and more than 100 guns, the French army had put a loss of 120,000 killed or missing and 260,000 wounded. The German loss was probably not much less.

The stories of the various subsidiary attacks were not very different from that of the principal French effort. There had been no break-through, but much had been learnt. In the first place it had been proved that the attack was still stronger than the defence, for the leading infantry had passed through the German lines with surprising ease, and there was a general feeling that at several points, notably at Loos, the Allies might well have won greater success than that which actually came to them. There was, therefore, reasonable ground for the feeling that, notwithstanding bitter disappointment, the advocates of the "break-through" had been justified, and that, with the experience that had been gained, success would certainly be achieved "next time."

New Tactical Lessons.—The causes of failure may be summed up thus: (*a*) the attacks were made on too narrow fronts; (*b*) there was no surprise; (*c*) communication between infantry and artillery was not satisfactory. So far as the first of these causes of failure was concerned, it was evident that it could be remedied by allotting more men to the attack, and that in turn developed itself into the more or less mechanical question of the provision of more guns and ammunition. The second cause was more difficult, since, as has already been seen, surprise and prolonged bombardment cannot well be reconciled. One or the other must be sacrificed. The third cause of failure led to a very definite step in infantry and artillery tactics, and to the evolution of ideas which were put into practice for the first time in the fighting on the Somme in 1916.

As has been seen, it had already been found necessary to abandon the idea, formed in S. Africa, that "artillery does not prepare the infantry attack," and it had been realized that an adequate artillery would have had no difficulty in dealing with the Boer defences. The fault, after all, had not been in the older theories of attack, but in the British army having tried to carry them into effect with insufficient material. Had, for instance, Lord Roberts's army in Feb. 1900 been provided with heavy and light guns on the 1915 scale, Cronje's defence at Paardeberg could not have lasted six hours, and the costly infantry attacks would have been entirely superfluous. Clearly the fault had not been in the theory of an artillery preparation, which had now been proved to be so completely indispensable that it was necessary not only against the first system of defences but also against the less elaborate lines in rear. How to secure this cöoperation against the second and third lines of defence was in Sept. 1915 the latest of tactical problems. The solution then adopted was that the guns must lengthen range or attack new targets *at the request of the infantry.* Such was the training and instruction of 1915, and it was only when put to the test of actual fighting that it was discovered that no system of communication which the wit of man had yet devised was sufficiently good and sufficiently reliable to keep artillery fully informed of the requirements of the infantry; nor was the artillery always able, for various reasons, to do exactly what the infantry wanted, even when fully informed. It was out of the confusion and disappointments of Champagne and Loos that the theory of *methodical progress with limited objectives* was eventually evolved and put into practice in the Somme fighting of 1916.

The experience of the first two years, or, more accurately, twenty-two months of the war was brilliantly summarized in a memorandum on the attack, dated June 20 1916,[1] over the signature of Marshal Foch, then general commanding the northern group of the French armies. Later experience, no doubt, caused further modification of views, but this document is invaluable as showing the stage which had been reached by the best military thought of the day; for it is in every way worthy of the great reputation which the author had already won for himself as a writer and as a student of war no less than as a great commander in the field. No excuse is needed for quoting some of the more important passages.

In the first place it is assumed as a reasonable basis for consideration that the German defensive organization will consist in a series of prepared positions, of which two will be complete, while the others will be more or less skeleton, but sufficiently advanced to be quickly made tenable.

> "Against such defensive organizations and against an adversary who is perfectly protected, infantry is incapable of preparing an attack with rifles and machine guns, just as fire power prohibits all action by 'cold steel.' For these reasons infantry has lost its offensive power in the actual battle. Guns alone can destroy the enemy's defences, upset his organization, kill or annihilate the defenders and master his artillery.
>
> "In consequence, the rôle of the infantry is limited to seizing and occupying the ground over which the artillery has wrought effective and complete destruction."

In another part of the same paper the marshal says:—

> "In such conditions the attack of every position entails two phases: (1) the destruction of the defences, or the artillery preparation; (2) effective occupation by the infantry (*de vive force*). Experience has shown that when the destruction by the artillery has been effective the advance of the infantry is easy and cheap in human life. When the destruction has been but partial or not thorough, infantry is completely checked"
>
> "Artillery preparation is clearly the measure of infantry possibility. It must be resumed the moment the advance is checked. The *depth of ground shelled by the artillery decides the area which can be allotted for conquest by the infantry. It is not great—two, three or four kilometres.*"[2]

From these hypotheses it follows logically that each successive position requires fresh reconnaissance, fresh bombardment and a fresh infantry assault. Infantry, however, by virtue of its own fire-power, is more than ever able to resist counter-attack.

These new theories may be summed up in the words of another high authority: "Artillery conquers defences, infantry occupies them." What a complete change two years of war had brought about from that other phrase: "The artillery does not prepare the infantry attack, but supports it"! Yet be it noted that the latter was also the direct result of war experience.

A further example of the leading position which artillery had by this time attained is seen in the rapid elaboration of the "creeping barrage." It will be remembered that during the Champagne fighting, artillery altered range or changed its targets "at the request of the infantry." This system had proved unworkable in actual practice, and for it was gradually substituted a new plan by which infantry and artillery worked together in accordance with a carefully prepared time-table. It is only necessary here to record the fact that for the first time infantry movements conformed to artillery fire, although it is also true to say that the artillery "lifts" were based upon the speed at which it was calculated that infantry could move. It is also noteworthy that, as the idea of moving close up to the wall of bursting shell, whether shrapnel or high-explosive, became more familiar to the infantry, the artillery "lifts" were reduced and the rate of progress became slower. Such tactics required no mean degree of confidence in the infantry and a high standard of accuracy in guns and ammunition as well as of training in gun-crews. Some casualties from the barrage fire were unavoidable, but it was found far safer for infantry to run the risk of an occasional short burst than to let the barrage run away from them, leaving them exposed to enemy machine-guns.

---

[1] It will be noted that this memorandum was issued only a few days before the opening of the Somme offensive.

[2] The italics are ours.

Two other points in connexion with the Somme battle are especially worth noting. First, several attempts were made to operate on a really large scale by night, and on one occasion at least considerable success was won. Secondly, tanks made their first appearance, an event of real historic importance.

Nevertheless it must be admitted that 1916 brought the Allies little if any nearer to the longed-for "break-through" than had 1915, and largely for the same reasons. Again it was evident that prolonged bombardment was the enemy of surprise. Again it had been found that the first system of defence was far less difficult to deal with than were the less well-organized and comparatively ill-defined lines in rear. In addition it was discovered that the shell-torn ground opposed a formidable obstacle to the movements of the attacking infantry, while every hole was a ready-made emplacement for a German machine gun.[1] Great things had indeed been achieved both by the British and the French armies but the enemy was not crushed, and after months of fighting on an unprecedented scale he still preserved an unbroken front from the English Channel to the Swiss mountains. This time the explanation was held to be that, after all, the system of limited objectives was wrong, for the delay necessitated by the methodic preparation for each successive attack merely permitted the enemy to recover from the previous reverse, to bring up reserves of infantry and artillery, and to organize a fresh defence. Thus at each stage of the battle the defence grew stronger, and the attack weakened until it at last died from exhaustion. From this premise it followed that if real success was to be won the artillery preparation must be heavier than ever but in greater depth, and the infantry must pass through all the successive lines of defence in one irresistible rush. Such was the teaching of the French official instructions of Dec. 1916 which prepared the ground for Gen. Nivelle's disastrous attack in April 1917.

Lessons of 1917.—Unlike its predecessors, the campaign of 1917 was singularly unfruitful in tactical ideas. Partly owing to insufficient preparation, partly to over-confidence and partly to want of secrecy—for it was commonly reported that every flower-seller in Paris knew exactly what was intended—the great French offensive by the IV., V. and VI. Armies met with a severe reverse. The subsidiary attack by the British I., III. and V. Armies was more successful, but again resistance was found more difficult to overcome as the attack progressed, and the operations were finally abandoned when it became evident that the main attack, from which so much had been hoped and expected, could not attain its object.

The principal scene of operations then became the Ypres area. First the capture of the Messines ridge, and then the prolonged attack, in appalling weather and on a narrow front, against the Passchendaele ridge. As had happened on every previous occasion, the first system of enemy defences fell easily enough,[2] but difficulties increased just when, theoretically, they should have been most easy to overcome. The artillery "preparation," on a scale far greater even than in the Arras battle of April, did its work only too well, for, coupled with the heavy rains, it converted a naturally swampy country into a pock-marked morass, intensifying in a high degree the troubles of the infantry, and greatly curtailing the usefulness of the tanks, which were by this time an important new arm of offense. During this period, too, the use of gas, especially the newly discovered "mustard" variety, became more persistent and more general than ever before. Masks were worn for hours on end, and so impregnated did the soil become that many men suffered merely from sitting or lying down to rest. Never has any army fought under greater disadvantages than did the British during the autumn of 1917, yet, even if it did not do what was hoped from it, it is only necessary to read Ludendorff's account to realize how heavy was the strain upon the German resources. Moreover, under the leadership of Hindenburg and Ludendorff, the defensive strategy and tactics of the German army had been radically overhauled during the winter of 1916–7, and the *moral* of the troops had been wonderfully improved. Indeed, the army which held the French on the Aisne, the British at Arras and the combined Allies round Ypres was altogether different in spirit from that which had been hunted back to the Hindenburg line during the previous winter. Even the air service responded to the new spirit, and the Entente troops no longer enjoyed the immunity from bomb attacks which had been theirs throughout 1916; far from it. Such was the effect of the masterful and trusted leadership which now had control of the German army.

Tactically, the principal change brought about by the new régime was a greater elasticity in defence, which aimed at affording as ill-defined a target as possible to the attacking artillery and the vaguest possible objective to the assaulting waves of infantry. In reserve were held certain battalions whose duty it was to advance to the counter-attack as soon as it was known that an attack had been launched, and thus it came about that more than once infantry which was in process of organization and consolidation after a successful attack found itself thrown upon the defensive and perhaps forced back from a position which had been dearly won. Special aeroplanes were detailed to look out for these counter-movements, and special batteries to deal with them, sometimes by putting down a defensive barrage of gas, and from these small beginnings grew up that war of movement which gradually reasserted itself and increased in intensity until at last the war was lost and won. More and more as the great attacks, whether French, British or combined, failed to win a decisive result, it was realized that in some way or another the element of surprise must be reintroduced, for without it the offensive was deprived of almost half its power. But the question was, How could the enemy defences be overcome without the preliminary bombardment which inevitably "gave away" the assailant's intended plans? The solution of the problem was at last found in the use of tanks, and at the battle of Cambrai tanks came into their own.[3] Massed secretly by night conveniently near the objective, and advancing when the time came under cover of an artillery barrage, but over ground which had not been rendered impassable by tons of heavy shell, the tanks effected a complete surprise, passed line upon line of defences, and enabled supporting infantry to occupy an important area of ground with but little loss. So severe had been the drain upon the German reserves during the Ypres fighting that for some twenty-four hours the British troops were within an ace of really effecting a break-through, and Ludendorff has himself said that if they had been able to push on a little farther they might have broken in upon his communications and so have scored a considerable strategical success. But the drain upon the British reserves had been no less heavy than upon the German, and the necessary weight to turn a tactical victory into a strategical success was just lacking. In the end Ludendorff was able to mass troops for a counter-attack, and some of the ground which had been lost was re-won; but for the Allies by far the most important result of the Cambrai fighting was that the "trouistes" had been able to justify the faith which was in them and to show that there was a way leading to decisive victory—namely the proper coöperation of infantry, tanks and guns. The seed sown at Cambrai bore rich fruit in the campaign of 1918, but before it could do so Ludendorff was to show that, even without tanks, a break-through was not impossible.

The "Break-through" in 1918.—In discussing the first great French effort to break through the German defensive lines, that of 1915 in Champagne, it was shown that there were three important causes of non-success—namely, absence of the element of surprise, unsatisfactory coöperation between infantry and artillery, and the fact that the whole enterprise was on too small a scale. In a brief review of later offensives it has been possible to show how these defects were gradually overcome, how artillery gradually dominated the tactical theories of the day, but at the same time rendered surprise an impossibility, until at Cambrai it seemed that the solution had at last been found. But Cambrai was itself something of an experiment, and on too small a scale to have a really decisive result. As is always the case in war, the armies of the Central Powers had been passing all the time through the same evolutionary stages as those of the Entente. The minds of Hindenburg and Ludendorff were busy with exactly the same tactical problems as those which daily occupied the thoughts of British, French and Italian commanders. After the great failure in front of Verdun in the early part of 1916 there was no German offensive on the Franco-British front until March 1918, but much experience had been gained in the East and in Italy; moreover, there can be no doubt that Ludendorff's penetrating mind had grasped the reasons for the failure of successive attacks by the Entente armies, as well as the real meaning and significance of Cambrai. Profiting by the experience of others—always a most difficult thing to do, but perhaps particularly so in war—he had refrained from himself taking the initiative until the Russian *débâcle* had put him in a position to do so on a really grand scale. By March 1918 he was able to mass some 80 well-trained divisions for offensive operations in the West, and this in turn enabled him to attack the British III. and V. Armies on a front of 80 kilometres.

---

[1] In addition the British armies in particular had to overcome almost incredible difficulties in keeping up the requisite supplies of ammunition and food over a country which was almost devoid of roads. It was indeed found necessary to institute a regular road department of the transportation directorate.

[2] It should also be noted that the perfection (coupled with ample supply) of instantaneous fuze now made the destruction of wire defences a far simpler affair than it had been before.

[3] It should be noted that the earliest embryo of the tanks made its appearance against Bullecourt in May 1917; but the number of these new engines was then insufficient and their tactics were not well understood. The attack failed, but the date is important historically.

The mere fact of being able to stage an attack on this scale gave the German armies a great prospect of success, and eliminated the third of the causes of failure enumerated above. The other two were more difficult to deal with, but in order to secure surprise Hindenburg and Ludendorff decided to dispense with that counter-battery work and artillery preparation which on the Somme, at Arras and round Ypres, no less than in Champagne, had disclosed the Allies' intentions while at the same time rendering the ground difficult, and sometimes impossible, to the attacking infantry. Five hours only were allotted to the artillery bombardment, and in this time wire was to be cut and the enemy guns to be mastered at least sufficiently to allow the infantry to advance. Such was the solution of the second problem—the introduction of surprise—and the decision to attempt so much in so short a time was perhaps the bolder since the German army must accomplish without tanks and on a much larger scale what the British had accomplished with them at their last attempt.[1] The third difficulty—that of coöperation—was overcome by the provision of large numbers of light trench mortars,[2] which, as well as a proportion of field guns, accompanied the infantry advance, as well as by an elaborate system of light signals by which the infantry might indicate their position and wishes to the artillery.

Thus each of the difficulties of 1915 found an appropriate solution in 1918. The attack was on a sufficiently large scale to allow considerable room for manœuvre within the salient which was inevitably formed; the infantry received adequate support from the artillery, at least for several days, and until it was itself exhausted by appalling loss and by the breakdown of supplies (for which the efficiency of the British air service was largely responsible) on congested roads; lastly, a tactical surprise had been effected, with the result that the troops which bore the brunt of the first onslaught were without reinforcements for several days, and this was principally due to the fact that there was no preliminary bombardment to indicate definitely the portion of the front which had been selected for attack.

Nevertheless, notwithstanding the admitted skill and care with which the German commanders had prepared their plans and the colossal scale upon which they carried them out, they, no less than the Entente, failed to reach decisive results. What they did was to show what it was possible to achieve with the materials which science and industry had by this time placed in the hands of the commanders in the field. They had shattered many of the shibboleths of trench warfare and shown that infantry was still the conquering arm. In doing so, they not only exhausted their own man-power, but set loose a new set of tactical ideas which were seized by the genius of Marshal Foch and eventually assisted in their own destruction; for, just as Germany had learnt from the Allied successes and failures of 1915, 1916 and 1917, so the Allies in their turn learned from the German success and failure of 1918.

Foch in Command.—It is not necessary here to trace the steps which led to the appointment of Marshal Foch to the Supreme Command in March 1918. All that remains to be done is to follow the effect of that appointment upon the tactical history of the war on the western front. Even after the first great German drive had been checked in front of Amiens, the initiative remained with the Germans for more than three months while the great soldier who was now in command of the Allied armies was reorganizing his forces and making his own plans. During this period the German attack tactics were unaltered, but each successive effort was a little weaker than that which preceded it, and the only new development was the skill with which one French commander evaded the enemy's blow, surrendered his forward posts and crushed the assaulting lines as they approached his real fighting positions. Such tactics were only possible at a specially favoured portion of the front, but that they were brought into play at the right place and at the right time was another sign that trench warfare was becoming a thing of the past. Meanwhile Foch was maturing his plans, and when historians of the future, with full documentary evidence at their disposal, examine the record of these days it may be found that the marshal's greatest claim to fame is that he, the student of the past, still retained his belief in the war of movement and in the counter-stroke as the strongest weapon of defence.

Twice in the earlier stages of the war great counter-strokes had been delivered with marked success, but for two years they had not been repeated, and the side which had attacked had been met only with passive defence. In 1914 the German sweep towards Paris had been outflanked by Manoury and thrust back to the line of the Aisne, and nearly two years later the costly attempt to capture Verdun had been checkmated by the opening of the first battle of the Somme, though not until it had been in progress for several months. Since that date there had been the two great Entente attacks of April and July 1917 and the German attack of March 1918. In 1918 troops for the attack were provided by withdrawal from Russia, where they were no longer required; but in 1917 it had been necessary to denude important parts of the front in order to release the number of divisions necessary for offensive action, and to trust for defence to a highly developed trench system which could be held by comparatively few troops, so that there was a considerable risk of counter-attack. It is remarkable that, against an enemy trained in the German traditions, the assailant was always able to impose his will, and the defence became largely a question of railways and transportation. The relief of troops on a fighting front, their replacement by others, and their transport to a quiet part of the line became a regular tactical system to which the French gave the name of *roulement*. It was a new feature of war, completely contrary to the peace teaching of every country, but one which was the logical result of the elaborate preparations which were then considered necessary before it was possible to burst through a modern system of field fortification. It was not until Marshal Foch assumed command that the grand tactics of defence underwent any real change, and perhaps he was fortunate in that Cambrai and the March offensive had shown what was possible, and that, as the result of the movement which had taken place, the positions held by the opposing forces were not so formidable as they had hitherto been. Be that as it may, it is none the less the fact that Marshal Foch had the courage and resolution to make his defence active, and to base it upon the counter-attack—to return, that is, to the practice of former wars, and to the theories which he had himself so often preached in peace.

---

[1] The facts that the German design had been foreseen at Versailles and that the evidence of prisoners confirmed the British forecast in no way detract from the tactical skill with which Ludendorff's plans were prepared and executed, or from the value of the lesson.

[2] It has been said that the Germans possessed 15,000 of these weapons in 1918.

In this connexion two points of particular interest should be noted. First, it was not until the middle of July in 1918 that Foch was ready to pass from the defensive to the offensive, and by that time the Germans were perilously near Paris. There must, therefore, have been a grievous temptation to stand purely on the defensive, as Ludendorff had so often done with success, and it was a bold decision which rejected what to a lesser man might have appeared the easier and the safer course. Secondly, there was the peculiar configuration of the German front, which, after running almost due south from the English Channel to Soissons and Château-Thierry, turned sharply eastward to Verdun. The German forces within this right-angled salient were lapped round and enveloped, with the result that in whatever direction they attacked they must expose a flank to an active and vigorous opponent. If Ludendorff should attack southward, Foch would counter eastward from the west face of the salient; similarly, if Ludendorff attacked westward, the counter-movement would come from the south. In either case vital German communications provided a strategical objective within possible striking distance. It was indeed a weak tactical situation, in which a series of great and costly but only half-successful assaults had landed the German army, and of which the commander of the Entente armies intended to take full advantage.

His opportunity came in the middle of July. On the morning of the 15th the Germans attacked on both sides of Reims. For three days the battle continued with varying fortunes, until at daylight on the 18th Foch launched his carefully prepared counter-stroke on a front of 35 miles against the right flank of von Boehm's army. There was no artillery preparation, but the French advance was covered, on the Cambrai principle, by a swarm of tanks. The surprise was complete, and by nightfall the German flank was crushed and von Boehm's principal line of communication was in Mangin's hands. But more than this had happened, for at one blow Foch had passed from the defensive to the offensive, and had seized the initiative, on a more comprehensive scale, but in the form made classic by the great commanders of history. The initiative, once chosen, was never relinquished, but was followed by a series of rapid and vigorous blows, beginning with the brilliant attack by the British IV. Army south of the Somme on Aug. 8. From that moment until 11 A.M. on Nov. 11 the German army knew no rest, but was pushed from one strong position to another by victorious forces of many nationalities, into all of which Foch had been able to instil something of his own personality and surprising vigour. The time as well as the direction of the counter-stroke had been truly chosen, for, after acting on the offensive through four strenuous months, the German infantry had exhausted its strength, and moral defection and despondency had spread from the homeland to the armies in the field. It is Foch's eternal glory that he had had the moral daring to wait until this moment had come. So the great counter-stroke of 1918 had in it all the elements which had gone to make the success of exactly similar, if smaller, efforts in former campaigns. It was carefully prepared as an integral part of a general plan of campaign; it was directed against an adequate strategic objective; it came as a surprise; and it was correctly timed. Perfect in conception and execution, it met with its reward, but the curious thing is that it contained nothing new. What the world really saw on that July morning of 1918 was the touch of the artist who knew how to express old ideas in modern terms of war—for Foch was bigger than the tools he handled. Perhaps Ludendorff was not—but it is easy to criticize the commander who fails.

Attack Tactics.—At this point it may be as well to leave the subject of the counter-attack and to return to the study of infantry and artillery coöperation as exemplified in the latest phase of the operations. Once more we may turn with advantage to a French memorandum on attack tactics. This time it is one dated July 12 1918, only six days before Mangin's counter-attack. In it, as in all the more recent documents, stress was laid upon surprise, and it was expressly laid down that attacks must be launched either without artillery preparation, or, if that was not possible, then the bombardment must be as short and as violent as possible. Then followed the important words:—

> "Finally, the infantry must realize that it possesses an armament which is strong enough to enable it to exploit its first success, and to continue its progress, while overcoming local resistance with its own resources and without artillery action."

The same spirit inspires the IV. Army instructions for Aug. 8 when the tactics of Cambrai were more or less closely followed. What a change from the memorandum of June 1916 when the system of methodical advance from position to position, with artillery preparation preceding each stage of the infantry movement, is insisted upon. Surely tactical opinion has again come round full circle, and at the end of four years' war we are not very far from the position at which we started: "Artillery does not prepare the infantry attack, but supports it." Yet both the tactical memoranda from which we have quoted have the same high authority, that of Marshal Foch himself, and both are wise, for the conditions of 1918 differed widely from those of two years earlier. In 1916 the initial attack was against positions upon which months of labour had been spent, and held by an infantry confident in their leaders and in themselves, and quite sure of ultimate victory. Against such defences and with the material at the disposal of the Allied commanders, prolonged bombardment offered the only possible prospect of success; but it equally increased the difficulty of subsequent movement across heavily shelled country and left the enemy in no uncertainty as to ultimate intentions. In minor operations, notably round Thiépval and Beaumont Hamel, real tactical surprise was frequently attempted with success, but only in comparatively minor operations undertaken with important but limited objectives when the defence had been already disorganized.

In 1918, on the other hand, German infantry had been wearied by incessant travelling from front to front in its efforts to burst through the network of opposing armies, with which Entente strategy had encircled it. Two years of effort, which history will certainly look upon as prodigious, had culminated in the great offensive which, begun on March 21 and ended on July 18, had exhausted the physical energy of the troops and produced a corresponding deterioration of *moral*. At the same time two years of under-nourishment and nervous strain had undermined the spirit of the civil population to an extent which was necessarily reflected in the army. The defences, again, were but improvised trench systems, hastily adapted to the requirements of the moment and in no way comparable to those of 1916. Against them the British and French armies could bring a more numerous and more powerful artillery than at any previous period of the war; a better and more numerous air service; a more formidable infantry equipment, thanks to the now universal light mortars; and, finally, an ample provision of tanks—those new engines of war which were certainly the best means of overcoming the German machine-gun defence and, by their moral as well as their physical effect, were to play so great a part in the final phase of the war. With such changed conditions it would indeed have been strange and wrong if corresponding changes had not been introduced into tactics. Changes in tactics are brought about by scientific discovery and consequent improvements in the means of killing. At no time in history have men of science devoted themselves so universally and so whole-heartedly to war requirements—that is to say, to the art of killing their fellow-creatures—as they did from 1914 to 1918. Gas, bombs, smoke screens, wireless telegraphy in the field, are but a few of the means by which scientists had a direct influence upon tactics and by which the research student in the laboratory was directly connected with the platoon commander in the field.

It was, therefore, by the united efforts of all classes in a truly national war that trench warfare came to an end in Aug.

1918; but that which followed was not the open warfare of Frederick the Great, Napoleon or Wellington. Even to the very end, in Nov., the opposing lines were continuous for 300 miles, and no open flank afforded opportunity for crushing defeat. Local flank attacks there were in plenty, and some on quite a big scale, but there was no Waterloo or Sedan. It had been a national war, and the German nation had suffered a crushing national defeat; but even when the Emperor had deserted and fled ignominiously to Holland the beaten army was still able to withdraw across the Rhine in some semblance of order.

Palestine.—Different in almost every respect, and therefore also in the tactics employed, were the campaigns conducted in parts of the world outside Europe. This was especially so in Palestine, and for that reason will it be well to devote some space to the special conditions of that theatre of war and upon the resulting conduct of operations. In the first place the theatre of war was practically a neutral country. Nominally a part of the Turkish Empire, Palestine was in actual fact extra-national, or extra-imperial, with a population by no means united or enthusiastic in support of the Turkish power. The Russo-Japanese War offers another, and even more remarkable, instance of a quarrel between two nations being settled on the territory of a third. In such conditions the war can have none of those national characteristics which formed such a dominating and distinctive feature of the war in the west of Europe. This was the fundamental difference between the main campaign and the subsidiaries, from which it came about that the defeat of Turkey was less national and far more military than was the defeat of Germany. A second important feature of difference is to be seen in the railway development of the theatre of war. It is only through a complete network of railways, supplemented by road transport, that a nation is able to concentrate the whole efforts not only of its manhood, but of its entire population upon the one purpose of winning a war, just as in peace the whole efforts of a population are concentrated upon various forms of industry. When the necessary conditions are lacking, the resultant warfare must inevitably be, if not exactly more primitive in form than in a highly developed country, at least nearer to that waged by the professional armies of the past.

The preparatory stages of this campaign, including the Turkish raids against the Suez Canal and the subsequent advance to El Arish and the neighbourhood of Gaza, need not detain us beyond noting the construction of the broad-gauge railway from Kantara across the Sinai desert. It was wise strategical and tactical foresight which had led Allenby's predecessor, Sir A. Murray, to insist upon a broad-gauge line and so be prepared for operations on a large scale instead of yielding to the temptation to content himself with a narrow-gauge line, which could have been more easily and rapidly constructed and would have sufficed for his own immediate requirements. A false, or at least a different, decision on his part in the spring of 1916 would have had a most hampering effect upon subsequent operations, of which it was at that time only possible to foresee the most shadowy possibility.

For the purely tactical study, we may pass at once to the period of Lord Allenby's command and the advance in Palestine. This period may itself be divided into two phases: first, that campaign which began with the capture of Beersheba on Aug. 31 1917 and culminated in the entry into Jerusalem on Dec. 11 of the same year; secondly, the dramatic series of operations which, between Sept. 19 and Oct. 26 1918, resulted in the destruction of the IV., VII. and VIII. Turkish Armies.

Allenby's strength in mounted men was significant of the possibilities of the theatre in which he was to operate. In discussing the development of the tactics on the western front no mention has been made of the mounted arm, simply because after the first weeks of the war it had no scope for acting in its peculiar sphere; there was no scope for mobility and the mounted man never really found his opportunity. It was exactly the reverse with the Palestine campaign. So we find that in all these operations the infantry gets from the cavalry or other mounted troops far more of the support which it always requires and from the artillery far less. There are no long preliminary bombardments, for as a rule there are neither guns nor targets, but in the very first operation undertaken, the capture of Beersheba, "a mounted attack by Australian Light Horse, who rode straight at the town from the east, proved completely successful. They galloped over two deep trenches held by the enemy just outside the town, and entered the town about 7 P.M., capturing numerous prisoners."[1] In passing, it is worth noting that the operation against Beersheba was undertaken expressly because "when it was in our hands we should have an open flank against which to operate, and I could make full use of our superiority in mounted troops"; and again, when the city had been taken, with 2,000 prisoners and thirteen guns: "This success laid open the left flank of the main Turkish position for a decisive blow." Surprise and movement had taken the place of costly infantry assaults, simply because local conditions had made them possible.

Exactly the same experience was repeated in the second stage of this campaign, which began in Sept. 1918 and ended when the armistice came into force on Oct. 31. At the commencement of these operations the Egyptian Expeditionary Force was holding a line from the river Jordan on the right to a point where the left rested on the Mediterranean coast, 10 miles north of Jaffa. The total fighting strength of the force was 12,000 mounted men, 57,000 infantry and 540 guns. Opposing them, the Turkish IV. Army watched Lord Allenby's right on the Jordan, in the centre was the VII. Army on a front of some 20 miles, while on the right was the VIII. Army holding a similar length of front. Including reserves, but excluding certain posts on the Hejaz railway which were more than fully occupied defending themselves against the Arabs, the Turkish commander-in-chief had at his disposal some 4,000 mounted men, 26,000 infantry, with 400 guns, by no means a strong force with which to stand on the defensive on a front of over 50 miles against an active and resolute enemy.

Allenby's numerical superiority, it will be noted, was especially in mounted men, and this he decided to turn to full advantage when he resolved to make Nazareth, a good 40 miles to the north, the objective of his next advance; but to set his cavalry free it was first necessary for the infantry and artillery to force an opening through the Turkish front. By using every device to deceive the enemy as to his intentions, Allenby was able to concentrate 35,000 rifles and 383 guns on his left, where they were opposed by no more than 8,000 rifles and 130 guns, while two cavalry divisions and one Australian mounted division were immediately available.[2] The infantry attack was launched at 4:45 A.M. on Sept. 19 after an artillery bombardment lasting no more than fifteen minutes, the exact object of which is not clearly evident. The attack was completely successful, and the cavalry, dashing through the opening afforded to them, seized the communications and closed all lines of retreat to the north. Nazareth was entered on the second day of the operations, and four days later "the last remnant of the Turkish VII. and VIII. Armies had been collected." The IV. Army met the same fate only a few days later, and on Oct. 1 the Arab army and Allenby's Mounted Corps entered Damascus, which lies nearly 100 miles in a straight line to the north-east of Nazareth. Still pressing northward, and completing as they went the unutterable destruction of the Turkish armies, the mounted troops, with a few armoured cars, entered Aleppo, more than 200 miles north of Damascus, on Oct. 26, and when the armistice was signed on the 31st were within striking distance of Alexandretta.

II.—TACTICS AFTER THE WORLD WAR

An effort has been made so far to give in outline some idea of the tactical conditions on the western front and in Palestine, the methods resulting from these conditions, and the results achieved. Utterly dissimilar as were these two theatres of war, the underlying principles of victory are found, as always, to be the same. A firm faith in the offensive, concentration at the right time and against a suitable objective, surprise, and coöperation. The welding of all the forces, moral and physical, by the genius of the commander into one homogeneous whole, with one common inspiration, and directed to a common objective, namely victory. So far the two campaigns selected for illustration are in agreement with one another and with all the campaigns of the past; in every other respect the contrast is complete. On the one hand, in France and Flanders we find whole nations in arms, troops numbered by hundreds of thousands, and, as a necessary corollary, continuous lines, heavily fortified and without flanks to be turned, almost (one might say) without any vital line of communications, so complete were the railway and road systems available. As the result—long periods of stagnation, infantry deriving no assistance from the mounted troops (except indeed when acting dismounted), and dependent in the first place upon artillery and latterly upon tanks as well. Movement, when at last it comes, is by slow stages, until when victory is won it is by the crushing of a nation rather than of the armies in the field alone; for this was national war. On the other hand, in Palestine we find armies operating in a neutral arena, small in numbers with open flanks to the east, and each dependent upon a single line of railway; scope and objective not only for trained and disciplined mounted troops, making full use of their mobility, but also for light rapid-moving Arab levies harrying the Turkish communications, and achieving great strategical and tactical results, with but little loss to themselves, entirely by the power of movement. Artillery here plays but a secondary or even lesser rôle, for instead of congestion there is space—space in plenty, and when that element is present light troops come into their own; activity takes the place of force, and victory is over the field armies rather than over the civil population.

---

[1] From Lord Allenby's despatch, dated 16.12.1917:—"What would not the British or French cavalry on the western front have given for such an opportunity! But wire, mud, shell holes, and especially German machine guns, effectually prevented any such possibility."

[2] Lord Allenby's despatch, dated 31.10.18.

Between the two extremes of the western European front and Palestine lay such other campaigns as Mesopotamia and Macedonia; but these, though interesting enough in themselves, add nothing to our present purpose and seem only to emphasize the same theory in less convincing form—namely that each theatre of war, by its own distinctive physical features and climate, influences, if it does not actually dictate, the tactics by which battles and campaigns are won. Otherwise war might become an exact science instead of the most difficult of the arts.

This war of 1914–8, then, by its very size and variety, has solved no tactical problem, has answered none of the questions left by S. Africa in 1899–1902, or Manchuria in 1904–5, but, like all its predecessors, has raised many new ones. Strategy is still the art of bringing the enemy to battle on terms which are disadvantageous to him; tactics are still the methods employed for his destruction. In former wars this most desirable object was accomplished by a judicious combination of artillery, cavalry and infantry. To-day the object is the same, but the means have been complicated to a degree which in 1910 was altogether beyond human imagination. Railways have completed the work of Carnot and the French revolutionary generals, and made national war a complete reality; but through the perfections of the internal-combustion engine war itself has taken on a third dimension. If a great master was formerly required properly to handle and combine the comparatively primitive means at his disposal, how much greater should the artist now be who is to use, and not to waste, the much more complicated tools which science has now placed in his hands. As science advances the art becomes more complex, things tend to become greater than men, and use more difficult than invention. Always change has followed along the same line, but so rapid have been the latest steps that the armies of 1921 were further from those of 1821 than Napoleon's armies were from those of Hannibal; yet the human imagination and capacity remain as they were two thousand years ago.

All through the ages changes in tactics have been brought about by improvements in the means of killing. Latterly science has advanced with giant strides, yet the mechanism of slaughter appears to be only in its infancy. How difficult, therefore, to foresee even with what weapons later wars may be fought, and what may be the next steps in tactical evolution. It is easy, indeed, to let the imagination run riot, and to picture whole populations destroyed by infernal machines easily and efficiently controlled by wireless waves. The pebble is to be thrown in at Berlin, Stockholm, Moscow or anywhere else you will, and the influence carried to the uttermost parts of the earth. Equally easy it is to persuade oneself that there will be no change, and the next war will begin exactly where the last left off. History teaches us, unfortunately, that neither of these views is likely to be exactly fulfilled. Possibly they serve as useful correctives one to the other; but the difficulty is to strike the happy medium. When so many new questions have been raised and so few old ones have been answered, only one definite new principle seems to have been established. It is that, more than ever before, tactical methods must vary in accordance with the theatre of operations, and that methods suitable to one country are unsuitable to another. Indeed even this is hardly new, since it is clear that methods which sufficed to overthrow the Mahdi at Omdurman would have been quite unsuitable against the Boers in S. Africa. A short time ago we were satisfied with two classes—"normal warfare" and "savage warfare"; that is to say, war against highly trained, well-equipped professional armies or against primitive races, of which every able-bodied man was an ill-equipped untrained soldier. Those distinctions no longer suffice. Here there is an initial difficulty, for in trying to imagine the tactics of the future we must first imagine the conditions under which war will be fought. Will they resemble the conditions of France and Flanders, of Macedonia, Mesopotamia or Palestine?

Conditions for Future Wars.—One thing is certain, that the wit of man cannot devise a system which will be equally suitable for all. Principles there are, but nothing more. This is especially a British difficulty, for no army of the world is called upon to fight under such varying conditions as is the British; moreover, the British army of modern history has never fought in its own country. It is only necessary to reflect upon the history of the World War of 1914–8 to realize that, while Germans fought almost entirely on their own frontiers, if not in Germany, Frenchmen in France, Italians in Italy, Turks and Bulgarians in Turkey and Bulgaria, the British army and troops from the British Dominions and India fought all over the world. French troops, it is true, fought in many distant campaigns, but except at Salonika the oversea campaigns were preponderatingly British, and cannot be considered apart from the British Dominions and India. The only other countries at all in like position are America and Japan, with few extra-territorial commitments.

As a further branch of this same problem we must for a moment consider the troubles of organization and equipment which are inseparable from those of tactics. The French army exists for the defence of France, the Italian army for the defence of Italy. Defence, no doubt, includes offensive action, especially in the case of Germany, but how simple these tasks seem compared with that imposed upon Great Britain with all her world-wide interests. It is easy to see with what confidence the general staffs of continental European nations can address themselves to their well-defined problems, and how much more complex are the manifold problems of the British general staff. Others can fortify their frontiers. Not so Great Britain or her Dominions, who must always be prepared to fight oversea in some theatre of war which cannot be foreseen with any degree of confidence or certainty. That is one fundamental and special complication, as the result of which tactics, organization and even equipment must always, from a British point of view, be something of a compromise, ready and able to be adapted to special conditions on the actual outbreak of war.

Let us consider for a moment what is to be the future of trench warfare. Will future wars reproduce the conditions of 1914 which led up to it? Will it be the normal warfare of the future, or was it no more than a passing phenomenon? Is it desirable or not to organize, train and equip modern armies with a view to it?

The only possible answer to these questions is that nobody knows. Similar conditions would no doubt produce similar results, but are we likely to find them? What we know beyond the possibility of doubt is that in 1914–8 highly developed industrial countries with dense populations were fighting on or near their own borders. It was these conditions which made possible a war on a front of hundreds of miles; and we may well ask if they can be found again, and, if so, where? Probably the answer would be that only nations possessing the greatest possible resources could support a war of this kind, and that those nations are extremely limited in number, even more limited in 1921 than they were in 1914. Trench warfare in its extreme form is the direct outcome of the industrial revolution of the nineteenth century, and is not possible between such nations, for instance, as Russia and Poland.

But there is more than this. It must also be remembered that trench warfare came in 1914–5 as a surprise, and that all armies dropped into it quite unconsciously. It began with a few strands of ordinary wire laid out in front of simple old-fashioned fire trenches. It was indeed a strange phenomenon. In place of the rapid decision for which everyone had looked, the largest armies the world had ever seen were peering at one another through their screens of metal. That was late in 1914, just at the moment when all the belligerents had practically run out of gun ammunition, when there was no means of dealing with such an unexpected obstacle, and neither side could get at the other. Nothing like this had ever been seen in war. As we now know, it took four years to find the way out of the impasse, but the important point to note is that after the war every nation possessed the antidote. With masses of artillery, instantaneous fuzes and tanks, is trench warfare of this type in any circumstances conceivable? One thing at least seems to be certain, and that is that, having learnt their lesson, the armies of all nations will strain every nerve to render it impossible, and to avoid a repetition of the wearisome experience of 1914–8.

If this means anything at all it is that future wars between civilized nations will be opened with a suddenness and violence far in advance of 1914. In past wars there have always been a few days of grace between the declaration of war and the first serious collisions. In 1914 Germany issued orders for her general mobilization on Aug. 1, France declared war on the 3rd, the Belgian frontier was crossed by Germans on the 4th and by France on the 6th; Liége was entered on the 7th, and the last forts were captured on the 15th; finally the field armies came into collision on the 17th and 18th. Meanwhile on the southern front the French occupied Mülhausen on the 8th with covering troops, but failed to hold it, and it was not until the 14th that their I. and II. Armies and the Alsace group were mobilized and ready to advance into Alsace and Lorraine.

Now, in considering the strategy or the tactics of the opening phases of any future campaign, it was very difficult in 1921 to divest the mind of the picture of 1914, and to remember that there no longer existed in Europe two great military nations with armies magnificently led, fully organized and separated only by an almost imaginary line called a frontier. Something of the sort, it is true, may be found in the borders of France and Italy, but a formidable mountain range only to be traversed by troops at certain well-defined points introduces an important factor which was absent in 1914. Other open frontiers also remained in 1921, notably between Germany and Poland, between Poland and Russia, and still between France and Germany; but, for the time at all events, organized well-equipped armies no longer existed as we knew them in 1914, except in the cases of France and Italy. Nevertheless it is necessary to look forward. Germany, no doubt, had been forbidden by the Peace Treaty to maintain an army of more than 100,000 men, but it was by no means impossible that before many years had passed several of the more backward nations of Europe would become rich and prosperous, with great industries and extensive railway systems, and would be unable to deny themselves the luxury of great standing armies and all the paraphernalia of war. History, at least, is not encouraging in this respect, and it would certainly be most unwise to assume that, because the necessary conditions of a first-class war were no longer visible in Europe in 1921, they would remain so for ever, or even for a very long time; moreover, it cannot be forgotten that the opening years of the twentieth century saw a first-class war far outside the confines of the European continent.

No excuse is, therefore, necessary for the assumption, in 1921, that coming generations would know war even as the present generation has known it, and that its opening phases would not be so very unlike those of 1914, always with such difference as is brought about by the scientific development of engines of destruction. If this assumption is justified—and it is absolutely necessary to make some assumptions—the prospect is that either there will be no declarations of war, or that by various means the period of mobilization will be very much shortened and the great collisions will take place much more rapidly than before. And this with two objects, partly to avoid trench warfare and to reach a rapid decision, partly to ensure that fighting shall take place on enemy territory and not in the homeland. These objects are in their essence strategical, but will naturally find themselves reflected in the tactical sphere. In the first place, with a view to protecting themselves from a sudden inrush, nations may have to spend vast sums upon the fortification of their frontiers, as France did after 1870, and as Germany did for ten years prior to 1914. The influence of these great fortifications and their ultimate fate are not, however, very encouraging, and it is more probable that money may be spent upon the equipment of field armies, and that very special attention may be paid to the success of the first inroad into enemy territory, to seizing the initiative, upsetting the enemy's plans and insuring that at least the opening battles are fought upon his soil.

Tanks and Aeroplanes.—For these purposes great use will presumably be made of aeroplanes, and rapid-moving tanks acting in company with cavalry and horse artillery, and here we are at once upon highly speculative ground—since the tactical value of these new services is still uncertain. There is a fascination in dreaming of possibilities, but experience shows that tactical development has always proceeded by the slow processes of evolution rather than by revolution, and notwithstanding the great successes achieved by tanks towards the end of the World War, it is difficult to believe that they will be able to act alone for any great length of time. In this connexion it must always be remembered that at the end of 1918 tanks had the enormous advantage of still being something of a surprise. They were constantly improving in efficiency and numbers, and through bitter experience correct tactical methods were gradually evolved. More important than all, even up to the end of the war anti-tank defence was ineffective, an advantage which the new arm cannot expect to enjoy even at the beginning of future campaigns. Even with this great advantage in their favour tanks were vulnerable, and at Hooge and even at Cambrai it was seen that boldly handled artillery could, on occasion, inflict great damage. Increased speed and improved mechanism will render tanks less vulnerable, but against them must be set such possible defence as light easily hidden artillery and anti-tank guns. Indeed, there is just a possibility that future years may see a competition, not unlike that at sea, between gunnery in its various branches on the one hand and speed coupled with armour on the other. The tank will endeavour to combine mobility for offensive action with its own protection, while the gunner and rifleman will try to force the tank to carry armour so heavy as to destroy its mobility. Something of this kind was actually seen in the case of the German tanks, which, in the effort to afford security to their crews, had been so solidly constructed as to be almost useless. Another difficulty from which tanks may suffer is inability to carry out their own reconnaissance in moving warfare. Tanks would also appear to be almost as defenceless at night as is artillery; they are indeed entirely an offensive weapon except for the actual protection which their armour affords to the crews. For these reasons tanks would appear to be dependent upon other arms, and incapable of entirely independent action at all stages—for reconnaissance, for overcoming anti-tank defence and for security. At the same time there is no doubt whatever about the immense reinforcement of offensive power which they have brought to the other arms. In themselves they combine mobility, fire and protection, each in a certain degree; moreover, they may solve many difficulties with regard to supply of ammunition, especially to cavalry. It has been amply proved that the great enemy to cavalry, and to infantry as well, is the machine-gun, and it is exactly against this weapon that tanks have proved themselves to be most efficient. Once a machine-gun is located in the open, *i.e.* almost anywhere except behind concrete defence, the tank can deal with it quickly and effectively, while guns heavy enough to destroy the tanks themselves should in their turn be dealt with by horse artillery. In this way each of the three arms will derive support and protection from the other, and all will derive information and active assistance from the air.

Aeroplanes will carry out both strategical and tactical reconnaissance, will locate the enemy's forces, and, so long as light lasts (an important reservation), will watch and report his movements. In action they will watch the progress of their own forces, look out for counter-movements, indicate in every possible way the nature of the enemy defences, and intervene in the fight, whenever possible, with bombs and rifle-fire. If any such coöperation is to be possible, the various arms must not only understand one another thoroughly, have been trained together and have established a mutual confidence, but they must have ample and efficient means of intercommunication, which can only be by wireless telegraphy or telephony.

The same principles must apply to the employment of tanks with infantry and field (including heavy) artillery. Of all the difficulties which infantry has to overcome the two most dreaded are wire and machine-guns. In discussing the action of tanks with cavalry, rapid movement over comparatively open country has been assumed, but it is unlikely that this can be more than a preliminary phase of a few days' duration in a campaign where the belligerents are on even terms in matters of equipment. Heavy slow-moving troops will be rushed by rail to the frontier and will come into action within a few miles of railhead. Then will come the great struggle for the initiative, the result of which may well decide the whole war, and ruthless vigour will be demanded from troops and leaders. At this stage there will be great battles in which, as in August 1914, neither side will be completely on the defensive or completely on the offensive; but both, in their determination to reach rapid decision, will think chiefly of attack, and there will be comparatively few highly organized defences, other than those which may have been prepared in peace-time. Hastily prepared defences may be extremely effective against infantry, especially if well concealed. It is then that tanks, moving easily across country, crashing through hedges, crossing hollow roads, climbing embankments and making paths, easily and quickly, through hastily constructed wire entanglements, will be of the utmost assistance to their accompanying infantry. In the stage of the campaign we have tried to imagine there will hardly have been time to construct land mines, the tank's greatest enemy, but the opposing infantry will be provided with heavier anti-tank rifles and more light field guns than are possible with cavalry. Possibly the tanks themselves may be more heavily armoured than those with the cavalry, where rapid movement is the ruling factor, but they cannot be entirely proof. They, like the cavalry tanks, will be dependent upon the air for information and upon artillery for support. Hence smoke screens, concealing the moving target from the defending guns, may be invaluable, as well as the moving barrage and the fire of guns told off to deal with special obstructions, batteries of emplacements which have been reported by aeroplanes or detected from air photographs. But since both sides will possess tanks, presumably approximately equal in numbers and efficiency, and since the tank is essentially an offensive weapon, it is probable that a new feature may be introduced into tactics, namely tank counter-strokes and tank engagements, for on each side these machines will attempt to get at the enemy's infantry and protect its own. But with all their power for offensive action the tank still has grave limitations, for there are still obstacles to movement, such as the muddy banks of a sluggish stream, which they cannot overcome; mud, as the armies knew it in Flanders, is to the tank what uncut wire is to the infantry, and without power to move the tank is highly vulnerable. Valuable as they doubtless are, it is, therefore, easy to fall into the error of overestimating their possibilities, and it is important to bear in mind that they will not always have the moral effect upon infantry that they had when they were terrible and unfamiliar objects on the battlefield. They cannot turn hostile infantry out of even hastily prepared entrenchments; the most they can do is to make it comparatively easy for their own infantry to get in, and even to do so much they are themselves dependent upon the help of supporting artillery, while all arms are almost blind without the help of aeroplanes.

So far it may perhaps be possible to penetrate into the future, and to anticipate that the opening stages of the next great war between highly developed nations possessing contiguous frontiers will not be very unlike those of 1914 except that they will be fought out with more complicated machinery and with even greater vigour. He would, however, have to be very bold who would venture to prophesy whether, with all the new inventions we now possess, or indeed with others of which we as yet know nothing, wars will really be short and decisions quick or whether prolonged passive resistance is still a possibility. Have the aeroplane and the tank, heavy artillery and the instantaneous fuze so strengthened the offence that it will be able to overcome any defence which human ingenuity can devise, and that there will be a return to the Napoleonic era, or will the defence again be able to assert its superiority as it did from the winter of 1914 to the summer of 1918? Is it again possible that aeroplanes, aided conceivably by artillery firing at extreme range, may wage war against the civil population with asphyxiating gases and heavy bombs, and render war so terrible and so destructive to life and property that field armies may cease to have their purpose? The answer would appear to be that one lesson which emerges from the late war is that there is no limit either to human ingenuity or to human endurance, and for that reason, if for no other, it is only prudent to assume that the balance between offence and defence will be as finely adjusted as ever in the past, and results will depend not upon engines but upon the brains and courage of those who use them.

Minor Wars.—If we leave for a time the consideration of what may be termed first-class campaigns and turn to those of the second or third class, it would certainly seem as though science had rendered the advantage of civilized nations over uncivilized greater than ever before in both the strategical and tactical spheres. As has been shown, one great feature of differentiating first- from second-class campaigns is that of space and freedom of movement. Movement means power to concentrate with rapidity and secrecy and so to effect surprise. Now, it so happens that while campaigns of the first class have in the past been confined almost entirely to Europe, those against uncivilized or undeveloped races are conducted under the burning skies of Africa or Asia. Frequently the climate has been a more formidable foe than the enemy, and the tribesmen or local levies have had far greater mobility than highly trained European infantry. Any device, therefore, which can add to mobility is enormously in favour of the civilized man, the product of industrial conditions. The campaign in Palestine gives the best possible example of tactical success directed against a suitable strategical objective. Victory when it came was absolute and complete, but it was over an enemy whose *moral* had been shaken through acting purely, or almost purely, on the defensive through four years of war. Against that enemy the British forces had won a series of tactical successes, but it was not until cavalry had secured full liberty of movement that tactical success was crowned by strategical victory. Against an enemy ill provided with special means of defence and with inferior artillery equipment, fast-moving tanks should give to cavalry or mounted infantry an invaluable reinforcement in fire power. It is the weakness of mounted troops that whenever they are called upon to use fire one-fourth of the personnel is out of action, merely taking care of their horses; and this at the critical moment of action. No such disability handicaps the tanks, whose fire power is great in proportion to the personnel employed. They will, therefore, supply exactly the factor in which mounted troops are necessarily weak, while their own peculiar drawback, vulnerability to fire from artillery or specially constructed rifles, will be of little account. Mechanical difficulties, from heat and other causes (for the strain upon the crew in a closely confined space is always great), they will certainly have, but these should not be insuperable and may be disregarded. A mixed force of tanks and mounted troops should therefore have just that combination of mobility and fire power which is necessary to allow civilized troops to make free use of space—that is, to manœuvre freely and confidently—against an uncivilized or ill-equipped enemy before his *moral* has been shaken.

Exactly the same arguments apply to tanks acting with infantry and artillery in a formal attack against an uncivilized enemy in position. The mere fact that such an enemy does not himself possess tanks will add enormously to the moral effect of their appearance, and should go far toward rendering an artillery preparation or bombardment of any kind unnecessary. If this is so, surprise becomes much more simple; and surprise is, as always, the strongest weapon of the attack. It is evident, therefore, that at every stage the older arms will be wonderfully strengthened by new inventions, yet it cannot be claimed that even in second- or third-class warfare science has yet succeeded in producing anything entirely to take the place of the man and the horse; for the man and the horse are, after all, the only pieces of mechanism which are adaptable to varying circumstances, yet perfect in themselves and directed by an individual intelligence. Science then does not as yet supersede the most primitive factors in war, but where one side has the monopoly of its products (or even only of some of them) there should be economy of effort, and consequently of life, which should enable the civilized army to be always on the offensive and to force a favourable decision with great rapidity.

Lessons of 1914–8.—To sum up, then, the experiences of the past war and the effects of the latest discoveries, it would seem that at first the defensive proved to be a far stronger form of warfare than had been anticipated, because, owing to dense populations and good communications, armies could hold continuous lines, with no open flanks. Frontal attacks of the most pronounced kind became unavoidable, and months and even years passed before the attack regained its ascendency. In these conditions there was no scope for the mounted arm, and even the infantry returned to the most primitive form of warfare. Rifle-fire was useless, for it could not kill, and fire which does not kill is wasted. It was then that the infantry had recourse to the bayonet and the bomb, and the long-range fighting of S. Africa ceased to be. Instead, for three whole years infantry tactics were on a lower and less scientific plane than in the Manchurian War, which, in the opinion of many soldiers, was fought out on altogether a lower plane than the S. African War which preceded it. Meanwhile ever-growing demands were made upon the artillery, not only for increased weight of projectile and volume of fire, but for a degree of accuracy which had never before been considered necessary or even possible. So far did the dependence of the infantryman upon artillery support extend that there were some who advocated the abolition of the rifle altogether, since it could no longer kill. Then came two vitally important inventions—first, the instantaneous fuze, which deprived wire of much of its terror, and then tanks, with their combination of mobility and fire. With tanks and artillery, infantry recovered its power of movement, and with movement the rifle recovered its position, for trenches had lost their protective value and once more it could kill in the open. In less civilized warfare we can see that on a narrow space like the Gallipoli peninsula continuous lines were possible, but elsewhere space gave freedom for movement, fire was supreme, and the victor imposed his will by crushing the enemy's field armies. In both forms of warfare it was proved once more that in the end infantry is still the queen of battle, but requires ever more assistance from the other arms and from science.

Now, in this very question of the influence of scientific discovery upon tactics, the World War has taught us much. But need the experience have been quite so bitter? No doubt it is easy to be wise after the event, but we should learn little if we allowed ourselves to be convinced that we were perfectly wise before it. To take only one instance, the enormous expenditure of gun ammunition during the opening weeks of the war had the effect of entirely using up all reserves within a very short time after the opening of hostilities. It is now no secret that by the end of the first battle of Ypres the British artillery was practically without ammunition; guns were rare enough, but even the few there were had nothing to fire. And this was true of all armies. It was not only the weather which stopped the fighting in the middle of Nov.; it was, as well, largely the fact that infantry was almost deprived of artillery support. Moreover, it was just this period of respite which enabled the armies to dig themselves in, and to organize those systems of field fortification which for so long defied assault. Now, this deficiency was due to two causes. In the first place to a short-sighted economy, always in favour of running a risk in order to avoid unpleasant parliamentary criticism—and this tendency exists in all countries; in the second place, it was due to a tendency, which is also universal, to devote too much attention to the past and too little to the future. It is so easy to follow Napoleon's advice, to read and reread the campaigns of the great commanders; it is so easy to store the mind with facts and figures; but it is so difficult to apply the knowledge acquired to the requirements of the future and to breathe life into Dryasdust. This is, perhaps, the most difficult task of the general staffs, which all nations had by 1921 established more or less upon the Moltke model. Every great army has its inventions board, whose duty it is to sift the corn from a vast quantity of useless chaff; but the real trouble is to foresee what the tactical effect of any new discovery may be and how to turn it to advantage upon the field of battle. It is easy to learn by experience, but wonderfully difficult to prophesy. Some instances there have been, notably Wellington's confidence that, with the weapons he had, he could dare to go into battle in new formations giving him unprecedented fire power. By his penetrating insight he gained a very definite advantage over men whose experience in European warfare was infinitely greater than his own, and, by breaking away from the stereotyped lines rendered classic by Frederick the Great and even by Napoleon, British infantry gained a tactical advantage which they retained until Waterloo. It was exactly the same firm and traditional belief in the efficacy of rifle-fire which won the first battle of Ypres, for at least in this respect nothing approaching the training of the British Expeditionary Force had ever been seen in European armies. Similarly, it was Moltke's realization of the power of improved weapons and other developments of science that was the origin of his idea of envelopment, whereby he revolutionized German tactics and crushed the armies of Austria and France. Both commanders took risks which are now difficult to realize, but both were justified, not only by their own victories, but by subsequent history. Wellington and Moltke both had their critics, but there is no one who now doubts the wisdom of linear formations or enveloping tactics.

It is unfortunately impossible to produce a Wellington or a Moltke at will, but the application of the lessons of history to the requirements of the future is at least as important and needs at least as much study as the facts themselves. With each step forward and as science renders more and more services to the great art of war the future becomes more difficult to forecast. In the first place it is evident that, as war becomes more complex, peace manœuvres must become less and less realistic. It is related that Frederick the Great regularly rehearsed the movements with which he intended to beat the Austrians. We are also told that the comment of the victorious Prussian soldiers after Königgrätz was that the battle had been "exactly like the last manœuvres." Something of the same kind might conceivably have been said of Mons or Le Cateau, but certainly not of the Marne or of the first battle of Ypres; still less of the Somme, the German offensive of 1918 or of Aug. 8. For many reasons manœuvres can only last for a strictly limited time, whereas modern battles are almost unlimited in length; for the same reasons troops can be employed only in limited, instead of unlimited, numbers; while for other reasons the convenience of the civil population outweighs the demand for military instruction. To such an extent did civil requirements outweigh military that up to the outbreak of war British troops were not allowed to sleep even in barns or outhouses, although billeting is a most necessary, and by no means easy, military exercise, ignorance and inexperience of which subsequently caused the British army much suffering and fatigue. How infinitely more difficult will it now be to produce anything which shall in any way represent the conditions of a modern battle-field, with trenches, wire entanglements, smoke screens, gas attacks, barrages, aeroplanes and tanks! The thing simply cannot be done. Manœuvres will still be a valuable means of training up to a certain stage; but that stage will be far short of the reality, and must be supplemented in the general staffs by imaginative thought.

That is the first difficulty to be overcome. In the second place invention, which has received so great a stimulus since 1914, will not now stand still. The vital importance of the general staff keeping in close touch with the best and most progressive scientific thought of the day, either through the inventions board, or through any other form of "liaison," can, therefore, require no emphasis. If anything is clear as to the course of future wars between civilized countries it is that success at the outset is half way to ultimate victory. If through more rapid mobilization, a better strategical plan, or both, one side can seize the initiative and drive it home by early tactical success it will be in a winning position from the start. It cannot be denied that, owing to the foundations laid by Moltke, the superstructure built by Schlieffen, and the attention which had for years been paid to the possibilities of machine-gun fire, Germany held an advantage in 1914 which was only wrested from her by "the miracle of the Marne" and by the fact that her ammunition supplies failed her just as did those of England and France. Had German leadership, equipment and tactics in 1914 been equal to those of 1918 it is difficult to believe that Paris would not have fallen in spite of the genius of French and British commanders. And so it seems probable that the next war will open with even greater suddenness and greater violence than the last, with more efficient engines of destruction and more rapid movement. The country that would have its tactical development keep pace with science must, therefore, be prepared to spend money upon experiment; its general staff should have its research department; tactical training and scientific research should together form the latest new Model Army. Indeed, just as during the war every army commander had on his staff his meteorological expert and his chemical adviser, so surely the general staff in peace should have its chemical department, for it is not impossible that the chemist may become as important in war as in every great industrial enterprise.

But there is yet a third reason why future wars will certainly produce unpleasant surprises which may even be revolutionary in their nature. By the Treaty of Versailles the German army was reduced to 100,000 men, but it could not alter the fact that Germany's central position in Europe placed her in a situation in which she believed that she must trust to arms for her existence or go under in the struggle. She has also been trained in the belief that offence is the surest defence. Except that Poland had taken the place of Russia on Germany's eastern frontier, and that the Austrian Empire had disappeared, the military problems of Central Europe remained in 1921 much what they were before 1914. Germany was still an ambitious, industrious nation, with 60,000,000 well-educated and intelligent citizens. On the one frontier lies France, and on the other Poland, both with large armies, and neither of them particularly friendly to Germany. In these circumstances it was only reasonable to assume that her policy would be to avoid war, at least for many years to come. At the same time it was clearly evident that her military problems must give rise to very anxious thought. This spectacle of a rich, densely populated country with an army regulated by treaty is, it is true, not entirely new. The same thing happened after Jena, but with the difference that Germany was not then either rich or densely populated. Nevertheless an answer was found to the restrictions imposed by Napoleon. It need not be the same answer this time, precautions against that having been taken, but there is the alternative that Germany's effort may be to compensate for the numerical weakness imposed upon her by scientific equipment and by bringing new forces into play. The World War showed beyond doubt that, given good leaders, a mass of untrained human beings could quickly be converted into an efficient fighting force. Germany's military aim will, therefore, naturally be to train the 100,000 men she keeps in peace-time to become highly efficient leaders in war. Her war budget will be high per man, for the army must be recruited on a voluntary basis; yet the total sum will not be great compared to that of other countries, and money will be available exactly for those purposes of research and experiment which are seen to be so highly important. Many years must elapse before Europe can have recovered sufficiently from the results of the World War to reproduce the conditions of 1914; and perhaps by that time her peoples may have realized the futility of war as a solution for differences of opinion or interest; but in this respect history is far from encouraging, and all the time there will be in the centre of Europe a nation whose soldiers are thinking out war problems on lines which must inevitably be quite different from those followed by their neighbours. Hitherto all the military nations have thought along similar lines. Sometimes one and sometimes another has thrown up a great genius, the product of whose mind had placed his own country at an advantage; but here we have an entirely new set of problems, the solution of which may lead to new and startling results.

In 1921 there were thus three important factors rendering it more than ordinarily difficult to penetrate the obscurity of the future. First, the impossibility of reproducing in peace-time the conditions of the battle-field as we actually know them; secondly, the effect of scientific research upon tactical evolution; thirdly, the peculiar position of Germany and its repercussion upon military thought. Other factors doubtless exist, for the opening stages of every war bring their own peculiar surprises. All that can be done is so to arrange plans that they may not be too rigid, and may if necessary be adapted to meet the unexpected, just as Joffre in 1914, surprised by the extent and weight of the German turning movement through Belgium, switched his own reserves to his extreme left and produced the counter-stroke of the Marne and the Ourcq. This is merely an example culled rather from strategy than tactics, but it serves to illustrate the fact that, in war, the great contest between brain and brain, it is the unforeseen which happens. The real difficulty is to anticipate the problem rather than to solve it. Never in the history of the world have tactical problems received such close attention and study as during the years just prior to 1914. With one great war just finished and the shadow of another hanging heavily over Europe, discussions on strategy and tactics filled the columns of newspapers and magazines not only of the professional but also of the general press. The general staffs of all nations worked out theories and doctrines of war, and the official handbooks gave the armies the considered opinions of the best military brains in each country. The conflicting systems of envelopment and penetration were weighed and considered, with the result that military training could be classified in two clearly defined systems, sometimes called for convenience the French and the German. The real value and capabilities of quick-firing artillery and the necessary infantry formations with which to meet it were thrashed out in theory, and so far as possible by experiment, for, although the French "75" was already an old gun, its effects had never really been tested on the battle-field. Meanwhile Germany introduced her heavy field howitzer and England her long-range field gun. The probable effect of these new factors in war were weighed, discussed and fairly accurately foreseen. But surprise came elsewhere, for the factor which was neglected was the power of the railways to maintain in the field such armies as the world had never beheld, with what we can now see was only the natural corollary—field fortifications impregnable to the material which armies then possessed, and by their strength and extent rendering impossible both envelopment and penetration. The truth is that it is less difficult to find the correct answer to the questions which are asked by history, experience and such foresight as we possess, than to foretell and ask the really vital questions.

III.—The Art of Leadership

So far we have dealt almost entirely with the mechanism of war, the tactics of 1914–8, and possible future developments. There remains the all-important subject of command, and the qualities which go to make a great commander—the human element—for without true leadership arms and equipment and even training will achieve but little. "With a great general no action is executed which is the fruit of chance or fortune; everything is the result of combination and talent" (Napoleon's War Maxims, No. 82). Such was the considered opinion of the great master of war, and it can be confidently asserted that nothing has happened since he fought his last, and perhaps his most wonderful, campaign in 1815 to shake it. Surely no commander ever took greater risks than did Napoleon in the series of operations which ended at Waterloo, but they were the result of careful study and calculation and they came near to victory over almost double his numbers. Even now who can say what might have happened but for failure of his physical power and energy at the most critical moments, for surely England and Europe were never in greater danger than during the forty-eight hours after the Prussians had been beaten on the field of Ligny. How curious to reflect that a little more than a hundred years later the descendants of those who stood at Waterloo should have fought out another campaign on a vastly greater scale but on very similar lines and on ground not very far distant. The combatants were differently grouped, it is true, but the German blow in March 1918 was directed at the junction of the Allied armies, this time the British and the French, just as in 1815 the French blow was struck at the junction between Wellington and Blücher. Once again the British army was based on northern ports, while her ally was based on inland territory; once more the allies were for a time in danger of retiring along divergent lines and perhaps of defeat in detail. Numbers and weapons were different from those of 1815, but the main features of the campaign and the principles upon which it was fought out were the same. So true it is that the principles of war are simple and eternal, but the application of them varies in each particular case. Never yet has there been a great commander who has not read and thought deeply about his art in order that, by training his instinct on the right lines, he may decide correctly when the supreme hour arrives. It is not in order that we may master the principles of war that Napoleon has advised us to "read and reread the campaigns of Alexander, Hannibal, Gustavus, Turenne, Eugène and Frederick," but in order that we may "obtain the secrets of the art of war," and those secrets lie in application.

How strange, too, that of the great names which will go down to history in connexion with the campaign of 1918 two at least are those of men who had seen little or nothing of war before 1914—Foch and Ludendorff. For more than forty years Foch had no experience of anything but peace soldiering; Ludendorff heard an enemy's rifles and saw his own men drop for the first time in his life near Visé on Aug. 4 1914. Both had mastered every detail of their art, not in the open field but in the solitude of the study. Each in his own way was an artist, but of the two it was Foch who had the inspiration, "the fire in his belly," which is the sign of the true master. Yet it is not enough to follow the movements even of these two, for all wars will not be fought either with the numbers or the weapons of 1918 any more than with the weapons and over the extent of ground of 1815. Something between the two may be found to be nearer to the normal, but when due allowance is made for later invention, surely no campaign is better worth studying than this of 1815. Fought out between two great captains in the space of a few days and over a few miles of country, it forms a very epitome of war in all its branches. The doubt up to the last moment as to Napoleon's intentions; the strategical surprise; a concentrated force with one line of communication operating between two forces with divergent lines; the handling of D'Erlon's force and the attempt to effect a concentration on the battle-field at Ligny; the British and Belgian rearguard action at Quatre Bras and the retreat to Waterloo; Wellington's masterly disposition of troops as contrasted with Blücher's two days earlier; his telling use of advance posts, Hougoumont and La Haye Sainte, breaking up Napoleon's massed attacks; the concentration of forces on the field and the great counter-stroke against Napoleon's right and rear, so largely the result of Blücher's loyalty and force of character; finally the stupendous defeat, the inevitable result of this most difficult manœuvre when successfully accomplished, as it was here, at Königgrätz and on one or two other occasions in history; and the relentless pursuit. They were indeed crowded days of glory. And then Wellington's characteristic comment: "A damned serious business. Blücher and I have lost 30,000 men. It has been a damned nice thing, the nearest run thing you ever saw in your life. . . . By God! I don't think it would have done if I had not been there."[1]

Since those days Moltke has perfected the art of marching to the battle-field, of concentration by many different roads upon a single objective, and we have seen the same manœuvre developed under more difficult circumstances at Liao-yang. Arising from Moltke's tactics, so closely followed by Oyama in Manchuria, there have been many fierce disputes upon the comparative virtues of envelopment and penetration on the battle-field. Yet all these theories, these varying systems and bitter discussions, are based upon one solid foundation, the development of fire; for from the days of the long-bow to those of the modern tank it is to the development of fire that all changes in tactics are directly due. To-day, more than ever before, the power of developing fire is in the hands of the commander who seizes and retains the initiative. This he may do either through superior readiness for war and quicker mobilization, through a better strategical plan, or through superior numbers. In any case he will require superiority in the air, and better, more numerous or more skilfully handled covering troops, cavalry and rapid tanks. Decisive battle will be the object, and the experience of the World War would appear to prove that quick decision can only be obtained through envelopment. Converging lines of communication drawn from widely separated bases may then be a positive advantage, especially since the rapid means of communication now available have overcome much of their danger. Moreover, so devastating is the effect of converging or enfilade fire from modern weapons that the troops exposed to it are in deadly danger. An attacking force, it is true, may conceal an exposed flank by the skilful use of smoke, but not so the defending force, and the increased range and rapidity of modern arms are on the side of the attack rather than of the defence. Each commander will, therefore, strive with all his energy and will power to secure the initiative at the outset of a campaign; every artifice will be used and every engine will be employed. Sooner or later, however, one or other of the combatants will be forced to the defensive, but, if he is master of his art he will not resign himself to his fate any more than did Wellington and Blücher in 1815 or Joffre in 1914. He will devote all his skill and resource to recovering his freedom of action and to assuming that domination over events which will enable him, in his turn, to impose his will upon his adversary.

This change of fortune can only be brought about by a tactical counter-stroke, exactly as was done by the Entente armies in

---

[1] *The Creevy Papers*, vol. i., chap. x.

1914 and again in 1918. On each occasion they aimed at the envelopment of the enemy forces, for the very successes which had brought the Germans so close to Paris afforded to a commander, sufficiently skilful to seize it, the opportunity to deliver an enveloping counter-attack—the very opening he needed. Thus it is clear that even to-day, provided the opposing armies are well led, neither can have the monopoly of enveloping movement or fire development, but that, as has always been the case in war, "everything must be the result of combination and talent." So it is that so soon as a great commander finds that, for one reason or another, the initiative has passed from him he will think only of the counter-offensive whereby he is to regain it. He cannot wait, like Wellington at Salamanca, or Napoleon at Austerlitz, and watch his enemy commit a fatal error, for modern battle-fields are too vast, and mistakes are committed too far from the field of action. His aeroplanes will no doubt bring him much useful information, but before he can turn it to advantage the whole situation may have altered.[1] He cannot, therefore, so plan his battle as to make the action of his reserve, or striking force, dependent upon some chance or fleeting opportunity. Instead he must form some new plan, some new combination of his own, and carry it through with undiminished audacity and resolution. It is, perhaps, this blindness of the commander which has brought about the greatest change of all in modern grand tactics, for he cannot now survey the whole even of his own force, and much more than formerly he is dependent upon his subordinates, who must, in Napoleon's phrase, "understand his system" if he is to be well served.

But there is another aspect of the matter. With weapons of still longer range and greater accuracy than our modern artillery, with small-bore weapons of still greater rapidity of fire than the Maxim or the Lewis gun, fronts will become more and more extended, and the establishment of continuous lines will be possible even to comparatively small armies. It will be easier to use natural obstacles for the protection of flanks, which will become more difficult to find and to turn. In this respect the defence would appear to have gained a distinct advantage over the attack, in that frontal assaults are likely to become more inevitable. The indirect result of the increased volume of fire seems, therefore, to be more important than the direct effect. Against this it is possible to put forward the suggestion that frontal attacks are actually less to be feared than they were. Formerly they had two disadvantages—first, that they were desperately costly in life; secondly, that at the best they resulted merely in the tactical retirement of the enemy, not to his destruction or to any great and decisive strategical result. Now, however, owing to the same increase of fire power which has strengthened the defence, it is possible for the assailant to make all his dispositions for attack out of sight of and unperceived by any enemy who elects to stand purely on the defensive. Little more than a hundred years ago Napoleon drew up his army in front of La Belle Alliance in full view of Wellington on the slopes of Waterloo; a few years earlier Marmont had manœuvred in front of Wellington at Salamanca and met his doom exactly as had Kutusov, for exactly the same reason, at Austerlitz. All this is now changed, and in 1918 Ludendorff showed how, even without command of or even superiority in the air, it is possible for the assailant to make his arrangements for attack without being detected; and this instance is the more remarkable since his intention had been foreseen and his troop movements were at least suspected. It is this power of massing unseen against the portion of the front selected for attack that gives the assailant his principal chance of success, even should the attack not come as a complete surprise. Moreover, the very extension of the front which, by our hypothesis, has rendered the frontal attack inevitable, makes it extremely difficult for the defender to ensure that his reserves are best placed for resistance. Even with superiority in the air and good intelligence, a commander who has lost the initiative and has been forced to stand on the defensive cannot be absolutely certain when the blow will fall. With his widely extended lines, it is more than probable that he has several delicate points to guard, failure at any one of which would give the enemy some considerable strategical advantage. Hence the disposal of the reserves intended to be used for defence becomes a matter of extreme difficulty, and unless the assailant's intention is exactly anticipated, as is not very probable, much priceless time must be lost in moving them to the point of danger, and meanwhile the assailant may have secured an initial advantage of which it will be extremely difficult to deprive him.

This brings us to the second weakness of frontal attacks—the difficulty of winning any real strategical result. That weakness was very real so long as the only result of defeat was to compel an army, as in the Russo-Japanese War, to retire along its line of communications to a fresh position somewhat nearer to its base. But with modern lines, extended even more widely than in Manchuria, a new tactical idea has been evolved. Partly owing to our enlarged ideas on the massing and use of artillery, partly owing to the improved engines of destruction which brought a great accession of strength to the attack, and partly owing to the tactical use of aeroplanes, there grew up that idea of a "break-through" which was completely realized in the World War only in Palestine, but which came near to accomplishment in France in March 1918. But perhaps the factor which contributes most to the chance of a successful "break-through" is that very difficulty in the disposal and handling of reserves to which reference has just been made. In this connexion it must be remembered that tanks have given the attacking force an altogether new power of pushing home an initial success with rapidity and vigour. In place of the slow-moving infantry which laboured painfully through the shell-torn swamps of the Somme or the Passchendaele ridges, we may well see a strong force of tanks, able to move at a steady pace for several hours on end, turning defeat into rout, disorganizing communications and spreading panic before reserves can be brought from distant parts of a widely extended battle-line. Hence it would seem that just those developments which give to the defender the power to defend his flanks and to guard against envelopment have at the same time given to the frontal attack a greater chance of success than it ever had.

In this case it may be asked, How should the commander who has lost the initiative and been compelled to stand on the defensive attempt to recover control of his campaign? The answer is, by exactly the same methods as those by which Foch recovered it in July 1918—that is to say, by counter-attack. There is no other means. And this is true whether the attack be enveloping or frontal, and it is if possible more essentially true than ever before, since, owing to the distance to be covered, reserves which are held for purely defensive action are in great danger of being too late. Not only can they not win a battle; they may well be too late to save it. Thus even the briefest consideration of defence brings us to the old conclusion *that attack must be met by counter-attack, that offence is still the soul of defence, and that the true rôle of the reserves in a defensive action is to convert it into an offensive one.* These are but the oldest principles of battle fighting, true from the days of Alexander the Great until to-day, but always put into practice by new means and new methods. This is the essence of Marshal Foch's own appreciation of Napoleon (London *Times*, May 5 1921):—

> "Often during the darkest days of the war we used to ask ourselves what Napoleon would do with the armies of to-day. . . . This is what he would have said: 'You have millions of men; I never had them. You have railways, telegraphs, wireless, aircraft, long-range artillery, poison gases; I had none of them. Yet you make nothing of them. Stand aside while I show you how to use them.' In a month, or perhaps two, he would have changed everything, reorganized everything, employed everything in some new way, and crushed the bewildered enemy."

There in a few words we have the marshal's views on his great predecessor. It is not that he would have discovered some spectacular and dramatic way of winning the war, but merely that he would have bent scientific discovery to his own ends and put each new invention to its proper tactical use. Thus he would have won battles, and when he had finished his work all would have appeared obvious and simple. That is the way of the artist; and the great tactician is a supreme artist. (N. M.*)

---

[1] Moreover, so many movements will be carried out at night that even the aeroplanes will miss a great deal.

TAFT, LORADO (1860–), American sculptor (*see* 26.354), was elected to the National Academy in 1911. He was director of the American Federation of Arts from 1914 to 1917 and in the latter year was appointed a member of the board of art advisers for the state of Illinois. He received a silver medal at the Panama-Pacific Exposition, San Francisco, 1915. His recent works include: "Black Hawk" (1912, figure of an American Indian, at Oregon, Ill.); Thatcher Memorial Fountain (1918, at Denver, Colo.); and "The Fountain of Time" (1920, at Chicago). In 1921 he published *Recent Tendencies in Sculpture.*

TAFT, WILLIAM HOWARD (1857–), 27th President of the United States (*see* 26.354), antagonized a considerable branch of his own party in 1911 by his endeavour, which proved unsuccessful, to secure a reciprocity agreement with Canada. Meanwhile wide public interest had been awakened in the conservation of national resources and the President's attitude was attacked by the conservationists. In 1909 Gifford Pinchot, chief forester, charged Richard A. Ballinger, Secretary of the Interior, with being opposed to conservation. A Congressional committee, after investigation, exonerated the Secretary, but he later resigned. The attack upon Ballinger was denounced by the President, who continued to be criticized in connexion with the sale of public lands, and who dismissed Pinchot from office. The President lost ground also as a result of a breach of friendship between himself and Theodore Roosevelt, who supported Pinchot. In 1912 the President signed the Panama Tolls bill, exempting American coastwise shipping from tolls; he affirmed that it did not violate the Hay-Pauncefote Treaty, and believed also that the United States had the right to fortify the canal. At the same time he expressed a readiness to arbitrate the question with Great Britain, who had protested. Cleavage within his party was crystallized at the Republican National Convention in 1912. In the pre-convention campaign Roosevelt came forward as leader of the progressive wing against Taft as leader of the conservative or "stand-pat" wing, and the mutual recriminations were bitter. At the convention, however, the conservatives controlled the party machine, and the committee on credentials by arbitrary decisions excluded most of Roosevelt's contesting delegates. Taft was renominated on the first ballot, receiving 561 votes, 21 more than the required majority. Roosevelt denounced the action of the convention and later was nominated by the newly formed National Progressive party. In the ensuing election Woodrow Wilson, the Democratic nominee, won an overwhelming victory, securing 435 electoral votes to 88 for Roosevelt and 8 for Taft. President Taft carried only two states, Utah and Vermont, and those only by small pluralities. The general feeling throughout the country was that President Taft had shown a deplorable lack of administrative firmness, his good nature having caused him to vacillate. On retiring from the presidency in 1913 he became Kent professor of law at Yale, but devoted much time to lecture engagements. In 1913 he was elected president of the American Bar Association, and in 1914 first president of the American Institute of Jurisprudence, organized to improve law and its administration. After the outbreak of the World War in 1914 he supported President Wilson's strong stand for neutrality. In 1915 he approved the Army League's campaign for preparedness. He was an active promoter of the League to Enforce Peace, but after America's entrance into the war he argued that victory was necessary for attaining lasting peace. In 1918 he was appointed by the President a member of the National War Labor Board for arbitrating labour disputes during the war. In 1919 he endorsed the Peace Treaty of Versailles, regarding its most important part to be the Covenant of the League of Nations. He spoke throughout the country in behalf of the League. After the Senate's rejection of the Peace Treaty he urged reservations if these would secure ratification. In July 1920 he was appointed to represent the Grand Trunk railway on the board of arbitration for determining the sum to be paid by the Dominion of Canada when the road was to be made a part of the national system. He supported Warren G. Harding, the Republican candidate for president in 1920. On June 30 1921 he was appointed by President Harding Chief Justice of the Supreme Court to succeed Edward Douglas White, deceased.

He was the author of *Popular Government: its Essence, its Performance, and its Perils* (1913); *The Anti-Trust Act and the Supreme Court* (1914); *The United States and Peace* (1914); *Ethics in Service* (1915, Yale lectures); *Our Chief Magistrate and his Powers* (1916, Columbia lectures) and *The Presidency: its Duties, its Powers, its Opportunities and its Limitations* (1916, lectures at the university of Virginia).

TAGORE, RABINDRANATH (1861–), Indian poet and author, was a member of a well-known Bengali family noted for its activities in literature, art and religious reform as well as for its public benefactions. In 1921 the head of the orthodox Hindu branch was Maharaja Bahadur Sir Prodyot Coomar Tagore (b. 1873), a great-nephew of Prosunno Coomar, who was the first Indian to be nominated to the Viceroy's Legislative Council and founded the Tagore law professorship in the university of Calcutta. The grandfather of Rabindranath was Dwarkanath, "merchant, philanthropist and reformer," who was known to his contemporaries as "Prince Tagore." He visited England in 1842 and again in 1845, sat to D'Orsay for his portrait, and, dying of fever in London in 1846, was buried at Kensal Green. In conjunction with Raja Rammohan Roy he initiated the movement of religious reform which took shape as the Adi Brahmo Somaj. This work was continued by his son Maharshi Devendranath, of whose seven sons, Dwijendranath, the eldest, devoted himself to the study of philosophy; Satyendranath, the second, was the first Indian to enter the covenanted civil service and served for 35 years in the Bombay Presidency; and Jyotirendranath, the third, was an accomplished musician. Their cousins, Abanindranath (b. 1871), Gogonendranath and Narendranath, became distinguished artists. Rabindranath, the youngest son, was sent to England to study law, but soon returned. In 1901 he established the famous Shantiniketan, or abode of peace, at Bolpur, a village 93 m. from Calcutta. Originally organized as an *asram*, or retreat, by the Maharshi, it was developed by Rabindranath into a school conducted on unconventional lines, and he aimed at enlarging it into an international university which should comprehend the whole range of eastern culture. His outlook upon the west was thus summarized by him in a letter published in the Indian press at the close of 1919: "The bulk of English people can never be in a normal state of mind with regard to us, our situation being unnatural, and I am impelled to think that it is best for us to do our own work quietly in our own surroundings." Gandhi's policy of noncoöperation was, however, severely condemned by him as perverted nationalism, "which was making of India a prison," in a letter addressed to the principal of his school at Bolpur in June 1921. He paid frequent visits to Europe, Japan and the United States (where his son Rathindranath became a student in the university of California), and carried through several lecturing tours. His reputation as a writer among his own countrymen was early assured, and the 30 poetical and 28 prose works composed by him in Bengali are now regarded as classics. The English public first became interested in his works in 1912, and his fame rapidly spread. In 1913 he was awarded the Nobel Prize for literature and utilized the whole amount, £8,000, for the upkeep of the school at Bolpur. He was given the degree of Doctor of Letters in the university of Calcutta and accepted a knighthood in 1915, but addressed a letter to the Viceroy in 1919, resigning the title as a protest against the methods adopted for the repression of disturbances in the Punjab.

His more important books, of which English translations have been published, are the poems *Gitanjali* (Song Offerings) (1913), *The Crescent Moon* (1913), *The Gardener* (1913), *Songs of Kabir* (1915), *Fruit Gathering* (1916), *Stray Birds* (1917), *The Lover's Gift and the Crossing* (1918); the plays *Chitra* (1914), *The King of the Dark Chamber* (1914), *The Post Office* (1914), *The Cycle of Spring* (1917), *Sacrifice* (1917), and other plays; the novels, *The Home and the World* (1919), *The Wreck* (1921); as well as a volume of letters, *Glimpses of Bengal* (1921), and the short stories *Hungry Stones*

TANGANYIKA TERRITORY, the name officially given in Jan. 1920 to that part of ex-German East Africa administered by Great Britain. It has an area of some 365,000 sq. m., compared with the 385,000 sq. m. of the former German protectorate, the rest of the region having been added to Belgian Congo except the small Kionga district at the mouth of the Rovuma, which was incorporated in Portuguese East Africa. Urundi and Ruanda, the provinces acquired by Belgium, were the most populous parts of German East Africa, and whereas the population of the German protectorate in 1916 was estimated at some 8,000,000 that of Tanganyika Territory in 1921 was under 5,000,000. Europeans in 1920 numbered about 2,200, of whom 1,400 were British and 300 Greek. The largest towns were Dar es Salaam (20,000 inhabitants) and Tanga (16,400) on the coast, and Tabora (25,000) inland.

With the conquest of the country in 1916–7 civil administrators were appointed by the British and Belgians in the areas they occupied, Mr. (afterwards Sir) H. A. Byatt being chosen by the British. His headquarters were at Dar es Salaam. Iringa, Mahenge and other regions were, until March 1918, administered by Gen. Northey's chief political officer, Mr. (afterwards Sir) H. L. Duff. At first the Belgians, with Col. Malfeyt as Royal Commissioner, administered, from Tabora, the western area from Victoria Nyanza to near the southern end of Tanganyika. In March 1918 the Tabora region was taken over by the British. By decision of the Supreme Council in May 1919 the mandate for German East Africa was assigned, without qualification, to Great Britain, but Belgium advanced claims to retain not only Urundi and Ruanda but a much larger area, including the province of Ujiji, with the lake terminus of the railway from Dar es Salaam. The matter was settled by an Anglo-Belgian agreement signed in Sept. 1919. By this agreement Ujiji province went to Great Britain, and also such parts of Urundi and Ruanda as were needed to allow the projected railway from Tabora to Western Uganda—a link in the Cape to Cairo scheme—to remain in British administered territory. By another convention signed in March 1921 Belgium obtained the right of transit of goods free of all custom duties over the railway from Kigoma (the lake terminus of the line) to Dar es Salaam, and in general by any other route adapted for transit, together with areas (on payment of nominal rent) at both ports for wharfs, bonded warehouses, etc. The districts which Belgium had temporarily administered but which fell within the British mandatory area were formally transferred to the British administration on March 22 1921.

Orders in Council for the government of Tanganyika Territory were made in July 1920. The next month the administrator, Sir Horace Byatt, was gazetted governor and Sir William M. Carter appointed Chief Justice. The terms of the mandate, as proposed by Britain, were made public in March 1921.

In accordance with the terms of the Covenant of the League of Nations the mandatory was bound to allow equality to nationals of all members of the League in matters of residence, trade and commerce. This condition had an important bearing on the position of British Indians in the territory. It prevented any discrimination being made against them, as had been done in the neighbouring colony of Kenya. A proposal had been made during the World War that the territory should become, in effect, a reserve for India. This proposal could not be adopted, but in Aug. 1919 the Colonial Office consulted the Indian Government as to the desirability of setting aside special areas for colonization by Indians. Investigations were made in the territory by Sir Benjamin Robertson, with the result that the Government of India in a despatch dated Feb. 10 1921 stated that it was improbable that Indian farmers would be attracted to Tanganyika, where only large estates seemed likely to succeed.

The Indian Government moreover drew attention to the rights Indians possessed under the mandate and urged that Indians should also be granted perfect political equality with other settlers, of whatever nationality. Indians in Tanganyika numbered in 1921 some 15,000. They had penetrated to every part of the territory, and save for the competition of Greeks in certain areas practically monopolized the retail trade.

The transition period—1918–21—proved difficult, and there was much delay in setting up the new machinery of government. This was in part inevitable, as until the Treaty of Versailles came into force, an event delayed until Jan. 20 1920, the country was still legally German territory. The whole of the German settlers were repatriated and their estates sold during 1921. Until this process was completed no new land grants were made, and agriculture was practically at a standstill. A Land and Mines Department was, however, formed towards the close of 1920, and mining regulations were promulgated early in 1921. The only mineral worked on a considerable scale was mica, the chief deposits being in the Uluguru mountains. Between 1917 and 1920 mica valued at £40,000 was exported for the British Ministry of Munitions. In March 1920 the mines were closed. The alleged indifference of the administration to the needs of the commercial and planting community evoked strong protests, and further difficulties were caused by the change from the German currency in rupees at 15 to the £ to the florin at 10 to the £, preliminary to the substitution of the shilling for the rupee, as in Kenya (*see* KENYA COLONY). The exports and imports for 1917–20, taking the rupee at 15 to the £, were:—

	Imports	Domestic Exports	Re-exports
1917–8	£1,109,000	£591,000	£36,200
1918–9	£1,007,000	£674,000	£26,200
1919–20	£1,158,000	£1,330,000	£96,300

These figures did not include sisal and cotton to the value of £284,000 exported by the custodian of enemy property nor the mica exported for the Ministry of Munitions. The principal exports were sisal, cotton, hides, skins, copra, coffee and ghee. Up to 1920 the exports were mainly accumulated stocks. The chief imports were cotton piece goods, rice and other foodstuffs. The re-exports represented transit trade with the Belgian Congo. Trade was mainly with Zanzibar, Kenya and India. For the year ending March 31 1920 the net tonnage of the ships cleared was 193,000 (154,000 British).

Sir Horace Byatt and his staff had a difficult task in building up a new administration on the ruins of the German system. In native affairs they sought to reëstablish the old tribal organization, almost destroyed under German rule, and steps were taken to abolish slavery. During 1918 and 1919 the Government had to feed large numbers of the people, who, as a result of continued drought, suffered severely from famine. The Indian penal codes were introduced, but it was not until 1921 that civil courts having jurisdiction over non-natives were established. The absence of such courts was not an unmixed evil in this period of transition, though traders, who could not sue for debts, were loud in complaints. But the tendency to wild speculation and to charge high rates of interest was checked. Customs laws—with a general *ad valorem* duty of 10% on imports—similar to those in force in Kenya were introduced before the World War ended, and, in 1921, British weights and measures. Revenue was derived chiefly from the customs dues, trade taxes and licences, and hut and poll taxes, each able-bodied male native paying not fewer than three florins a year. While revenue naturally rose as the area under civil administration increased, so likewise did expenditure. Up to March 31 1920 the total revenue received was £1,596,000, and the total expenditure £1,365,000. It then became necessary to spend much larger sums to put the country into working order, and for the year ending March 31 1921 the Imperial exchequer made a grant of £330,000. For the next financial year the Imperial exchequer made a grant of £914,000—the Colonial Office had asked for £1,500,000. Heavy expense was incurred in making good the damage done during the World War to railways, roads and harbours. The garrison maintained three battalions of the King's African Rifles; cost about £250,000 yearly.

Under British administration the German names given to certain districts and towns were replaced by native names. The following changes were made: Wilhelmstal district became Usambara district and Wilhelmstal (town) Lushoto. Bismarckburg district became Ufipa and Bismarckburg (town) Kasanga. Langenburg district became Rungwe and Neu Langenburg (town) Ntukuyu. Wiedhafen, on Lake Nyasa, became Manda. In 1917 Oldoinyo Lengai (God's mountain) at the S. end of Lake Natron was in frequent eruption; it is the only known active volcano in the territory. In May and June 1919 very severe earthquakes occurred in the S.W. part of the territory. By the fall of the side of a mountain near the N.E. end of Lake Nyasa some 5,000,000 tons of earth and rocks were displaced: the falls in the Livingstone mountains altered considerably the face of the country.

TANKS.—The name "Tank," applied during the World War to a bullet-proof, armed, track-driven, climbing, automobile, machine-gun destroyer, was first given to an engine of war in Dec. 1915, as a blind to conceal the true nature of the experimental fighting machine then being secretly constructed in England. After the first appearance of the machine in the field in Sept. 1916, the word was universally adopted. It is here used to describe all armed and armoured automobiles of a fighting type propelled on the caterpillar system. To the British is due the credit of first conceiving and introducing this weapon, which was destined to exert a decisive influence on the course of the war on land.

The conditions responsible for the birth of the tank were not in principle new. They were the same as have always existed in war, but intensified by the application of modern methods to the situation unexpectedly created by the course of the land campaign on the western front. Neither the strategic development nor the outcome of its full tactical exploitation had been foreseen. It was owing to this that so vital a factor as the tank proved to be should have had to be improvised during the course of hostilities as the solution of an age-old problem. The problem was that of giving effective assistance, in the shape of direct protection, to infantry advancing under fire.

Apart from coöperation elsewhere, assistance can be given in two ways. It can be effected either by artillery, which with its power of long range action can support advancing infantrymen whilst in motion, and therefore unable to make full use of their rifles, by shooting over their heads, or more directly by the provision of some form of physical protection against blows or missiles. The attempt to provide protection whilst retaining the power of movement both for hand-to-hand fighting and also against missiles, as opposed to that afforded by fortification to troops when stationary, has recurred throughout the history of warfare. The best known examples of it are the shield and body armour carried or worn by the man. Though the need for these did not then cease, their practicability was terminated by the introduction of firearms, since no weight of material that the human being or the horse could carry was of avail against missiles propelled by the force of powder. There was also the idea of giving wheel-borne collective protection to several men at a time, and devices for doing this have been numerous, and have varied according to the progress of mechanical knowledge and the resources available at the moment.

The Assyrians made use of war chariots, or mobile fortresses, which were adopted from them by the Egyptians and Israelites.[1] Chariots were also employed by the Chinese in 1200 B.C. Then, for siege warfare, there were the Roman *Testudo*, or "Tortoise," and the mediæval *Beaufroi*, or "Belfry," which was usually assisted by the "Cat" or "Sow," an engine of a more mobile type. About 1400 A.D. Conrad Kyeser wrote on this subject, and some 20 years later Fontana and Archinger designed cars, the latter a large machine to carry 100 men. In the middle of the 15th century appeared the "Scottish War Carts," known also as "Tudor War Carts." In 1472 one Valturio designed a machine to be propelled by wind sails. In 1482 Leonardo da Vinci wrote to Ludivico Sforza describing a machine which, except in motive power, was in essentials the counterpart of the tank. A battle car was designed for the Emperor Maximilian I., and in 1558 Holzschuher described one for use with infantry and cavalry. Eleven years later two land battleships are stated to have been built by Simon Stevin for the Prince of Orange. Except those propelled by the wind, all the above were moved by the muscular power of men or horses. In 1634 David Ramsey took out an English patent for a self-moving car, and Caspar Schott designed one for use against the Turks. In 1769 Cugnot, a Frenchman, actually constructed a steam-driven road car which could be used in war; and later Napoleon wrote a paper on the subject of the automobile in war. In 1855 James Cowan, in England took out provisional protection for a "locomotive battery fitted with scythes to mow down infantry," and endeavoured to persuade Lord Palmerston to take up this adaptation of the chariot. Capt. Nadar put forward a similar suggestion in 1870; and in 1900 John Fowler, of Leeds, produced armoured steam traction engines for S. Africa.

The introduction of rifled breech-loading firearms did not force into use any system of man-borne or horse-borne protection, notwithstanding that the range, volume and accuracy of all kinds of fire was immensely increased and its effect rendered correspondingly more deadly. For, it was less possible than it had been to produce shields or body armour which were capable of resisting the greater penetration of the rifle bullet and yet light enough to be carried; whilst no practical method of mechanical propulsion across country of the heavy weights involved in collective protection had been discovered. And yet, as time passed, the need for some more intimate form of help for the infantry soldier than that afforded by artillery grew more insistent. It was accentuated by the invention of the machine-gun and of the magazine and the automatic rifle, and by every successive improvement in small arms or artillery. In point of fact, however, the mechanical difficulties had been overcome some years before 1914. The "caterpillar," or "track," or "endless band" system of propulsion, by which weight is distributed by the increase of the surface bearing on the earth, instead of being concentrated, as with a wheel, and a better tractive effect obtained, which had been known, and in the United States largely employed, for some years, had furnished the key to cross-country mobility; and the perfecting of the internal combustion engine had subsequently given to the world compact power with light weight.

The principle of the "footed wheel," "caterpillar," or "track" system of propulsion appears to have originated in the patent of Richard Lovell Edgeworth in 1770 for a device whereby a portable railway could be attached to a wheeled carriage.[2] This employed the basic principle of all subsequent track-driven machines. Then followed patents for tracks of different natures, by Thomas German in 1801, William Palmer in 1812, John Richard Barry in 1821. In 1846 there was the Boydell engine, with footed wheels, improved upon by Andrew Dunlop in 1861; whilst in 1882 Guillaume Fender and John Newburn designed modifications of tracks. In the following year the actual use of tank-like engines for war was predicted by M. Albert Robeida in *La Caricature*.[3] In 1886 there came the Applegarth tractor, and the Batter tractor was patented in the United States two years later. The latter anticipated the tank in many details. All the above machines were steam propelled. In America steam locomotives with caterpillar tracks, some furnished with sleds or runners, had for years before the war been applied to haulage in lumber camps. After the appearance of the petrol engine Frank Bramond patented in 1900 a special form of track for pneumatic tired wheels. In 1907 a Rochet-Schneider car fitted with a chain track was tried for military traction purposes, and in 1908 a 70 H.P. Hornsby-Ackroyd chain track tractor took part in a review at Aldershot, and Hornsby also demonstrated a 75 H.P. Mercèdes motor car fitted with tracks, a speed of 20 m. an hour being attained on sand. Another British tractor, of the footed wheel type, was the Diplock Pedrail. In America petrol-driven caterpillar tractors had before the war become quite common for agricultural purposes, amongst them being the Bullock, Killen Strait and Holt tractors.

While experiments in petrol-driven caterpillar-track tractors for military use had been carried out by the British authorities before the war, there had been no serious investigation or proposal by any nation to develop the caterpillar principle for fighting as opposed to transport purposes. In 1903 Mr. H. G. Wells had in fiction anticipated the intervention in battle of fighting machines which amounted to large-size tanks. Five years later Capt. T. G. Tulloch had suggested a scheme for a steam-driven pedrail armed and armoured trench-crossing machine, and in 1911 had put forward a proposal to use armed and armoured linked Hornsby-Ackroyd tractors with a crew of a hundred men. And in 1912 Mr. L. E. de Mole, an Australian, actually placed before the War Office a design, followed in 1916 by a model, for a climbing, fighting track-driven machine. This was the real prototype of the tank; and in some particulars, especially its pivoted ends and flexible chain tracks for steering a curved course, it seems to have been superior to the machine actually produced. Unfortunately, whatever may have been official opinions or intentions in regard to this scheme, no action was taken.[4] In Dec. 1915 a caterpillar-track wire-cutter, invented by M. J. L. Breton, the French deputy, and called the *Tracteur-porte-cisaille*, or *Tracteur Breton*, was tried, and orders were given for a few, which, however, were not constructed. The *Boirault* cross-country motor, which consisted of an articulated polygon, was also tried, but was found impracticable owing to lack of steering power.

In the years preceding 1914, military opinion generally inclined to the belief that in any future struggle open warfare, or a "war of movement," alone was probable; that in such a campaign mobility was the essential; and that there would not be many occasions when a sheer unassisted frontal attack would have to be pressed to the end against carefully prepared positions held by unshaken defenders. It was appreciated that such operations if attempted would be costly to the infantry, though how costly was not realized. And it was thought that they could usually be avoided by manœuvre, or, if they had to be carried out, would be assisted by envelopment or flank action which would relieve the task of the infantry by weakening the power or determination of the defence to fight to the end, or by operating at night or by surprise. The other, local, measures for assisting the infantry consisted of the bombardment and supporting fire of the attacking artillery up to the moment of actual assault, and the covering rifle fire from stationary infantry to cover those who could not use their rifles whilst actually moving forward, both of which were intended to keep down the defenders' fire. Great and, as it proved, undue reliance was placed on this concentration of the fire-power of the attack both from artillery and from small arms. It was hoped that by the continual cumulative reinforcement of the firing line until it had arrived at assaulting distance, and possibly dug itself in, a superiority of fire over the defenders would be gained sufficient to permit of the delivery—helped by artillery till the last moment—of the final assault with the bayonet. To enable the firing line to improvise some sort of protection when it could no longer move forward and was "frozen" to the ground, the infantry of all armies were equipped with a portable entrenching tool. The blade of this instrument, it was thought, also, might in some cases serve as a species of shield. Except by the Germans, wide extension of the attacking infantry was relied on to reduce the casualties. The Germans favoured mass tactics, trusting to break through by weight of numbers in spite of loss.

---

[1] The greater part of this historical summary is taken from *Tanks in the Great War* by Brvt.-Col. J. F. C. Fuller, and *The Forerunner of the Tank* by H. M. Manchester, *The American Mechanist*, Vol. xlix. No. 15.

[4] Mr. de Mole's ideas had no influence on the evolution of the tank, for the originators of the latter were ignorant of his project, which only became generally known after the war, in Oct. 1919, some four years after the Mark I. tank was designed, when the subject came up before the Royal Commission on Awards to Inventors.

Up to the outbreak of the war, therefore, partly owing to a wrong estimate of possibilities; to a non-appreciation of the progress of science in its application to warfare; to fallacious reasoning based thereon; to the necessity for economy in military matters; and to the mechanical difficulties which had so long stood in the way and which were still thought to stand in the way, not only had no solution of the problem of providing mobile protection been arrived at, but no serious effort to reach a solution had for a long period been attempted. It followed that when hostilities opened in 1914, save for the development of artillery tactics and *matériel*, not one of the combatants was really in possession of better means of rendering possible the advance of infantry under fire than those which had been at the disposal of the opposing forces in the Russo-Japanese War of 1904–5. Indeed, in face of the actual growth in strength of the tactical defensive all armies were in this direction relatively weaker than in previous wars of modern days. And the weakness seems to have caused no anxiety. The prevailing complacency, however, was soon to receive a rude awakening.

It might be imagined, since the Germans first assumed the offensive on the western front, that they would have been the first to become aware of this deficiency and to feel the need for mobile protection. This was not so. Though they carried out a succession of attacks during the first month of the war they were not held up, except for a short time before the fortresses Liége, Namur, Maubeuge, and Antwerp, which they reduced by gunfire, and were able until they reached the Marne to continue their onward rush and to maintain their pressure. These attacks, with the exception of the abortive assault on Liége, were not executed against carefully prepared positions such as developed later, and were not usually of a purely frontal nature unassisted by tactical or threatened strategic flank operations or envelopment. Nevertheless, the German losses were extremely heavy, probably more severe than had been expected, but were thought to be the price of the apparent general success of their strategy at the time. They would have been truly justified had the German plan of campaign in fact succeeded. During this period such losses as they suffered were caused mostly by the quick-firing field artillery of the French on the one hand, and on the other by the musketry of the highly trained long-service British infantry hastily entrenched in improvised positions. This, it is stated, was so intense as to lead to the erroneous conclusion that the British Expeditionary Force had been secretly and lavishly equipped with machine-guns. And it was not owing to the strength of the resistance of the British or French field armies on the defensive that the progress of the Germans was finally brought to a standstill at the Marne.

It was only when the rôles of the two sides were reversed and the Allies assumed the offensive that the factors first came into play that eventually forced on them a fresh effort to solve the ancient problem. It was then, so far as the British were concerned, that it became apparent that, notwithstanding the weakness shown by permanent forts which had quickly succumbed to the power of specially designed ordnance, not only had the capacity for passive resistance of field defences been much increased, but the active power of the defensive had been very greatly enhanced by the application of modern methods and the scientific employment of modern arms.

More than a hint of this was given first by the nature of the resistance made by the German rear-guards during the battle of the Marne, notably at the crossing of that river at La Ferté-sous-Jouarre on Sept. 9, where the British 4th Div. was held up almost entirely by machine-gun fire in its endeavour to force the passage. It has since become known that the Germans had concentrated at this spot some 42 machine-guns, equivalent to the number of these weapons with 21 British battalions.[1] Later, during the fighting on the Aisne, greatly as the British were harassed by the German weight of artillery, it was mostly by machine-guns that their efforts to advance were checked, in some instances by the combined action of these guns and obstacles, such as abattis and wire entanglements, which though improvised, were found to be very effective, especially in view of the British weakness in artillery. Even at this early stage so strong were the German defences that the nature of the operations began to approximate to that of siege warfare. Later, at the beginning of Oct., in the more open action when the British endeavoured to outflank the German right to the north of Lille it was the same story. Their progress was in every direction opposed by machine-guns, sometimes in the open, sometimes in defended villages or houses, and often protected by improvised entanglements. Almost invariably the presence of German advance troops even in small bodies implied the presence of machine-guns which were handled with the greatest skill. The static warfare which then ensued on the western front during the winter of 1914–5 after the failure of the German offensive and the efforts of both sides to outflank each other on the coast, only accentuated the tendencies already noted. Its effect was to convert the struggle into a species of "field siege" warfare from which all possibility of manœuvre was excluded and in which all efforts at the offensive had perforce to be attempts to break through, entailing frontal attacks. Nevertheless, though this development had been expected by the Germans no more than by the Allies, and their immense preparations had been based on their original plan of an overwhelming and short offensive campaign on this front, they were in many ways well equipped for it. They were for a long time in possession of an immensely preponderating artillery—an advantage in attack or defence; whilst in defence the nature of the fighting gave full scope to their untiring industry backed up by their genius for field fortification. They also had a great proportion of technical troops and an armament of machine-guns far superior to that of the Allies. Though the relative conditions between the sides in these particulars changed, in the struggle which lasted for nearly four years the defensive was for a long time to prove stronger than the offensive, all attempts at which had to be carried out without finesse, by the method of brute force with its prodigal loss of life. It was during this period more especially that the machine-gun was to exert its influence and to reveal to the full its true power in the prepared defensive.

The machine-gun was no new invention, but its possibilities when cleverly used in numbers, though shown to some extent in the Russo-Japanese War of 1904–5, had not been proved. The British and German were equipped with almost identical types of the same gun differing only in detail, both being the outcome of the genius of the late Sir Hiram Maxim.[2] Previous to the Russo-Japanese War the weapon had never been held in great esteem by the British military authorities, except by a few enthusiasts; but the lessons of that campaign had led to an effort to increase the proportion of these guns in the equipment of the army beyond that which existed at the time of the S. African War. But this was not done owing to mistaken ideas of economy. It was also held that superior musketry fire discipline would make up for any deficiency in this respect, and great pains were taken to train the infantry to attain a rate of fire which in fact did exceed that of any other troops. On the other hand the machine-gun had become the weapon *par excellence* of the Germans. They perhaps of all nations had most correctly gauged its worth, the fact that it combined the maximum of killing power with the minimum of vulnerability, and the economy in a military sense of its adoption on a large scale. And after the Russo-Japanese War they had made a specialty of it. Without ostentatiously increasing the proportion of machine-guns with their infantry formations they had armed special units with them and accumulated a large stock in reserve. They had also trained a body of picked officers and men in their technical and tactical use. Their army, therefore, entered the war in this particular better equipped than any other. The first sign of this fact was given by the bold method in which they employed machine-guns in their onrush in the west. The next, as has been said, was the skilful way in which they used them in defence, at first in rear-guard operations, and then in the prepared defensive. In these tactics they excelled, and specialized in combining the intense fire power of the machine-gun with the obstacle—usually barbed wire entanglements—in a way which had never before been done. So far from the weapon being looked upon as a rare article impossible of replacement to be cherished and kept out of danger, it was not considered a disgrace for a gun to be lost once it had earned its value in killing the enemy. This apparent prodigality was a measure of the reserve of weapons available and the chief source of the great increase revealed in the strength of the defensive. The pre-war policy of the Germans was justified in the event. It was the combination of this weapon with barbed wire as initiated by them that suggested the need for the tank. And it was its intensive application and elaboration after the opposing armies had crystallized in two continuous closely opposing lines of carefully entrenched positions extending from the sea to Switzerland, that eventually brought the tank into being.

[2] The British were equipped with the Vickers, the French with the Hotchkiss, and the Germans with the Vickers-Maxim.

BRITISH TANKS

Early in Oct. 1914, it was borne in on the mind of a British officer who had special opportunities for ascertaining what was actually occurring, that the frontal assault of prepared positions, especially when adequate artillery coöperation was not available, had become impossible unless some more effective assistance could be rendered to the infantry than that previously contemplated and accepted as adequate; that this assistance in the absence of gun power and ammunition sufficient to blast a way through the whole enemy system of defences—trenches, obstacles and machine-guns—should consist of some protected power-driven machine which could force itself through barbed wire, climb across trenches and destroy by gunfire or crush by its weight the machine-guns of the defence. Knowing of the existence and cross-country capabilities of the American Holt caterpillar tractor, it occurred to him that a specially designed machine developed on similar lines would be the solution of the problem. This officer, Lt.-Col. (later Maj.-Gen.) E. D. Swinton, R.E., at that time acting as official military correspondent ("Eyewitness") with the British Expeditionary Force, was the first officially to put forward a scheme for a caterpillar machine-gun destroyer, in a communication to the Secretary of the Committee of Imperial Defence in London on Oct. 20 1914.[1] Though the machine then contemplated and finally evolved was for the purpose of giving infantry protection when advancing, it was expressly designed to do this indirectly, by its own offensive and destructive action. It was definitely intended, and designed, for the express purpose of forcing its way through wire and crossing trenches and hunting for machine-guns in order to destroy them by shell fire or to crush them by passing over them. The only "protection"—using the word in its limited, and more usually accepted sense—afforded by it was that of its bullet-proof sides to its own fighting crew. This point is accentuated because of the misconceptions which have existed as to the rôle of the tank, chiefly as to its being an armoured vehicle for transporting men, or a mobile shield to give cover to those moving up behind it. It did in fact perform this latter service, but only incidentally, in its quest for machine-guns. Machines for carrying up bodies of infantry and stores were not actually developed until three years later as an extension of the principle. As will be seen, the necessity for finding some mechanical method of carrying troops under cover across country had already occurred independently to a French officer. And in England similar suggestions were put forward, also independently, by Lt. R. F. Macfie, in Aug., and Lt. B. J. F. Bentley in Oct. 1914.

The history of the tank from Oct. 1914, until it took the field 23 months later, and even afterwards, is a record of progress made often in the face of apathy, scepticism and even opposition. This is typical of the history of the evolution of most inventions or new ideas, but is somewhat remarkable in this instance because the subject was one of vital urgency immediately concerning the lives of the British troops in the field. It is also remarkable for another reason. The idea of this land weapon not only received its first help toward realization from the minister responsible for the navy, but its realization was, indeed, only rendered possible by the financial support given by him from naval funds. The gist of the suggestion made to the Secretary of the Committee of Imperial Defence in Oct. 1914 was put forward by him in a memorandum and reached the First Lord of the Admiralty, Mr. Winston Churchill, who was predisposed towards experiments in the direction of some mechanical armoured device for carrying troops across country, to take the place of the armoured motor car which could only operate on roads. A certain number of these cars, belonging to the armoured car section of the Royal Naval Air Service, organized by the Admiralty, had been operating in France and Belgium, and their utility had become seriously curtailed by the destruction of the roads and the state of trench warfare which had arisen. In Jan. 1915, the First Lord, to whom the employment of mobile bullet-proof shields had already been suggested, took up the question of the urgent need for methods of meeting the deadlock reached on land, and his views were officially brought to the notice of the army authorities. He did not, however, only place the matter before the military. He caused researches to be made in the direction of crossing trenches by means of tractors carrying portable bridges, and in Feb. summoned a special Admiralty expert committee under the chairmanship of Mr. (later Sir) E. H. Tennyson d'Eyncourt, the Director of Naval Construction, to explore further the subject of mechanical cross-country transport generally. This committee at once started work and continued its labour for some time, experimenting chiefly in the direction of "landships" with large wheels, coupled steam rollers, pedrail and caterpillar tractors, single and articulated, for which suggestions had been put forward by different individuals. The underlying idea of all these investigations was the production of a machine for the conveyance of troops, not a machine-gun destroyer.

Previous to the receipt of the First Lord's views, the need of a specific machine-gun destroyer had been urged on the War Office directly by Col. Swinton early in Jan. 1915, followed by representations from Capt. Tulloch. The War Office took the matter up, but did not associate itself with outside technical experts to investigate possibilities, as had been recommended. After the trial and failure in Feb. of a Holt caterpillar tractor to cross obstacles which it was not designed to negotiate, and that of a wheeled tractor with the naval trench bridging device in May, it dropped the whole idea as impracticable. Meanwhile the Admiralty committee had continued its experiments, though without knowledge of the conditions of the military problems it was required to solve. In June, the War Office, then aware of the Admiralty's activities, became desirous of collaborating in them, and a joint naval and military committee was formed. The efforts of the Admiralty thus obtained the first official recognition of the service for whose benefit it was really working. At the end of the month the committee was furnished by the War Office with a detailed specification of the requirements of the destroyer as prepared by Col. Swinton and forwarded by the Commander-in-Chief in France, and the Admiralty designers were for the first time in a position to apply their inventive faculties to fulfilling certain definite conditions. The result of their efforts was the production in Jan. 1916 of an experimental machine paid for entirely from naval funds and produced almost entirely by naval agency, which was the prototype of all British machines. The chief point of its design, and on which it differed from other caterpillar machines, was its rhomboidal shape and all-round track, which were the invention of Lt. (later Lt.-Col.) W. G. Wilson, of the Admiralty landships committee, working in conjunction with Mr. (later Sir) W. Tritton. This machine, afterwards known as the Mark I. Tank, successfully underwent its official trials on Feb. 2.[2]

As has been said, at the beginning of the war the solution of the problem of enabling a frontal attack on trenches to be carried out had been thought to lie very largely in bombardment by artillery. But the futility of the limited bombardment by field guns with shrapnel shell, which was all that was possible for some months even against such comparatively weak defences as the Germans at first held, became apparent. Then, in reply to the insistent demand from the front the national energies had been turned to the making of guns and ammunition of all types, and prodigious quantities had been produced. But after the battle of Loos it began to be realized that even a great concentration of artillery and the expenditure of an immense amount of ammunition in a prolonged bombardment from guns of all calibres was not necessarily effective against such defences as the Germans had created, and could not insure that the assaulting infantry would not be held up by uncut wire and suffer terrible loss from concealed and protected machine-guns. Some other means of dealing with the numbers of these weapons which would survive a bombardment even of the heaviest nature was necessary. As a result of the performance of the experimental tank in Feb. 1915, G.H.Q. France came to the conclusion that such machines might be of some assistance, and made a demand for 40.[1] This number was increased by the British War Office to 100, and supply was undertaken by the Tank Supply Committee of the Ministry of Munitions, composed of members representing interests directly concerned, under the chairmanship of Maj. (later Sir) Albert Stern. Orders were placed on Feb. 12, and production was commenced at once with the utmost secrecy, under great difficulties of labour and material owing to the great national effort then in full swing to produce munitions of all sorts.

---

[1] For the origin of the tank see the Minutes of the Proceedings before the Royal Commission on Awards to Inventors, Oct. 1919.

[2] For purposes of secrecy the name "Tank" had been applied in Dec. 1915 to the experimental machine under construction, then known as a "landship," in a report by a sub-committee of the committee of Imperial Defence. It was suggested by two officers connected with that committee. The experimental machine was afterwards known as Big Willie, and, though a male, as "Mother."

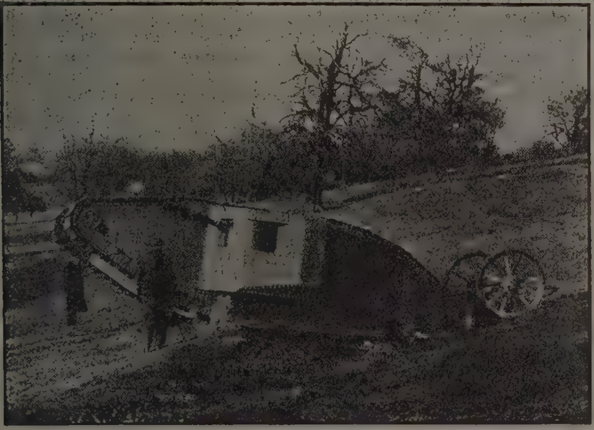

FIG. 1.—Mark I. Tank.

During this initial period of manufacture various minor improvements of the original design were incorporated. The sample machine, in accordance with the original specification for a machine-gun destroyer, was armed with two 6-pdr. guns and three Hotchkiss machine-guns. It was soon realized that, though effective for its purpose, this armament was deficient in man-killing fire-power for self-defence in the event of attack by large numbers of men, and it was decided to arm a certain proportion of tanks with four Vickers machine-guns instead of two 6-pounders. They were known as "females," the gunned machines being known as "males." The total number under construction was 150, half males and half females.

The Mark I. Tank (*see* figs. 1 and 2).—Details of this machine are given in the table on p. 697, but since all the succeeding machines were a development of it, some further description is given. Its main characteristic was the all-round track, which gave it its climbing power. This was perpetuated in all the British heavy tanks, though in the medium, or "Whippet," tanks evolved later, the same result was obtained by the projection of the tracks which were not under the machine. The essential value of both forms of construction was that whatever the fore and aft angle of the machine with the horizontal a gripping surface was presented. This was achieved by the high, curved bows, rendered possible by combining the body and the chassis of the machine and using the sides of the body to support the tracks. The length was 32 ft. 6 in., over all, and 21 ft. 5 in. without the tail. The width was 13 ft. 9 in.; the height 8 ft. ½ inch. Power was given by a six-cylinder sleeve valve Daimler engine of 105 H.P.; transmission consisted of a cone clutch, primary (two speed) gear box (controlled by the driver) differential secondary (two speed) gears, actuated by hand levers, one to each track, and chain drives to the driving sprockets at the rear of each track. There were thus four speeds ahead. This system necessitated a "gearsman" at each side, and was inconvenient and clumsy. The petrol feed was by gravity. There was no silencer. The armour plate varied from 12 mm. thickness in front to 6 mm. at the top and on the belly, the only part proof against the German "K" (armour-piercing) bullet being that 12 mm. thick. The armament of the male tank comprised two 6-pdr. guns, one on each side and four Hotchkiss machine-guns, and that of the female tank two Vickers machine-guns on each side and three Hotchkiss machine-guns. Owing to the pressure of time certain details in the design and equipment of the machine were adopted in order to employ material which was in production and quickly obtainable without waiting for special manufacture. The power unit, including the engine, with gear-box and differential was adopted because it was the standard power unit of an existing tractor and already in production. The 6-pdr. gun was adopted not because it was considered the best for dealing with machine-guns (the 2-pdr. automatic gun was originally specified), but because the Admiralty had a large number of these guns in hand and promised to supply the requisite number to the army. The 6-pdr. proved, however, to be a very good weapon for its purpose. The male tank carried 324 rounds of 6-pdr. common shell for the 6-pdr. gun and 6,272 rounds of S. A. A.; the female carried 31,232 rounds of S.A.A.[2] The crew consisted of one officer and seven other ranks. The driver sat with the officer in the conning tower in front. The total weight of the male tank when loaded was 28 tons; of the female 27 tons. The average speed across country was 2 m. per hour, and the radius of action, nominally 23 m., averaged 12 m. over rough ground. The

[1] The first order placed by the French army headquarters, without awaiting the construction of an experimental machine was for 400 machines, and this was increased to 800.

[2] It was originally proposed to carry a certain proportion of case shot. This was not done, but it was found necessary later to do this,

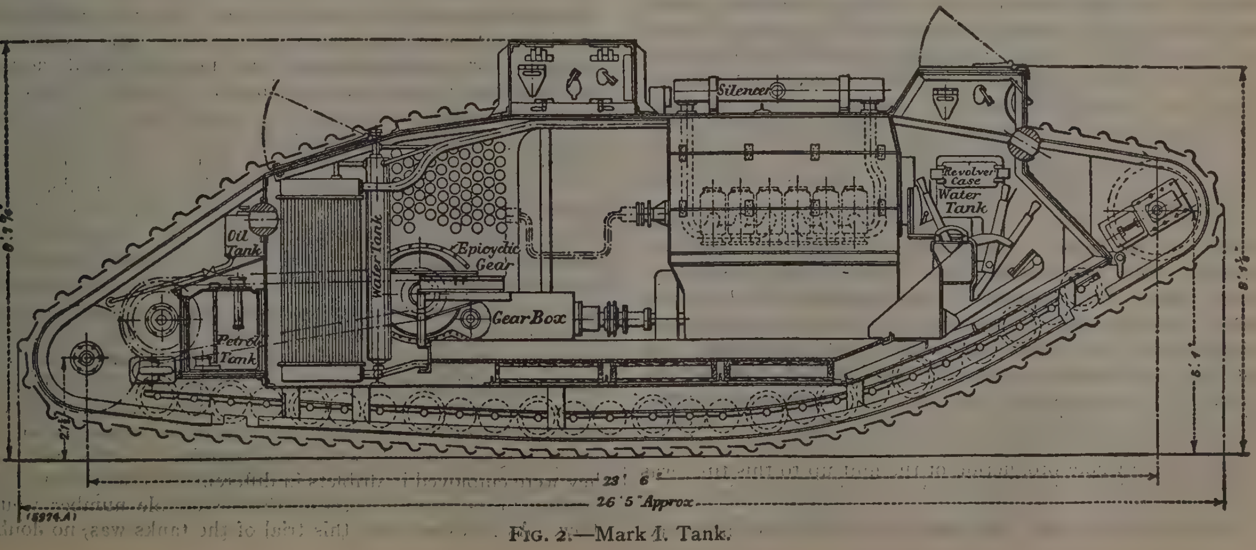

FIG. 2.—Mark I. Tank.

tank could cross trenches up to 11 ft. 6 in. in width and could climb a vertical height up to 5 feet. Six of the first establishments of tanks were equipped with a wireless set capable of sending and also to some degree of receiving.[1]

Two features of the Mark I. tank were not perpetuated in later patterns, except in the first gun-carrier machines. One was the tail. This consisted of a pair of wheels carried by a frame pivoted at the stern of the machine which for ordinary steering could be actuated by the driver by means of wire cables. For sharp turns, which were effected by driving on one track alone, they could be raised off the surface of the ground by a hydraulic ram at the back of the tank. The weight of this tail attachment also served to ease the rate of descent of the tank after crossing a summit, and the extra length it gave to the whole machine increased the width of the gap which could be crossed. It was found in actual practice that the complication and liability to damage the tail was not compensated for by its advantages, and its use was abandoned after the first actions. In both the male and female Mark I. machines the 6-pdr. and Vickers machine-guns were mounted in sponsons to give as far as possible arcs of fire up to direct ahead and astern. In order to reduce the width so that the tanks could be carried by rail these sponsons were removable and could be unshipped for travelling, when they were carried on small wheeled trollies. The inconvenience of this system caused it to be abandoned, and in later patterns of tank the sponsons were so designed that when travelling they could be swung inwards and housed in the width of the tank, or could be unbolted and slid in.

In March 1916, measures were taken to provide the *personnel* to handle the new weapon, and an establishment was framed for a unit. For secrecy this unit, under the command of Col. Swinton, was raised and formed, as a portion of an existing service, under the name of the "Heavy Section," subsequently changed to "Heavy Branch," of the Machine-Gun Corps. This was to provide the *personnel* for the 150 tanks then under construction, without any reserve of machines or man-power. At first the organization was for three battalions of 50 tanks each, but this was altered to six companies of 25 tanks each, each company consisting of four sections of six tanks and one spare tank. Each section was formed of three male and three female machines, and was subdivided into three sub-sections of one male and one female tank. A specially constructed and equipped mobile field workshop was allotted to each two companies. To assist in the formation of this unit a nucleus of officers and men were transferred from the existing Motor Machine-Gun Corps; officers also being obtained from the cadet battalions, and from France, and other ranks being enlisted from the motor trade. Technical *personnel* of all ranks was supplied by the Mechanical Transport Branch of the Royal Army Service Corps.

The first headquarters of the Heavy Branch were at Bisley, where, since there were no machines, the training was of a preliminary nature confined to discipline and gunnery and the use of the Vickers and Hotchkiss machine-guns. Training in gunnery was carried out by means of borrowed guns, and entailed the sending of the men to Salisbury Plain and to the Naval School of Gunnery at Whale Island. So soon as the tanks began to be delivered from the contractors, the training in driving, tactics and shooting from tanks etc., was carried on in a secret area at Elveden in Suffolk, where a facsimile battlefield had been prepared. The whole of this work was carried out under immense difficulties as regards time and the need for secrecy, the main underlying idea of all the preparation being that the rôle of the unit was to assist and help the infantry. By the beginning of Aug. several machines had been delivered, and a certain amount of training in their use had been carried out.

Meanwhile, the Somme offensive having come to a standstill in spite of the power of the British artillery then available, it was decided to use the tanks, or whatever of them were ready, in the renewal of the attack. Two companies of the heavy branch, 50 tanks with 10 spare machines, were accordingly concentrated in France for this purpose by the end of Aug., and training was continued preparatory to taking part in operations. Friday, Sept. 15, was to mark the appearance of the tank in warfare, when the secret of the new weapon which had been so carefully kept would be revealed and the weapon itself put to the test. The whole production of the unit up to this time was a remarkable feat. Not only had a number of entirely new machines been manufactured sufficient for 60 to take the field within six months of the order for them having been placed at a time of great industrial stress, but the secret of their creation, which was known to thousands, had been so well kept that they did actually come as a surprise to the enemy.

It was to assist in the further advance of the British right flank, which had begun so successfully at the opening of the battle 10 weeks before, between the Somme and the Ancre that the tanks were to be thrown into the fight. The IV. Army was to break through the enemy's front between the Combles ravine and Martinpuich and seize Morval, Les Boeufs, Gueudecourt and Flers. On its left the Reserve V. Army was to attack and gain Martinpuich and Courcelette while the French were to press on its right. The cavalry were to follow up through the gap which it was hoped would be created and seize the high ground about Rocquigny–Villers au Flos–Riencourt-lez-Bapaume. Two companies of the tanks were engaged, the bulk with the IV. Army, the rest with the Reserve Army. The general idea of their tactics was that they should start so as to reach their objectives five minutes before the infantry. They were to act in small detachments of two or three machines against the strong points in the enemy's defensive system, lanes being left for their advance in the artillery barrage commencing at zero hour.

The tanks advanced at dawn in a slight mist and came as a complete surprise to the enemy. The operations of those with the XV. Corps of the IV. Army were the most successful; but for various reasons the results of the employment of tanks was somewhat disappointing. Of the 49 machines taking part 32 alone reached their starting points, 9 pushed ahead with the infantry and caused considerable loss to the enemy and 9 others, which did not catch up the infantry, did good work in dispersing of the enemy still holding out at isolated spots; of the balance of 14, 9 broke down and 5 became "ditched." (Ditching was usually caused either by a tank getting into such a position in a deep and wide crater or trench that its engine power was not sufficient to pull it out, though the tracks gripped, or by weight of the machine being taken by its belly on hard ground, in which case the tracks revolved without biting.) One tank gave remarkable help to the infantry held up in front of Flers by wire and machine-gun fire, when by its action it caused the surrender of 300 Germans and enabled the infantry to move on. Another destroyed a field gun. On Sept. 25 and 26, 13 machines acted with the IV. and Reserve Armies. Of these nine were ditched in shell craters, two reached the village of Thiepval and stuck there. But again, as a set-off to mishaps, one single tank on the 26th performed a remarkable feat which demonstrated the potentialities of the machine. Within one hour, and at the expense of five British casualties, it made possible the capture of a strongly held, well wired, trench (the Gird trench) some 1,500 yd. long and strengthened by numerous strong points, which had held up a whole brigade of infantry since the previous evening. The Germans suffered heavy loss, and 8 officers and 362, other ranks, surrendered. On Nov. 13, at the battle of the Ancre after heavy rain, of five tanks that went into action, all became ditched, two machines doing very valuable work before this happened. Next day, in an attack on a field work south of Beaumont Hamel, one machine out of three employed was put out of action by shell fire, and two became ditched. The latter, however, were able to bring so effective a fire on the strong point that it surrendered and 400 prisoners were collected by the tank crews. But, whatever their defects, the tanks had passed with ease through all entanglements and had destroyed many machine-guns, which weapons, indeed, were practically powerless against it.

The employment of the tanks in Sept. 1916 was contrary to the views of those who had originated the Arm, who were responsible for its production and had most studied its action. They held that the utmost value should be obtained from the new weapon and that the secret of its existence should not be given away until a surprise attack could be carried out on a sufficiently extensive scale to give a chance of achieving a decisive success. In this sense the launching of the tanks was a repetition of the error made by the Germans when they released gas on a small section alone on April 22 1915. Whatever may have been the urgency at that time of reviving the momentum of the Somme offensive, which had died away after weeks of great endeavour and immense sacrifice, and of raising the *moral* of the tired troops, and whatever might have been the success of the new weapon, it is doubtful if the small number actually employed could have given a result to compensate for the premature disclosure of the secret, which in potential value was equal to that of the 42-cm. howitzers and the poison-gas of the enemy. Again, not only was a small number of tanks used, but they were employed in driblets in different directions, instead of together in as great a mass as their available number would allow. As an experiment this trial of the tanks was, no doubt, productive of valuable lessons, but they were obtained at the cost of discounting the future. It was in the face of a considerable amount of scepticism that the machines took their place in the battle-line, and those who did not believe in them, without looking beyond the lack of any startling success achieved on a great scale, were not slow in their condemnation. But one thing the tank had definitely proved: *The machine-gun and the barbed wire entanglement no longer ruled the infantry battle.* In the tank, still experimental and imperfect as it was, they had found their master. At last attacking infantry could meet the defence on more than equal terms.

---

[1] This scheme was also abandoned and later found necessary.

On the part of the tanks themselves there was mechanical failure of machines, which were the first of their kind, tried under more difficult conditions than those which they had been designed to meet. The specification in which they had been constructed had been based on the requirements of the spring of 1915 at a time when the prolonged shelling, such as in 1916 and later rendered whole tracts almost impassable even by infantry, was undreamt of. At the Somme the tanks had to cross a dry "crumped" area, and at the Ancre a combination of "crumped" area and morass. There were, in addition, breakdowns due to faulty design and to the unexpected wear and tear of certain parts of the machinery, which only experience could have shown should have been of special material and which were, moreover, practically worn out by practice and demonstrations before the action. Failures were also due to the lack of time for the complete training and practice of the crews; to insufficient preparation in the way of reconnaissance and supply services, which for such complicated machines necessitated very complete organization. On the other hand, many of the commanders at whose disposal tanks were placed had no idea of their capabilities, weaknesses or limitations. Nevertheless, the outstanding brilliant exploits of single machines which did not break down, the great saving of life for which the tanks as a whole were responsible, and the demoralizing effect of their appearance on the enemy and the great encouragement afforded to the British infantry, clearly showed that the machines were sound in principle, only needing improvement in detail, and that those handling them required more experience in this new form of warfare.

As a result of its trial it was decided that the new Arm should not only continue, but should be expanded to a force of 1,000 tanks. After the fighting on the Ancre the unit did not again go into action till April of the following year, which allowed of a period for expansion, reorganization and training, and the incorporation of improvements to machines.[1] The expansion of the Heavy Branch of the Machine-Gun Corps was to be on the following lines: there was to be a fighting headquarters in France and an administrative headquarters in England.[2] The six original companies were to be expanded to four battalions in France and the two companies at home to five battalions, or nine battalions in all. The unit therefore reverted to its original battalion organization. It was eventually to comprise three brigades, each of three battalions, each battalion of three companies and a workshop, each company consisting of four fighting sections of five tanks each and a headquarters section of four tanks, or 72 tanks to a battalion. The number of tanks per section was shortly afterwards reduced to four, making 20 per company or 60 per battalion. These brigades were formed at the beginning of 1917, and the organization continued unchanged until June, but though the *personnel* was being raised and trained as far as possible on this extended scale, the supply of tanks did not keep pace, so much so that on April 1, when it was decided that the tanks should take part in the battle of Arras, only 60 Mark I. and Mark II. machines could be counted on for action.

In Feb. 1916, when the original Mark I. tank was still in its experimental stage, designs had been got out for a Mark II. machine and a Mark III. machine, both of which were slightly improved Mark I. tanks. After the Somme battle certain modifications which were found necessary were incorporated, and in Oct., in order to keep up continuity of supply, orders were given for 50 machines of each type (making 250 tanks ordered in all) pending the decision on the design for the 1,000 asked for by the army, in Sept. The chief improvements consisted of the abandonment of the tail, as already mentioned; the addition of "spuds," or fins, to the track plates, to give a better grip; and the provision of improved rollers. The Mark III. machines were also intended to have thicker armour to resist the "K" bullet. In regard to the 1,000 new tanks preliminary orders to collect material were given to the manufacturers in Sept. At the end of the month when it was learnt that these machines could not be ready by March 1 (partly owing to the manufacture of spare parts necessary for the existing tanks), the demand was cancelled, but was renewed two weeks later. This is mentioned to show that military opinion as to the advisability of proceeding with the new weapon was not unanimously favourable. The 1,000 machines were to be of the type known as the Mark IV., which was a much improved Mark I. tank. It was then anticipated that this number could be delivered by the end of June. Owing to various difficulties this estimate was not fulfilled, but sufficient machines reached France in time to equip two battalions for the attack on Messines in May; and it was the standard British tank during 1917 and 1918.

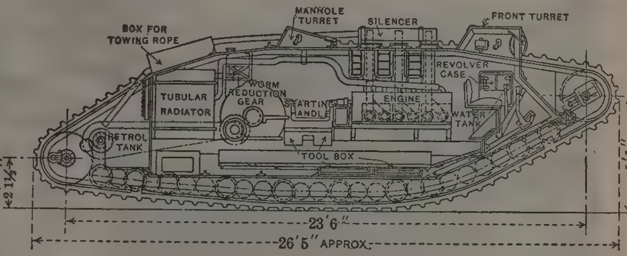

FIG. 3.—Mark IV. Tank.

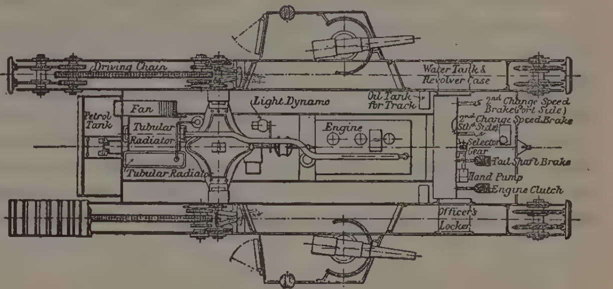

FIG. 4.—Mark IV. Tank.

The Mark IV. tank (see figs. 3 and 4).—The first advance from the original weapon was the same in size and general design, with certain improvements. There was no tail. The track rollers were better. The sponsons could be housed within the tank for rail transport. The Lewis machine-gun was installed instead of the Hotchkiss machine-gun (this was not an improvement and was reversed later). A better radiator was fitted and also a silencer. The width of the driver's cab was increased to allow of wider track shoes. The petrol tanks were placed outside the tank at the stern. A short 6-pdr. gun was adopted. Detachable spuds were fitted to the tracks, and unditching gear provided. The entrances and exits were more accessible.

During the Verdun offensive early in 1916 it had occurred to those responsible for the production of the fighting tank that one reason why the Germans had been unable to keep up the initial pressure of their attack was their inability to bring up their artillery and ammunition over the shelled and entrenched area so as to keep pace with their advance; and that if they had been in possession of guns mounted on self-propelled carriages, or carriers on caterpillar tracks, it would have assisted them greatly. A design was therefore prepared in July of a "gun-carrying" tank (see fig. 5), to carry a 60-pdr. gun or 6-in. howitzer which could be fired from the tank if necessary or conveyed by the tank and fired from the ground. Of these machines,

---

[1] The most important improvement was the improvised "unditching beam" which was introduced to assist a tank to extricate itself when stuck. In the later types a specially designed contrivance was part of the equipment of the machine.

[2] Lt.-Col. (afterwards Maj.-Gen.) H. J. Elles, R.E., was appointed colonel commanding the unit in France, Brig.-Gen. F. Gore Anley being appointed administrative commander of the tank training centre in England on Nov. 9. In May 1917 Brig.-Gen. Anley was succeeded by Maj.-Gen. Sir J. E. Capper. The training centre was moved to Bovington in Dorset.

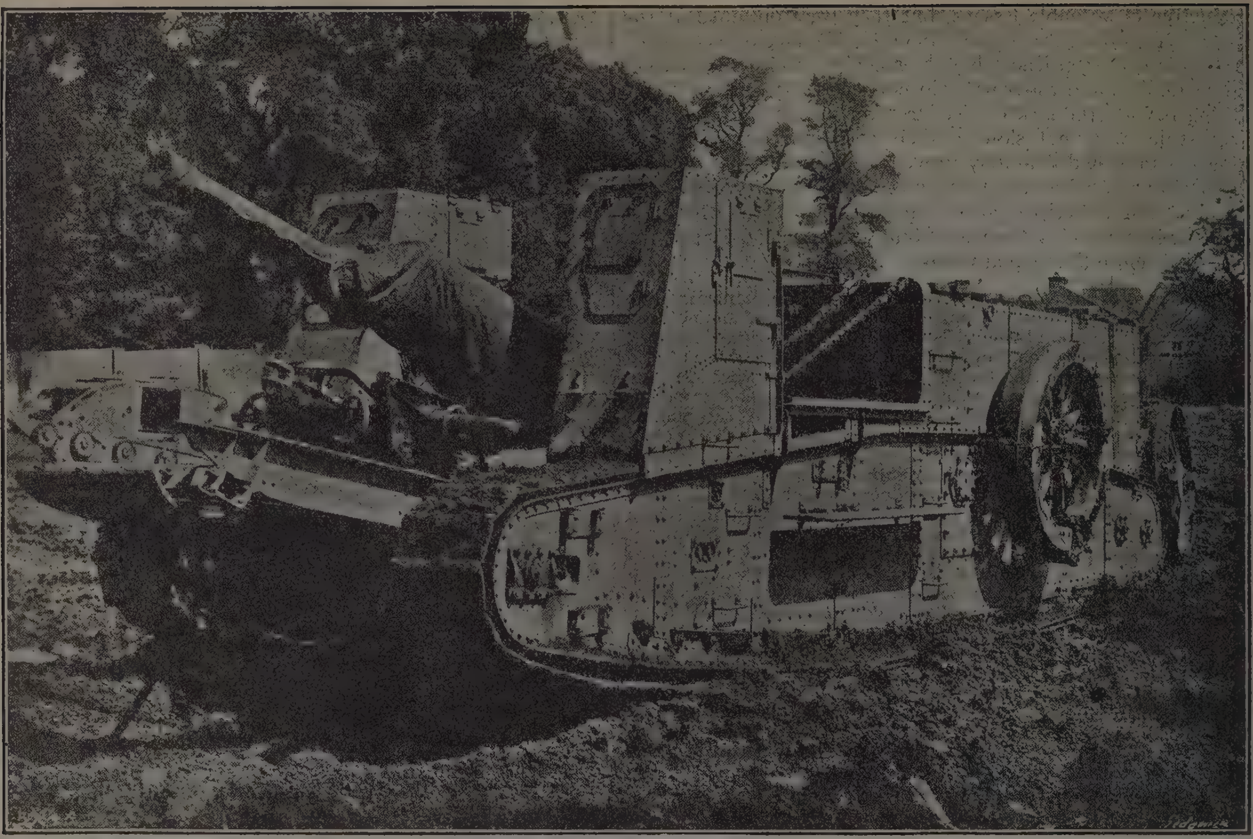

FIG. 5.—Gun-carrying Tank.

48 were made, delivery in France commencing in July 1917. They appear to have been employed as much for the conveyance of ammunition and stores as for the purpose for which they were designed. In Dec. 1916, also, the design of the "Whippet," the Medium Mark A. tank, (see figs. 6 and 7) was commenced. Of this type 200 machines were produced, delivery in France starting at the end of 1917. It was evolved to be complementary to the heavy tanks and to meet the demand for a speedier, handier machine which could be produced in large numbers. Its main points were its increased speed, nominally 8 m. per hour on the flat, and an average across-country of 5 m. per hour, and its lightness, one-half that of the Mark I. machine. It was also easier to transport by rail. Each track was driven independently by a four-cylinder 45 H.P. Tylor engine. Transmission was by cone clutches to gear boxes of the constant mesh type, giving four speeds forward and one reverse. The design was largely due to Sir W. Tritton. Thus, at the end of 1916, in addition to the first type of heavy tank in the field, measures were in hand to supply a much improved pattern of that machine (Mark IV.) and also a lighter type—the "Whippet."

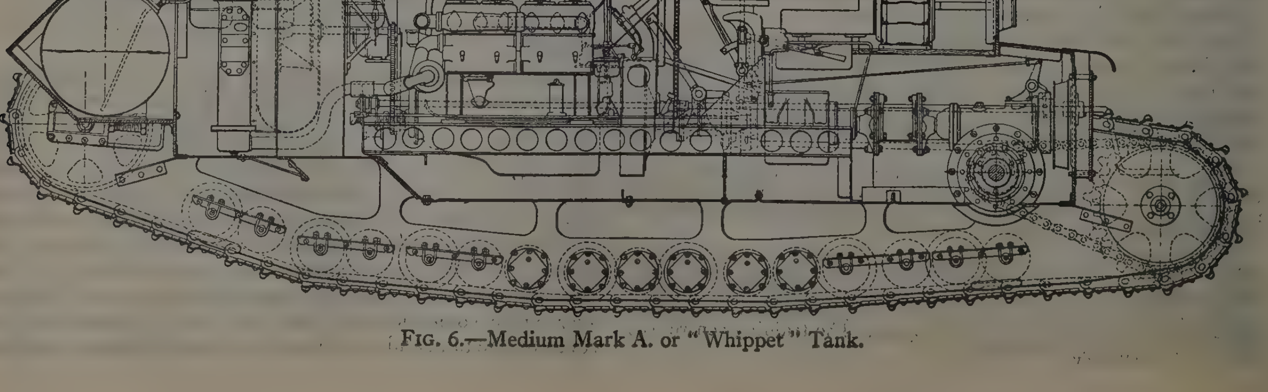

FIG. 6.—Medium Mark A. or "Whippet" Tank.

In the field, though there was still considerable doubt as to the value of tanks, the next six months, from Oct. 1916, were, as had been said, a period of expansion, organization and training, and preparation for the operations of 1917. The training was always handicapped by the paucity of machines; and it was found necessary not only to educate the members of the new arm itself but also other arms and the staff. Headquarters, schools and rest camps and the usual organization of a large unit were established. The next action in which the tanks took part was the battle of Arras on April 9, when an attack was carried out by the I., III. and V. Armies in order to penetrate the German line by a sudden blow and allow of an army corps and two divisions of cavalry to break through. From the point of view of tanks it does not require much comment. Only 60 machines were available, and they were again not employed in a mass for a quick penetration but for "mopping up" operations along the whole front.[1] More complete preparations were made for their coöperation than at the Somme. The battle was prepared by a prolonged bombardment, and was also preceded by heavy rain at the last moment, which combined to produce a sea of mud pitted with craters. The Vimy Ridge was captured by a rush of the Canadians which rendered tanks unnecessary, and on other parts of the front they had varying success, but gave valuable assistance. Against Bullecourt on the 11th, where they attacked without artillery preparation in the snow, the attack was a failure, though two tanks penetrated five miles behind the German front line, when they were captured. Fighting continued till the 22nd. The cavalry were prevented from breaking through by the usual obstacles—barbed wire and machine-guns. It was on the first day of the fight that the first German "tank trap" was discovered consisting of a deep covered-in pit. Again the main lesson learned was that tanks should be used in mass and not dispersed. After this battle an expansion of the Heavy Branch, Machine-Gun Corps, from 9 to 18 battalions (nine of heavy tanks and nine of medium machines) was decided on. But at the end of June this expansion was suspended owing to shortage of man-power, as it was apparently not yet realized to what extent the tanks reduced casualties. Before the next action, the battle of Messines, a certain number of the new Mark IV. tanks had been received and several of the old Mark I. and Mark II. machines had been converted into supply tanks for carrying tank stores to the fighting machines, a very great advantage the want of which had previously been much felt. In the attack on the Messines–Wytschaete Ridge, which started on June 7, 76 Mark IV. and 12 supply tanks took part. The operations in this case approximated to the "assault" in the old form of siege warfare and depended mostly on an intense bombardment, lasting from May 28 to June 7, and the explosion of 20 large mines. During the infantry advance on Wytschaete the creeping barrage proved so effective that tanks were only necessary at different spots to overcome individual machine-guns. They advanced in two lines, the first of 40 machines, going forward at zero (dawn), and the second, of 34 machines, at 3 P.M. to the Oosttaverne line, where their help was very valuable. Apart from the debated point whether the third battle of Ypres should ever have been fought or not, the work of the tanks in it needs still less comment than at Arras or Messines. In spite of remarkable feats accomplished by them, especially the capture of the Cockcroft, a nest of strong points, on Aug. 19 with a loss of 15 infantry, it was, on the whole so far as they were concerned, a failure, and a failure which was inevitable and to be expected under the conditions which existed. They had to act in a low-lying area which had been converted into a potential swamp through the destruction of the drainage system by the artillery of both sides, rendered still worse by the churning up of the surface into a wilderness of craters, which were filled by heavy rain just before the battle. The only means of approach across this morass were the causeways, which were naturally kept continuously under fire by the enemy. Preceded by many days of intense bombardment the attack commenced on July 31, and as it continued the rain made matters worse. That tanks should have been expected to function under such conditions, when, independently of the enemy's action, even the infantry were unable to move forward, is astonishing. It shows that those responsible for the decision to employ them were ignorant either of the situation or the limitations of the machines, or both.

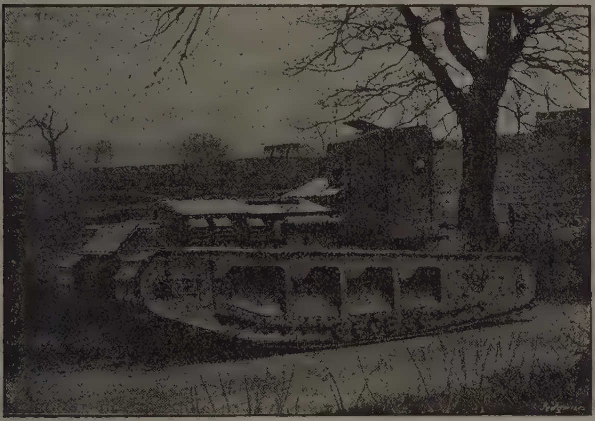

FIG. 7.—Medium Mark A. or "Whippet" Tank.

It was not till Nov. 20, when the tanks had been in France over a year, that they were given an opportunity of showing of what they were capable when employed on a large scale, in a manner calculated to exploit their peculiar attributes, and under favourable conditions. As this was a turning-point in the history of the new weapon it is of importance that it be described in detail.

During 1916 and the greater part of 1917 the tanks had been thrown into the fight in dispersed detachments to assist in overcoming certain points of resistance, and somewhat casually as an aid to the attacking infantry. The conditions, also, had usually been such as to render success doubtful, sometimes impossible, and in any case of a minor nature. In several instances they had succeeded in achieving their immediate object and had undoubtedly saved many lives. In others they had failed. As a consequence it was seriously discussed whether tanks should not be abandoned as useless.

But those responsible for the Tank Corps (the name of the unit had been changed to "Tank Corps" at the end of June) had been concerned in thinking out an operation which would not only be strategically valuable, but would enable the corps definitely to prove its worth and establish a confidence in itself, which, never very marked on the part of General Headquarters, had recently been much shaken. Broadly, the scheme consisted in launching without any preliminary bombardment a surprise attack on a large scale with as many tanks as possible over ground suitable for their action, *i.e.* reasonably hard soil which had not been shelled to pieces. The area chosen was that near Cambrai, in the re-entrant of the Canal d'Escaut between Ribécourt, Crèvecoeur, and Banteux, which consisted of almost unshelled rolling downs of chalk. The attack was originally intended to be of the nature of a "raid" (this was not adhered to in its execution) carried out by an advance at dawn of three lines of tanks, the first of which would make straight for the enemy's guns, previously bombed from the air, to be followed up by the second and third; artillery coöperation to be confined to counter-battery work and the destruction of communications and depots, etc., behind the German front line. The essential points of the plan were surprise and speed. The project was put forward and approved, and the result was the battle of Cambrai, which took place on Nov. 20.[2]

---

[1] "Mopping up" consisted of disposing of small bodies of the enemy, especially such as had escaped the bombardment and allowed the first line of the assault to pass them.

[2] The action as fought was in almost every detail the execution of the plan put forward officially for the employment of the tanks by Col. Swinton in Feb. 1916, 22 months previously.

Further details of the plan were that the artillery barrage of shrapnel and H.E. shell should open on the enemy's outpost at zero hour (6:20 A.M.) and be advanced by stages of 250 yd. just ahead of the tanks and concentrated on special points. The tanks were to go forward at zero hour in sections of three machines, sections being allotted to different objectives according to the strength of the latter. Each section was composed of one vanguard tank and two main body tanks. The former was to lead and protect the advance of the two other machines, behind which followed the infantry in parties of varying size, marching in sections in single file. As the Hindenburg trenches, some 12 ft. wide, would have to be crossed each tank was to carry a specially made fascine 10 ft. long and 4½ ft. in diameter to drop into the trenches to assist in the crossing. Special machines were fitted with drag grapnels in order to drag aside the wire entanglements which were known to be exceptionally thick and strong, for the passage of the cavalry. Great precautions were taken to maintain secrecy, upon which so much depended, and extremely careful preparations were made in the way of reconnaissance, the training of the infantry to act with the tanks, the movement of machines, and the formation of dumps of the necessary stores. For instance the preliminary movement of the tanks necessitated 36 special trains, and the material collected in dumps included 165,000 gal. of petrol, 55,000 lb. of grease, 5,000,000 rounds of S.A.A. and 54,000 of 6-pdr. ammunition. Three brigades (nine battalions) of tanks took part in the attack, with two army corps of three divisions of the III. Army, a cavalry corps and 1,000 guns. In all there were 378 (Mark IV.) fighting tanks and 98 administrative machines.

Fog on the morning of Nov. 20 assisted the attack, which was carried out as arranged, the tanks following the barrage and the infantry the tanks. The operation was an amazing success and came as an absolute surprise to the enemy, most of whose infantry were panic stricken and bolted or surrendered, the garrisons of certain strong points alone offering a determined resistance. Assisted by the tanks, the infantry by evening had occupied Marcoing,[1] Bois des Neuf, Premy Chapel, Havrincourt, Graincourt, Aneux, Noyelles. Next day, and on the 23rd, 25th and 27th, further progress was made, but the tank units which had been fighting continuously were disorganized and the crews physically exhausted; and the mistake had been made of not keeping a small proportion of tanks in reserve. On the 27th the impetus of the attack died out with practically no more ground gained than had been won on the first day, where the tanks, starting from a base of 13,000 yd. length, had in 12 hr., and at a cost of some 4,000 casualties, enabled the enemy's zone to be penetrated to a depth of 12,000 yd. (at the third battle of Ypres an equal extent of penetration had taken three months), and 8,000 prisoners and 100 guns to be captured. And their action had obviated the necessity for a preliminary bombardment (which would have cut up the ground and rendered any rapid advance of infantry impossible, and brought a concentration of enemy's reserves), and also the usual wire cutting artillery fire, which together would have cost many millions of pounds. (An estimate places the cost of the preliminary bombardment at the third battle of Ypres at approximately £22,000,000. A similar bombardment at Cambrai would possibly have cost more, as the German wire was on the reverse slopes of the rising ground.)

In numbers the *personnel* of the tank corps employed in the fight amounted to a little over 4,000 of all ranks, or the strength of strong infantry brigade. The fact that there were no larger bodies of infantry ready to reinforce the tired troops and press the advantage gained, and that the cavalry did not break through to Cambrai as was intended, was not owing to any failure on the part of the tanks, which achieved more than had been promised. The absence of any large force to take advantage of the opening made by them tends to show that it was not believed that they could do what they actually did accomplish, and that their complete and extraordinarily speedy success was as much of a surprise to British Headquarters as it was to the Germans. For nearly three years efforts had been made by both sides to force a way through the enemy's position quickly. At Cambrai a door was suddenly flung open and there was no force to press through. The success achieved by the surprise counter-attack by the Germans on the 30th also had nothing to do with the previous action of the tanks, but its effect was to discount the whole British victory including their performance. Against the southern portion of this German counter-attack a brigade of tanks which were hurriedly collected proved their worth in a defensive rôle, and gave invaluable assistance in stopping the onrush of the enemy.

The success of the tanks at Cambrai on Nov. 20, and all that it implied, gave as much food for thought as had the first use of gas by the Germans in 1915, unattended, however, by the horror of the means employed on the first occasion when a surprise penetration was effected by either side. It has been described as the "Valmy of a new epoch in War, the epoch of the mechanical engineer."[2] But it is doubtful if the truth of this statement has been fully appreciated even three years after the war. Even so, the effect of this action on the Allies, and also on the Germans, was immediate and far-reaching. It almost established the fact, for which the protagonists of the tank had been endeavouring to gain acceptance for many months, that the new Arm, used properly, was a serious factor in warfare which could not be put aside and ignored. And yet, though opinion in regard to the tanks had changed, even at that period when the immense losses suffered in the attempted offensives of the previous eighteen months had rendered the problem of man-power so acute, the crucial point was still not realized that an actual saving in life and economy in man-power would be gained by the development and whole-hearted employment on a very large scale of the mechanical Arm. And steps were not at once taken for a great expansion. The increase of the Tank Corps previously deferred was agreed to; but a proposed further expansion, based directly on the experiences of Cambrai, was not approved. And later, in April 1918, even the agreed increased establishment was again temporarily suspended after the German offensive in order to meet the demands for infantry reinforcements, and was not completed until after the striking successes gained by the tanks in July and Aug. 1918.

After Cambrai all ideas of attempting to prosecute the offensive were abandoned, and there ensued a period of preparation for resistance against the attack which was expected as the result of the reinforcement of the German strength on the west, rendered possible by the defection of Russia. To assist in meeting this, the Tank Corps, now of five brigades, or thirteen battalions, with 320 Mark IV. and 50 Medium A machines fit for action, was in Feb. 1918 distributed in detachments over some 60 m. of front.

During the second battle of the Somme, from March 21 to the end of the month, the part played by it was to coöperate in various local counter-attacks, its action being generally useful in assisting to delay the enemy's advance, as the German infantry would not as a rule face tanks until their guns were brought up. But out of the total, some 170 machines alone went into action usually and inevitably in hasty, improvised operations carried out during the general retrograde movement. Many machines were lost and their crews employed on foot as Lewis Gun sections. It was during this period that the new "Whippet" machines made their début with great effect. Generally speaking, the tanks were too scattered for full value to be obtained from their action. The corps also took its share in repelling the second German thrust against the British, which started in the Lys area on April 9, during which three battalions fought, some of the *personnel* of the lost tanks fighting on foot as a Lewis Gun brigade. It was in this quarter, near Villers Bretonneux, that the first duel between tanks—possibly a presage of future warfare—took place.

The lack of decisive results obtained by the small detachments of tanks acting in improvised counter-attacks in the general defensive seems to have revived the lingering prejudices of those who were hostile to the arm, and who maintained that the mass action of Cambrai could never be repeated. However, in spite of this, progress was made in May and June in preparing for the future offensive, the chief point of note being that the new Mark V. (heavy) tanks, which were a great improvement on previous models, being much handier and also more mobile, were arriving at the rate of 60 machines per week. On July 4 occurred the action which probably finally dispelled the doubts of the most conservative and reactionary. This was the surprise attack of Hamel, a deliberate offensive and not a defensive counter-attack, in which recently received Mark V. machines coöperated with the Australians. This fight was an example of a perfectly organized action and of the advantage of previous careful training to act together of tanks and infantry, and was a speedy and complete success, achieved at the low cost of some 700 casualties. One feature was the special power possessed by the new and speedier tank of destroying machine-guns, many of which were rolled over and crushed.

The logic of facts was irresistible, and after this action the coöperation of the tanks was thenceforward accepted, not only as a useful adjunct but as an absolute necessity, for all offensive operations. On July 17, at the battle of Moreuil, one battalion of tanks coöperated with three French divisions in a most successful attack on a similar plan launched after one hour's preliminary bombardment.

---

[1] The information of the capture of this village was sent back by a wireless signal tank, and was received at Albert 10 min. after the troops entered Marcoing.

[2] *Tanks in the Great War*, Col. J. F. C. Fuller, p. 153.

July 18, the date of the great French victory of Soissons, marked the turning point of the war. It depended on tanks, and was rendered possible by their proper employment in mass and as a surprise. In fact, as the recent British offensive on a smaller scale had been, it was based on the battle of Cambrai. It was followed by a similar operation, the battle of Amiens on Aug. 8 which opened the British strategic offensive.

This battle was also based on the power of the tank arm, and was designed and organized to derive the utmost value from it and to give it every chance to perform its proper, logical function in a general operation. The tactics to be employed by the tanks were an elaboration of those employed at Cambrai modified by recent experience and adapted to the improved machines available. The attack was carried out by three army corps, with three divisions in reserve, a cavalry corps and 11 tank battalions. In regard to the tank battalions they were now better equipped than they had been. Nine were equipped with the new Mark V. machines (36 each), and two with the "Whippets" (48 each), or in all 420 fighting machines. There were also 42 tanks in reserve, 36 supply tanks, and 22 gun-carriers, or 580 machines in all. The "Whippet" tanks were to act with the cavalry. There was no artillery bombardment, and the tanks advanced with the barrage at "zero" hour. The heavy guns were used for counter-battery work and the field artillery moved forward in close support of the infantry. Noise barrages (made by low lying aeroplanes) were used to drown the sound of the tanks' approach. On the first day the maximum advance of the tanks was 7½ m., and they continued in action for four days till the 11th.

The battle of Amiens was a tremendous blow, both material and moral, to the Germans, who, besides casualties, lost 22,000 prisoners and 400 guns; and the victory was admittedly very largely due to the tanks. Amongst other lessons learned it was again found that these machines, like other arms, required a reserve to keep up the pressure after the first day of action, and that the limit of endurance of the heavy machines before overhaul was three days; that they were suited for trench warfare, the medium machines for open warfare; that the heavy supply tanks should be replaced by a light cross-country tractor; that wireless and aeroplane communication, as then developed, was not so certain as that by galloper; that it was a mistake to tie up tanks to cavalry, for, during the approach they could not keep up, and during the fight were kept back by the cavalry, which under hostile machine gun-fire had to retire or move to a flank until the tanks disposed of the machine-guns; and that machines of greater speed and greater radius of action were necessary. According to one authority,[1] if machines capable of moving at 10 m. an hour with an endurance of some 100 m. had been available, the German forces south of the Amiens–Roye–Noyon road might have been cut off and the end of the war greatly accelerated.

July 18 and Aug. 8 were not only victories for the French and British over the Germans, they were victories over their opponents for the tank arm in each army. In regard to the British it is sufficient to say that up to Nov. 5, their last fight, no attack took place without tanks. They coöperated in every offensive including such important operations as the battle of Bapaume, and the second battle of Arras, the battles of Epehy, Cambrai-St. Quentin (when the Hindenburg line was broken), the Selle and Maubeuge. Latterly, indeed, during the "war of movement" which set in after the Hindenburg line had been passed, advancing infantry when faced by the German rear-guard machine-gun posts almost invariably halted for tanks to come up and dispose of them before they moved forward.

So far as statistics can show what a part they played, the following facts speak for themselves: By the time of the battle of Amiens much of the *personnel* of the Tank Corps had been in action 15 or 16 times, and during the 95 days from that time to the Armistice tanks (to the number of 1,993) were engaged in fighting on 39 days. The casualties, killed, wounded and missing were 598 officers and 2,826 other ranks. These, though heavy in relation to the strength of the unit, which was under that of an infantry division, were not heavy for 39 days hard fighting if it be borne in mind that in pre-tank days it was not unusual for an attacking division to suffer 4,000 casualties in one day often without reaching the objective.

The final despatch of the Commander-in-Chief of the British armies contained the following words:—". . . Since the opening of our offensive on August 8th, tanks have been employed on every battlefield, and the importance of the part played by them in breaking up the resistance of the German infantry can scarcely be exaggerated. The whole scheme of the attack of August 8 was dependent upon tanks, and ever since that date on numberless occasions the success of our infantry has been powerfully assisted by their timely arrival. . . ." It would not be too much to say, that in spite of any artillery assistance, the series of overwhelming, immediate and economical (both in life and treasure) victories won at Amiens and afterwards would have been absolutely impossible without tanks, as would the whole scheme of the strategic offensive which depended for its execution and cohesion on the prompt and certain success of these attacks. And this statement, which is tantamount to an expression of opinion that human bodies cannot vie with armoured machines against wire and machine-guns, is no disparagement of the British infantry. It is one which would be borne out by the survivors of Neuve Chapelle, Loos and the Somme.

After the action of the Somme a few tanks were at the end of 1916 despatched to coöperate against the Turks in Palestine, where the situation was somewhat similar to that which had arisen on the western front. It was doubtful, at first, whether the machines, some parts of which wore out very quickly, would operate in the sandy desert; but it was found that the dry sand was less harmful than the mud of Flanders, and the tanks in fact stood the test well, and covered a surprising number of miles, though they happened to be machines already partly worn out in training. Only eight tanks were sent out, which was far too small a number to enable any very important result to be obtained in a field where the bold use of tanks in force might have had a decisive effect. The terrain favoured their action, and the strength of the defence, doubtless owing to German influence, lay largely in machine-guns. Their entry into action was not a surprise, for the enemy were aware of their arrival in the country; and they were used on two occasions only, at the second and third battles of Gaza, on April 17 and Nov. 1 1917, all the machines taking part.

Though the tasks set before them at both battles would have been more suitable to a force of machines five times their number, they rendered in each case great assistance and saved much loss of life. As a result of their help, which was greatly appreciated by the infantry, who were, of course, chiefly affected, an effort was made early in 1918 to obtain a number of "Whippet" machines for action against the Turkish rear-guard during the further advance. But this demand synchronized with the German offensive on March 21, and no machines could be spared for a theatre peculiarly suited to them.

So far an outline has been given of the main tank operations, and the development and expansion of the unit. The former showed a gradual increase of the scale on which recourse was had to the machines, and an elaboration in the preparations made and the tactics applied. From the 49 fighting tanks which were allotted to the attack at Cambrai, the number rose to 580 of all types at Amiens nearly two years later, the latter being the greatest British tank action fought. And, according to the preparations which were being made at the time of the Armistice, any great offensive in 1919 would have been conducted with thousands of British tanks alone, leaving out of consideration the equally large numbers of French and German machines that would have been engaged.

By Aug. and Sept. 1918 the type of heavy fighting machine had been improved in design, reliability and speed, and a faster medium tank had been introduced. Measures had also been taken to equip, for cross country work, all the battle services for the tanks. There were fighting tanks; supply tanks, to carry up ammunition, drinking water and stores; gun-carrier tanks, used for the same purpose, as well as for conveying artillery and trench mortars, both sometimes dragging sledges similarly loaded; wireless signal tanks; salvage tanks; all working on a coördinated system toward the maintenance or pressure on the enemy with the maximum of efficiency. And to assist in doing this there was a complete repair organization, the central workshops, with its advanced stores and salvage companies. For a major operation, the system of attacking with a small number of machines divided up into separate detachments had been abandoned and the proper tactics of mass attack in as large force as possible in definite formations to meet different conditions, with reserves to keep up the advance, had been adopted. Signal units had been formed. The elementary system of signalling with flags and with daylight lamps to aeroplanes had been elaborated, pigeons were used, and wireless signalling had been reintroduced, and wireless telephony with aeroplanes had been tried, but not with much success. Intimate coöperation with low-flying aeroplanes had been organized, especially in the direction of noise barrages, machine-gunning and bombing the enemy, chiefly of the hostile guns, and dropping information, as also observation for counter-battery work, and smoke-screens were employed. In short the battle was organized to include and harmonize with the new instrument.

---

[1] *Tanks in the Great War*, Col. J. F. C. Fuller.

In regard to the future of the tanks, had the war not ended in 1918, certain proposals for expansion for the 1919 campaign, made at the Inter-Allied Tank Committee in Jan. 1918, were again brought up in July, and new establishments for the increase of the Tank Corps to a strength of 34 battalions were sanctioned in Oct. This strength, together with the number of some 6,000 machines which it was hoped to produce for 1919, is in itself evidence of the importance attached to the tank arm at the close of the war. Its strength in the field in Oct. 1918 amounted to 12,355 of all ranks, whilst many thousands more were under training at home.

The work of designing and producing the different types of machines which took the field, or were almost ready to do so, necessitated a very large organization. In addition to the Medium Mark A. (Whippet) machines, of which, as has been stated, delivery began in France at the end of 1917, the following types were evolved.

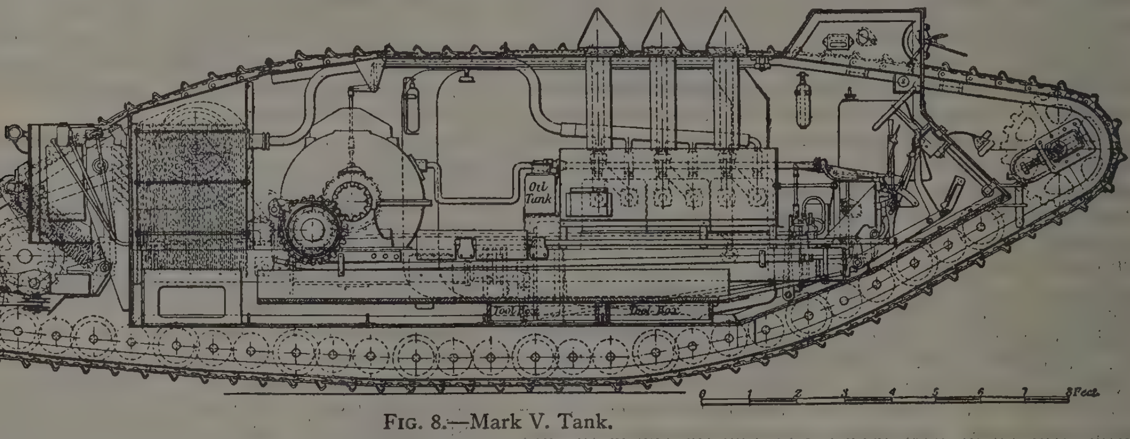

Fig. 8.—Mark V. Tank.

The Mark V. tank (see fig. 8 and table A). This was in design and size the same as Mark IV., but it was superior to it in the following particulars:—The engine, a 6-cylinder Ricardo engine of 150 H.P., was more powerful and was expressly designed for the tank. The manœuvring powers were improved by one-man control and an epicyclic gear. The means of observation were improved. The unditching gear could be worked from inside the machine. Better means of clearing the tracks of mud were provided. The design for this was begun in Oct. 1917 after the experiences of Messines and the third battle of Ypres, and was to meet the requirements as then known. Some of these machines reached France in time for the attack on Hamel on July 4 1918, and this tank was the principal machine of all the subsequent fighting. In all, 403 were made.

The Mark V. Star tank was the same as a Mark V. machine, with 6 ft. added to the middle of its length. It could cross wider trenches (14 ft.) than the Mark V. machine, and could carry about 20 men in addition to the crew. The design was not started till Feb. 1918, 32 machines being made, of which some were delivered in time for the battle of Amiens. The tank was too long to be very handy.

The Mark V. Two-Star tank was the same as the Mark V. Star, but with a 225-H.P. Ricardo engine. Design was started in May 1918, one being made but not delivered before the Armistice.

The Mark VI. tank was intended to be the same size as the Mark IV. with an improved transmission (the Williams-Janny variable speed gear), but did not get beyond the design stage.

The Mark VII. tank. This was 3 ft. 6 in. longer than the Mark IV. and Mark V. It had a 150-H.P. Ricardo engine and a variable speed gear. Seven were made, but none was used in the field.

The Mark VIII. tank. The design for this machine was commenced in Dec. 1917; seven machines were made, but none was employed in the field. It was larger (34 ft. 2½ in.) than any other tank, and was designed so as to be made up of parts manufactured in England and the United States, and was to be engined either with the American 300-H.P. Liberty, or the British 300-H.P. Rolls-Royce, engine. The engine-room was separated from the fighting-chamber by a bulkhead and the ventilation was improved.

The Mark IX. tank (Infantry tank). The design for this was begun in Sept. 1917. Thirty-five machines were made, but none was actually used. It was a long machine with space in the centre to carry 50 infantry or 10 tons of stores.

The Medium B (Whippet) tank. The design of this, which differed from that of the Medium A, was commenced in June 1917. The shape was more like that of the heavy tanks. It had a four-cylinder 150-H.P. Ricardo engine. Forty-five machines were made, but none used. In all, 2,636 British tanks were constructed.

The production of the tanks on the first order for 150, which were in action in 1916, six months after the order had been placed, was, as has been said, a remarkable achievement. After that time supply was carried out by the Mechanical Warfare Supply Department of the Ministry of Munitions, working in conjunction with the War Office and G.H.Q. in France. The subject was handled by a succession of committees, composed of those concerned, which endeavoured to obtain coöperation and the allocation of responsibility as between the army, which demanded machines and changes of design, etc., and those who had to meet these demands. In Aug. 1918, control was taken over by a Tank Board, to coördinate all sides of the question of supply. There were naturally considerable difficulties in administration of the production side of this weapon improvised during hostilities, at a time when the manufacturing resources of the country were already deeply committed in satisfying the urgent demand for munitions of other kinds. The lack of continuity in the demands, also, which fluctuated as the value of the tank varied in the opinion of the army in the field according to its success in action, made continuity of work and accurate forecasts of output almost impossible. There were also questions of obtaining the necessary labour, manufacturing facilities, raw materials, and that of priority amongst so many competing requirements for carrying on the war. The problem was complicated by the multiplicity of special component parts and fittings required, the great wastage of machines from action in the field, and the quite unexpected wastage by wear and tear of certain parts, some of which, as the design of the machines developed, became obsolete before they could be used; and there were the technical difficulties of ensuring efficiency in details, of which the only test could be use in the field.

A great expansion in the sources of supply became necessary as the programmes of construction increased in size, and many engineering firms were engaged in the manufacture of the tanks in addition to the comparatively small number concerned in 1916 and 1917. Before the Armistice the supply of tanks was considered so important that men were relieved from the army to carry on production. The programme for 1919, including Inter-Allied production, which covered over 6,000 machines, required 193,000 tons of steel, 10,000 6-pdr. guns and 30,000 machine-guns, and an expenditure of £80,000,000. By the end of the war, tanks were accepted as being the best and most economical means of arriving at a decision in the field, as the ratio of results obtained to material and man-power absorbed was greater than from any other means. In England development in design has since continued in the direction of the evolution of tanks possessing greater speed and a greater radius of action than that of the more or less embryonic machines which were evolved during the war, and also in the production of machines which can function either on land or on water. Success in these directions will endow the machine, originally improvised with the limited object of assisting the infantry to break through an entrenched line, with far greater powers.

French Tanks

It is not remarkable that allies fighting a common enemy, side by side in the same theatre of war and subjected to similar conditions, should have evolved a similar means of meeting them. And it would have been natural had they done this simultaneously, in a common effort, or at least with mutual knowledge from the beginning on the part of each of what the other was doing. Curiously enough, this was not the case with the British and French, the two nations concerned in the creation of the tank. Forced into being by the same causes, a remedy for the same disease, even suggested in form by the same mechanical prototype, the British tank and the French *Char d'Assaut* were conceived separately, and for many months developed on independent lines, the British ignorant of French intentions and the French ignorant of what the British were doing. In the case of the latter, as of the former, it was the difficulty experienced in carrying out the pre-war theories of infantry attack against a prepared defensive which finally led to the new machine, though the effect of the H.E. shell of the French field gun may have prevented its necessity being felt so soon.

The French owed their tank[1] to the foresight and pertinacity of Col. (later Gen.) J. B. E. Estienne of the artillery, who, during the retreat of 1914, perceived the desirability for having some means of transporting infantry under cover across obstacles and swamps and ploughed land. Later, during the summer of 1915, on seeing the caterpillar gun tractors in use in the field by the British, his ideas took a more concrete shape in the direction of a *cuirassé terrestre* (land battleship). This was to be a caterpillar-propelled machine 4 metres long, 2·60 metres broad, 1·60 metres high, weighing nearly 12 tons. It was to be provided with a petrol engine, to travel at a speed of 6 m. per hour on the flat, to be protected by armour up to 20 mm. in thickness, to carry an armament of two machine-guns and one light Q.F. gun for the attack of machine-guns behind shields, and to be capable of crossing trenches two metres wide and forcing its way through barbed wire. It was also to draw an armoured trailer carrying 20 men and equipment. This was worked out in greater detail, but was in essentials the same as the scheme put forward in England in Oct. 1914, except that as projected the *cuirassé* was to be somewhat of a hybrid between a tug to haul a transport filled with men and a fighting machine, and not purely a destroyer which would open out a way for men to advance on their feet. Actually, however, both types were developed as fighting machines. Both, also, were inspired by the Holt tractor, of the existence of which the British originator had knowledge before the war, and of which the French originator first became aware when he saw it at work behind the British lines. Before these machines were introduced by the British in the early part of 1915 for moving heavy artillery, tractors on the caterpillar system were practically unknown in France. Later some brought over from Tunis were employed with the army of the Vosges. After communicating with the commander-in-chief, Col. Estienne on Dec. 1 1915 put forward his ideas in an official letter with a request for an interview. This took place on Dec. 12, which date can be taken as marking the official conception of the French tank. After consultation between Gen. Joffre and Col. Estienne, and discussions between the latter and representatives of the Renault and Schneider works during Jan., the French Army H.Q. submitted to the Ministry of War a demand for 400 tanks. These were to be of the design prepared jointly by M. Brillé of the Schneider Creusot Works, and Col. Estienne. For the French, therefore, this was the commencement of the solution of the problem of mobile protection for the infantry.

In regard to the French tanks, the year 1916 can be taken as one of gestation. The year 1917 covered the birth and infancy of the medium (Schneider and St. Chamond) tanks; the first half of 1918 the adolescence and maturity of the medium machines and the birth of the light (Renault) tank; and the last half of 1918 the adolescence and maturity of the light machine. But the period of gestation before the birth of the new arm, *i.e.* the appearance in the field of the *Artillerie d'Assaut*, or "A.S.," was, as in the case of the British Tank Corps, somewhat lengthy. Its promoters still had much opposition and many obstacles to overcome, for the question of production was handled by more than one department or directorate, a state of things which is usually bound to result in friction and delay. It appears, also, that whilst some officials were impressed with the vital urgency for expedition others were more concerned to conduct matters in accordance with the regular routine of peace procedure. But there was no intervention by an outside department or ministry to save the situation. It is not on record that the French Ministry of Marine collaborated in the creation of the *Chars d'Assaut*. On Feb. 25, after some inter-departmental discussion and trials of a baby Holt tractor, and without waiting for the construction of any experimental machine, an order was placed with the Schneider firm for 400 tanks, then called *tracteurs Estienne*, afterwards known as *Chars Schneider*, to be delivered within six months. This was only two weeks after orders had been placed by the British for the first 100 Mark I. tanks. So far the comparative progress in development of the new arm by the two nations had been as follows:—the idea of the tank had occurred at about the same time to both; the matter had been put forward officially by the British in the third month of the war and by the French 14 months later; the first actual order for machines, given by the British 18 months after war began, was followed by that of the French only a few days later. The British machines, however, took the field six months before those of their Allies. In addition to the 400 Schneider tanks a contract for 400 more machines of a different type was placed with the St. Chamond Works in April, without the knowledge of the commander-in-chief or of Col. Estienne.

Not long afterwards steps were taken for the formation and training of personnel for the new arm at Marly-le-Roi. In June French H.Q. received from British G.H.Q. official intimation of what was being done in England. Col. Estienne visited England, and after inspecting the Mark I. tank in the training area at Elveden reached three conclusions. One was that the two countries should collaborate in the production and coöperate in the use of the new weapon in the field. The second was that neither should forestall the other in employing it and so discount its maximum value for the Allies as a whole. On this Col. Estienne was specially insistent, because it was apparent that the British were far ahead in production and would probably be ready before the French. The third was that as a complement to the heavy, somewhat slow, British tanks, capable of negotiating almost any obstacle, the French should specialize in the production of a speedier and more handy machine, which would be to the British tank what field artillery is to heavy artillery, would perform the duty of a swarm of skirmishers in armour armed with a machine-gun, and would be capable of going wherever an infantry soldier could go. The scheme for light tanks did not meet with a favourable official reception, and sanction for the construction of 50 machines of this type was not given. Nevertheless designs were put in hand by the Renault firm and at the end of Nov. were so far completed that construction could have been started. Though no executive action was taken for some months, except that 150 machines for use as "command" tanks for the units of the *Artillerie d'Assaut* were given, this was the genesis of the Renault tank.

---

[1] For convenience the word "tank" will be used generally to describe the French machines.

The French classified tanks in three categories:—

Chars legers, machines weighing under 10 tons.

Chars mediums, machines weighing 10 to 30 tons, which could be transported by rail on ordinary trucks.

Chars lourds, machines which would require specially constructed trucks for transport by rail.

As the medium tanks were the first constructed and used, their description will be given first. Both the Schneider and St. Chamond tanks were smaller and lighter than the British Mark I. or any subsequent pattern of heavy machine, and were, according to British nomenclature, males. The great difference between them and the British heavy tanks was that the designers of the former, in taking the caterpillar tractor as a model, had been content to employ tracks somewhat similarly placed under the body of the machine, and not extending all round it as in the case of the British heavies. The tracks were also shorter than the full length of the body, instead of projecting well beyond it, at least at the front, as was the case with the British Whippets, and the French Renaults, and both tanks had a particularly "underhung" appearance. It was this arrangement of the tracks which militated against the climbing powers of the machines, whilst their comparative shortness limited the spanning powers across a trench.

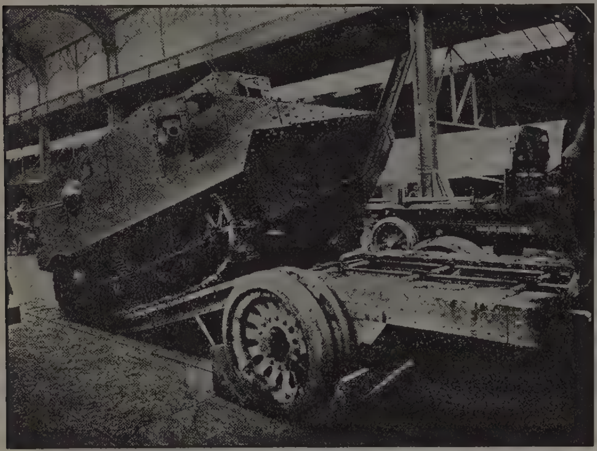

FIG. 9.—French Char Schneider.

The *Char Schneider* (see fig. 9) was 6 metres in length, 2 metres in width and 3·40 metres high. It consisted of an armoured body resting on two horizontal girders with the necessary bracing. The weight was taken by springs on two bogies on each side, which were carried by the track rollers. The track was actuated by a driving sprocket at the rear, there being an idle wheel at the front. The gear-box was at the rear, the radiator in front. Power was given by a four-cylinder Schneider engine of 60 horse-power. The petrol feed was by pressure. Steering was effected by driving the tracks at different speeds. The whole body formed a box of somewhat peculiar shape protected by hardened steel plate of 11·4 mm. thickness on the walls and 5·4 mm. on the roof. There were various openings with movable shutters for observation, etc., and the door was at the back. In front was a steel prow, or beak, to prevent the machine dipping too much when descending into a cavity. The armament consisted of one short 75-mm. gun, of a maximum useful range of 600 metres, mounted on the right cheek of the bows of the machine which could from its position fire only on the right side and not directly ahead. There was also one Hotchkiss machine-gun on each side firing through a spherical shield mounting. For the gun 90 rounds of ammunition were carried and for the machine-guns 4,000 rounds. One officer, one N.C.O., and four men, of whom two were machine-gunners and one a gunner, formed the crew. The officer drove. The total weight of the machine was 13·5 tons and its useful speed from 2 to 4 km. per hour. It could cross trenches of from 1·50 metres to 1·80 metres in width, and carried petrol for 6 to 8 hours' work.

The *Char St. Chamond* (see fig. 10) was a larger and heavier machine. It was 7·91 metres in length, 2·67 metres in width and 2·365 metres or 2·35 high, according to the pattern. It consisted of an armoured body in suitable framework suspended on spiral springs on three bogies on each side, which were carried by the track rollers. The drive was through the rear sprocket. The driving mechanism was petrol-electric and consisted of a four-cylinder Panhard engine of 80–90 H.P. with electric self-starter, a dynamo of 52 K.W. power and two electromotors, one driving each track. Driving was done by a "tramway" control, by which speed and direction were regulated. This system had great conveniences, for the machine could be driven from either end without effort, but it had the drawback of being somewhat complicated and delicate. The petrol feed was by pressure, and the tanks were two superimposed on the left side and one on the right. The whole body formed a box with a square sloping front without any beak. It was enclosed in hardened steel plate of 11 mm. thickness in the front shields, and 8·5 mm. at the sides and 5 mm. on top. On the roof there were three observation cylindrical *capots* with sides of 11-mm. steel above the commander's and driver's ports. The doors were at the sides. The armament consisted of one 75-mm. field gun, except in the first 175 machines which had a special gun, firing ahead in front, and four Hotchkiss machine-guns, one in front to the right of the gun, one on each side and one on the rear face. For the gun 106 rounds of H.E. were carried and for the machine-guns 8,488 rounds of S.A.A. The total weight, loaded, was 24 tons, and its useful speed on the flat 8·5 km. per hour. It could cross trenches up to 2·50 meters in width in good soil. The petrol carried was enough for from 6 to 8 hours. The crew consisted of one officer, one N.C.O., two gunners, four machine-gunners and one mechanic, or nine in all.

During Sept. the first tank of each type arrived at the training centre, where a considerable number of officers and men from different branches of the Service had already collected for preliminary individual instruction. An additional training centre for the formation of units was established at Champlieu, and also a depot for the assembly of *matériel* at Cercottes, near Orleans. It was then decided, also to create the new "*Artillerie d'Assaut*" and the charter of this organization may be said to date from the 30th of that month. Col. Estienne was promoted to the rank of general, and was appointed "*Commandant de l'Artillerie d'Assaut aux Armées*" and representative of the commander-in-chief in tank matters with the Ministry of Munitions, which department had been created and taken over tank production. In Oct., with the arrival of more machines of both types, the *Artillerie d'Assaut* started on its career. It seems that the use of the British tanks at Cambrai, which had been deprecated by the French beforehand, and criticized for the reasons already stated, may have stimulated the French to press on with their own service, though what had been looked upon as the supreme factor of surprise had been discounted.

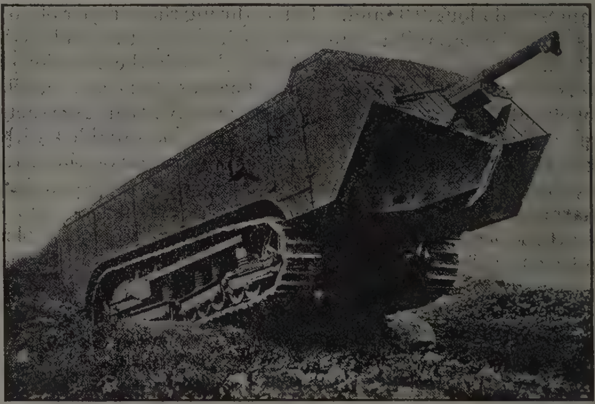

FIG. 10.—French Char St. Chamond.

The work of preparation, including training and equipment, continued throughout the winter, in preparation for the offensive to be undertaken in the spring of 1917. On March 31 1917, the organization of the *Artillerie d'Assaut*[1] was as follows: The tactical unit, under a captain, was the *groupe*, which was divided into four batteries, each consisting of four tanks. A *groupe*, therefore, comprised 16 tanks with a special "command" light tank (Renault). For a Schneider tank *groupe* the establishment was 18 officers and 92 other ranks, for a St. Chamond tank *groupe* 18 officers and 106 other ranks. A *groupement* consisted normally of four Schneider or three St. Chamond *groupes*, but was not rigid. For repair work each *groupe* had its own workshop and a *Section de ravitaillement et de reparations*

---

[1] Why this arm was ever called "artillery" is not clear. Its closer connexion with, and resemblance to, infantry was recognized later, and the names of the elements of the organization for the light tanks followed those of the infantry, *e.g.* battalion, company, etc.

(S.R.R.), of 1 officer, 111 other ranks, was allotted to every 10 *groupes*. There was for the whole unit a *Section de parc*, or repair park, similar to that of the Mechanical Transport Service. This was found necessary so soon as tanks had been delivered in any number, owing to the amount of tuning-up, minor repair work and even alterations which had to be done.

Numerous faults at once developed in these entirely new machines (as had been the experience of the British), but thanks to the time available before they went into action, certain defects were discovered and remedied. The first was that some parts of the machines wore out very quickly, necessitating the maintenance of a very large stock of spares. The thickness of steel plate where vertical was not proof against the German "K" bullet, and it was found necessary to add an outer plate of 5·5 mm. to the vertical armour of the Schneider machines, and 8·5 mm. to that of the St. Chamond machines. On the whole the defects discovered in the Schneider tanks were not such as to give reason to suppose that they would not be able to go into action in the spring; but those of the St. Chamond were more serious. The design was found clumsy and the machine liable to ditch. In addition to breakdowns in the power system and failure in details, there was a lack of rigidity in the whole machine, and the tracks of the first machines were too narrow.

Delivery of both types was extremely slow, especially of the St. Chamond machines. At the end of March, though personnel for 15 of the latter was ready, there was not one machine serviceable. At this time, on the eve of the great 1917 offensive of which so much was expected, the *Artillerie d'Assaut*, instead of being in possession of the 800 tanks which were to have been ready by the previous autumn, had received not more than 208 Schneider and 48 St. Chamond machines. There were for this operation, therefore, only 8 fully and 2 partly trained *groupes* of Schneider and 1 of St. Chamond tanks, and not 40 *groupes* as originally contemplated; and of the 160 Schneider machines only one had been fitted with the extra bullet-proof protection. In view of the diminution of the tank force from what was expected to be available, and with the example of the result of the action of the British in the previous Sept. before it, the French High Command had grave doubts whether to make use of tanks in the coming operations or to wait until there should be sufficient to exercise a greater influence. It was finally decided to throw all possible weight into the attack.

April 16 was the baptism of fire of the French tanks, in Gen. Nivelle's unsuccessful attempt to break through the German line along the Chemin des Dames, E. of Craonne.

Eight Schneider *groupes* coöperated with the French V. Army. They were divided into two parts of three and five *groupes* respectively. One party did not succeed in crossing the German line, though a few machines reached it, and it suffered severely from the enemy's guns posted on the Craonne Plateau. The other party succeeded in crossing the enemy's second line, but were not followed up by the infantry, owing to the German machine-gun fire. Two Schneider *groupes* and one St. Chamond *groupe* allotted to the French IV. Army for employment on the 17th were not thrown into the fight, as the German artillery observation posts were not first captured by the infantry—a lesson of the action of the 16th. The offensive failed; and though the new arm showed the utmost devotion and gallantry, and its intervention saved many lives, it did not achieve the success that was hoped. But the conditions were almost as unfavourable for the employment of tanks as they could be, and the tactics employed were not those urged by those responsible for the new arm. The attack was not a surprise, being preceded by a heavy bombardment, which, however, did not succeed in overcoming the German artillery, and was made in broad daylight, without any smoke-screen, against a position which permitted of direct observed artillery fire against the tanks both when approaching and when they reached the enemy's positions. The plan, also, in which certain infantry units had been trained to coöperate, was that the tanks were to attack the German third defensive line after the infantry should have gained the first and second, and were not to advance until after this had been achieved. The Germans, who were prepared for the attack, therefore, had even additional time before the tanks appeared, and the result was that their guns caught many of the machines in column before they deployed.

The machines themselves showed certain faults—they were deficient in speed and climbing capacity, the latter defect being accentuated by the fact that since the Somme the Germans had increased the width of their trenches. They also proved, as was known before would be the case, vulnerable to direct hits of H.E. shell, by which many machines were set on fire. Amongst other points of design in which modification was found necessary was that of isolating the petrol tanks from the interior of the machine, improving the means of communication, the power of observation, the ventilation, and various details of mechanism, and of widening the tracks. On the whole the Schneider machines stood the trial best.

In the next tank attack, carried out on May 5 by the VI. Army, the battle of Laffaux Mill, the three *groupes* employed advanced with the infantry with marked success, especially in the case of the Schneider machines. The counter-battery work of the French was good and the enemy observation posts were destroyed or masked; and the tanks did not remain too long in advanced positions where the infantry were checked.

For nearly six months the tanks did not again go into action. During this period great efforts were made to remedy the defects disclosed, to expedite the delivery of machines, which was much in arrears, and of spare parts, the demand for which (as in England) had been found very greatly to exceed any anticipations, and to augment the establishment of repair units. In preparation for the next operation great care was taken in the training of infantry with the tanks in attack and in tank tactics generally. On Oct. 23 five *groupes* of tanks took part in the battle of La Malmaison along the Chemin des Dames. Their assistance was most valuable.

Owing to previous heavy rain, and the bombardment which had continued for six days and six nights, the ground was extremely difficult, and in the centre the tanks were not of so much help in the first phase of the attack as later. This state of the ground and the lack of surprise again discounted to a great extent the preparatory training undergone by the units of the *Artillerie d'Assaut*. The practice which had been carried out beforehand with the attacking infantry, however, proved of great value, as did the work of the special unditching sections. The ground had been carefully reconnoitred and aerial photographs supplied. The Germans relied on this occasion more on their advanced field guns for defence, and had also organized numerous special machine-gun posts furnished with plentiful supplies of armour-piercing ammunition. But owing to the counter-battery work of the French the tanks were not so much damaged by the German guns as in April, in spite of the fact that the attack was not a surprise. Two days later some St. Chamond machines again operated with success.

Apart from the projected light tanks, the necessity for an improved medium tank had been realized before April 1917, and the subject was under consideration throughout the year. The main directions in which the April offensive showed improvement to be necessary were the desirability of mounting the gun in a turret to give all-round fire, of mounting a 75-mm. field gun in place of the shortened 75, and of increasing the size of the tracks and the power of the engine. Designs for a new medium machine (C.A.3) were prepared in Aug. 1917, but were abandoned after the battle of La Malmaison because the further improvement then found desirable, *i.e.* the provision of 6 to 7 H.P. per ton weight, a trench-crossing capacity of 3 metres, and an ability to climb ahead or astern, showed that the designs were already out of date, and would be more so by the time the machines could be made. At the end of Oct. it was decided to suspend the construction of an improved type of medium tanks and to concentrate on that of the light machines; and in Dec. the idea was finally dropped. The question of providing heavy tanks was taken up at the end of 1916 as a result of the operations of the British machines in Sept., and in order to have available a machine which would be complementary to the light tanks it was hoped would be made. A project was put forward for a heavy tank weighing 38 tons to carry a 105-mm. gun, but its execution was postponed in view of the demands that might be made for other machines. Two experimental heavy tanks, one with mechanical and the other with electrical transmission, were tried, and it was decided to investigate in the direction of still heavier machines.

In regard to the type which will always be especially associated with the French, the *Char leger*, or Renault tank, first suggested by Gen. Estienne in July, and for which designs were prepared in Nov. 1916, the commander-in-chief in that month expressed his desire for 1,000 of such machines. But whereas those responsible for supply had, in the case of the medium tank, pressed forward the construction of one type, the St. Chamond, without military approval of the design, in the case of the Renault every obstacle seems to have been placed in the way of manufacture of this machine, for which army H.Q. and the *Artillerie d'Assaut* were pressing throughout the winter, though various trials were made. In March 1917, the demand of army headquarters was increased, being based on the requirements for an offensive on a 100-km. front. This entailed the production of 3,000 light, 400 medium (improved Schneiders) and 150 heavy tanks. In May an order was given for 1,000 Renault machines in addition to 150 which had been ordered in March as "command" tanks. Discussion as to design, armament and manufacturing facilities and trials continued during the summer of 1917. In Oct. it was settled that in addition to the 1,150 already on order, 2,380 more should be made, or 3,250 in all, the work being distributed between four French factories, the whole to be delivered by the end of July 1918. Of the total, 1,000 machines were expected to be ready by March 31 1918, for the contemplated offensive in the spring, and 1,000 were to be manufactured in the United States, of standard American parts and equipped with Liberty engines. The decision to devote so much money as this entailed and so much of the manufacturing power of the nation at a moment when the demands for munitions of war of other kinds was at its height illustrates the importance now attached to the new arm. The British success at Cambrai seems to have had considerable effect in influencing those who were still sceptical of the value of the tank and of the wisdom of relying on it for future operations. In Jan. 1918 a supplementary order was placed for 470 machines, the final total figure fixed for production in France being 4,000, divided into 1,000 armed with machine-guns, 1,830 with the 37-mm. gun, 200 signal tanks, and 970 for a reserve armed with the 75-mm. gun.

The Renault tank differed greatly from the Schneider and St. Chamond machines. Not only was it considerably smaller, but the tracks were outside the body and not underneath it and extended to a considerable distance in front. Its total length, without the movable tail, was 4·100 metres; its breadth 1·740 metres, and its height 2·140 metres. The body was supported on hollow longitudinal girders by a hinge arrangement at the rear end and suspended on powerful springs in front so that the front of the frame and body were capable of relative movement. Each girder was carried by springs on four bogies supported by wheels running on the tracks. The idle track pulley in front was of larger diameter than the driving-sprocket at the rear and this and the projection of the tracks gave the machine a greater grip in climbing over obstacles. The upper portion of the track ran in spring guide rollers which were arranged to regulate the track tension automatically. The interior of the tank consisted of a driver's compartment in front and the engine-room behind. The crew comprised two, one officer or N.C.O., who was also the gunner, and one man who was the driver. The driver was seated; and also seated, or standing, behind him was the gunner, with his head and shoulders in the turret. The latter revolved on ball-bearings which allowed of all-around fire, and was furnished with a lock and a door at its back. The whole of the machinery, engine, radiator, clutch, transmission gear and petrol tank were in the engine-room, separated by a steel bulk-head pierced by openings closed at will from the driver's compartment. Power was given by a four-cylinder Renault engine of 35 H.P., with the usual transmission. Steering and control could be done by one man. Protection consisted of hardened steel plate 16 mm. thick for the vertical portions (proof against the armour-piercing bullet) and 8 mm. for other parts. The armament was either a 37-mm. Puteaux semi-automatic gun, or a Hotchkiss machine-gun; and 240 rounds including 40 rounds of case shot, or 1,820 rounds of S.A.A. were carried. Fully loaded the female weighed under 6½ tons and the male just over 6½ tons. There were four speeds ahead and astern giving to the tank a maximum speed on the flat of 7·78 kilometres. It could climb slopes up to 45° and span openings up to 1·80 metres in width, in which it was assisted by the movable tail. This was the machine upon which the French relied for the operations of 1918. The question of the provision of Renault wireless signal tanks was taken up in May 1917, and a machine capable of sending and receiving wireless messages was constructed.

In the autumn and winter of 1917 the reorganization and training of the *Artillerie d'Assaut* continued with a view to its expansion. In addition to the medium tanks still being delivered, it was expected, by March 31 1918, to receive 800 of the Renault tanks then due. The establishment of the *Artillerie d'Assaut* was tentatively fixed as follows:—four *groupements* (16 *groupes*) of Schneider tanks, with four repair sections; four *groupements* (12 *groupes*) of St. Chamond tanks, with four repair sections; 36 companies of Renault tanks; one *groupe* depot for Renault tanks; one salvage *groupe*; three park sections. The number of Renault companies was fixed at 30 before the end of the year. The organization of the Renault tanks, which were regarded as an infantry arm, was to be by sections, companies, battalions and later by regiments and brigades. A company comprised three sections of five tanks each and an *échelon de combat* of 10 tanks (of which one was a wireless signal tank),[1] or 25 machines in all. A battalion contained three companies of 75 tanks. Changes were made in the administration, and Marly-le-Roi was given up as a training centre, two army group-training centres being established at Mailly-Poivres and Martigny, the training facilities and auxiliary services generally were increased and elaborated, and the relation of the *Artillerie d'Assaut* to the Ministry of War was defined and simplified. All these preparations were carried out with a view to the coöperation of the tanks in the French offensive in the spring.

When the German advance on March 21 1918 wrested the initiative from the Allies, amongst other results it upset all the plans carefully worked out for the French tanks. Instead of taking part in mass in a great offensive, as intended, whatever tank units existed had now hurriedly to be collected and thrown into the defence. The factor ruling the speed of the creation of the service had all along been the rate at which the *matériel* was delivered. This, for various reasons, was always much behind the scheduled time arranged. On March 21 the medium tanks in a serviceable state fit for immediate use amounted in number to 245 Schneider and 222 St. Chamond, or 467 machines of an obsolescent type, and of the new Renault tank 1 machine ready for action, with the army. (By the beginning of April over 400 had been turned out by the factories. But these were made up of training machines without armament or armour, pattern machines, machines issued to the American army for training, and those under test.) Moreover the approach of the Germans necessitated the hurried evacuation of the tank centre and main park at Champlieu. And so, not only was the new arm, still in its early infancy, forced to face an entirely fresh situation with improvised measures, but part of its organization was suddenly torn up almost before it had taken root. Great efforts were made both to assist in coping with the immediately urgent necessity of checking the enemy's advance and to prepare for subsequent action. Champlieu was reoccupied in the beginning of April, when the progress of the Germans to the north was checked; but a central reserve park farther from the front, near Fontainebleau, and three others were established.

Operations during April and till the end of May were confined to the medium tanks, which alone were available and mobilized. Four *groupements* of Schneider machines were allotted to the III. and I. Armies, joined later by three of St. Chamond machines. All the actions now undertaken were, as was the case with the British tanks, of the nature of minor counter-attacks, and not such as the tanks were best suited for. They took place, on April 5, at Grivèsnes; on April 7 at Sénécat; and on April 8 at Cantigny, the last being in coöperation with the American troops. The most successful was the last, in which the action of tanks had been legislated for. The artillery bombardment was short and portions of ground were left unshelled to allow of the passage of the tanks. Though not actually fighting, the tanks were at this period continually being moved about in readiness, and to save wear and tear the system was adopted of transporting them by road on special "tugs" drawn by caterpillar tractors.

On May 31 the Renault machines received their baptism of fire on the E. of the Forest of Retz. Three battalions of these machines now ready were allotted to the VI. Army, and were brought up by train, on lorries and on tugs. Six sections had to be flung into the fight. Without previous reconnaissance or any liaison with the already exhausted Colonial infantry, who had never seen a tank, they had practically to make a cavalry charge in broad daylight, without a smoke-screen, across a mile of open plateau under observation of captive balloons and without effective support from their own guns. One condition favoured their action; their attack was a surprise.

---

[1] Owing to delays in manufacture and difficulty in technical training the first wireless signal tanks did not take the field until July 1918, when after some practice they were found of great value. As has been stated British tanks were fitted with equipment and trained operators ready for the field in July 1916.

Though the tanks succeeded in clearing the enemy out of their positions, their success had no tactical result, for the infantry could not follow up and consolidate the ground gained. But they caused panic, and inspired a nervousness and hesitation amongst the Germans which was invaluable at the moment. This and their subsequent actions carried out during June served to prevent the enemy from penetrating into the forest.

Meanwhile, four *groupements* of medium tanks led and greatly assisted Gen. Mangin's counter-stroke at Méry-Belloy on June 11 against the flank of the German salient between Noyon and Montdidier, by which the enemy's progress toward Compiègne was arrested. The tanks played a great part in this operation which had such strategic importance, but this action was the high-water mark in the career of the medium tanks, for they were becoming worn out and were gradually replaced by the new and more efficient Renault tanks as the latter were produced.

By July considerable progress had been made in organizing and equipping fresh units, and the *Artillerie d'Assaut* was able to coöperate on a large scale in the battle of Soissons, Gen. Foch's decisive counter-stroke of July 18 and following days, against the German salient formed between Château-Thierry and Reims. This was the vindication of the French tank arm. To the X., V., and VI. Armies were allotted respectively six, one, and one *groupements* of medium tanks, and to each three battalions of Renault tanks, or a total for the operations of eight *groupements* of medium and nine of Renault tanks. The battle, which lasted from July 18 to the 23rd and 26th, so far as the tanks were concerned, formed a turning point in the war. The entire operation was based on the action of the tanks; every available machine was thrown into the fight; and they were given a chance of showing what they could do.

The tactics employed were those which had been urged all along by Gen. Estienne and M. Breton, and were a repetition of those initiated at Cambrai. The attack opened with the advance of a mass of tanks without preliminary bombardment, as it happened, in a slight fog, and was a complete surprise. Similar tactics on a smaller scale were made use of again after the first day, but on the 23rd the tanks suffered severely from the enemy's guns. Two battalions of Renaults acted with the VI. Army east of Reims on July 16-17, and coöperated with two medium *groupes* with the IX. Army on July 18 near the Marne, and some with the British on July 23 near Espilly. In these operations, especially the main attack on July 18, the tanks achieved what it had been claimed they would if properly used. On July 30 the commander-in-chief issued a special Order of the Day to the *Artillerie d'Assaut*—"*Vous avez bien mérité de la Patrie*," whilst Gen. Estienne was made a commander of the Legion of Honour and promoted general-of-division.

The battle of Soissons had a great effect on succeeding operations. It established the value of the tanks beyond all doubt, inspired enthusiasm in all that concerned the arm and expedited the manufacture of the machines and the training and organization of new units. Without giving even the list of actions in which the tanks took part to the end of the war, it can be said that the infantry now clamoured for their assistance, in spite of their faults and failings, and they were employed whenever possible. They were asked for by the commander of the VI. French Army when transferred to Flanders, and on Sept. 30 and several days in Oct. were in action. Some were also sent to Salonika. Out of the 120 days between July 15 and Nov. 11 they were used on 45 days, and the casualties suffered amounted to 300 officers and 2,300 other ranks. During 1918 3,988 individual engagements were fought: 3,140 by Renault, 473 by Schneider and 375 by St. Chamond tanks. Toward the end their actions amounted to disposing of the enemy rearguard machine-guns which continually held up the infantry.

By Aug. the machinery of production and training had been so improved that it was found possible to turn out one battalion of Renault tanks (75 machines) per week, which implied a vast increase in the whole of the rear organizations, which were now of a capacity for the continuance of the tank effort on a greater scale in 1919. As in England the production of tanks had become an industry. Though the construction of medium tanks had been abandoned, Gen. Estienne's opinion as to the necessity for heavy machines had not changed from the time in Feb. 1918, when he had asked for 900. But the same influences that had in 1917 retarded the introduction of the light tank were now adverse to the contemplation of heavy machines. To provide such machines an Inter-Allied factory was established, but this was not completed before the Armistice. In Oct., negotiations which had been carried on with the British Government resulted in the promise of some Mark V. and Mark V. Star tanks. Of the latter, 77 were handed over in November.

In Aug., at the instance of Gen. Foch, an Inter-Allied tank school was opened in France. It was equipped with a staff of French and British instructors and various types of British and French machines. This school was for the interchange of views and the establishment of a common basis for tactics and staff work concerned with tanks.

The reliance that had come to be placed on the *Artillerie d'Assaut* can be gauged by the fact that in Oct. 1918 its actual strength in the field amounted to 18,023 of all ranks.

Since the war the French have been continuing their development of cross-country machines. The construction of a very heavy armoured tank was in hand in 1921, while a much lighter machine, the "Kegresse," of Russian invention, had been tried. It consists of the substitution of small rubber tracks for the rear wheels of a motor-car. It is light, cheap, can travel on the flat at a speed of 15 to 20 m. per hour, and can cross any country over which cavalry can pass. An amphibious tank propelled on land by tracks and on the water by a screw has also been tried successfully.

AMERICAN TANKS

Though the tank had not accomplished much in the way of results by the time that the Americans came into the war, in April 1917, its military potentialities were at once appreciated by them, while its mechanical side appealed to their national genius. But hostilities did not continue long enough for them to bring their vast resources to bear on its development. The Americans lost no time in inquiring into the subject, and at once requested information as to designs, etc. At this time there was some doubt as to whether the tanks should not be taken up by the American Marines, but the final decision was in favour of the Army. In June the commander-designate of the American Tank Corps, Col. Rockenbach, arrived in France, and an officer was detailed to inquire into the technical aspect of the tank arm. An Inter-Allied Tank Bureau was also established. In Sept. a scheme for an American Tank Corps, to consist of five battalions of heavy tanks and 20 of light tanks, was approved, and in Oct. an expert technical officer reached England to consider further the question of development.

The question of the provision of machines and spare parts, which had proved such a difficulty with the British and French, was also taken up. It was realized that in matters of design, it would be best for the Americans to profit by the experience of the British and French, whilst relying, as far as possible, on their own resources for *matériel*, and it was decided to adopt a heavy tank of the British type, and a light tank of the French Renault type. As a result of consultations between the British and French Ministries of Munitions and the American commander-in-chief as to joint production, an Anglo-American commission was appointed in Dec. to deal with the question, and in Jan. 1918, an agreement was signed by the two Governments for the manufacture of tanks in France. It contained, amongst others, the following main provisions:—that a factory capable of producing 300 tanks a month, and of being extended to turn out up to 1,200 a month, should be erected in France at the expense of the two Governments; that 1,500 machines, or more if required, should be made during 1918; that, in broad terms, in accordance with national facilities for production all the machinery should be of American and the structure and armament of British manufacture, the armour plate being of American steel, and that the first 600 tanks should be allotted to the Americans, and the remaining output as agreed upon, including sale to the French. The type of machine was to be the "Liberty" or "Allied" tank, which was the British Mark VIII. machine equipped with the Liberty aero-engine.[1] It was decided during the summer that an additional 1,500 of these tanks should be built in the United States, as well as several thousands of Renault machines. The scale of this programme shows what importance was attached to this arm by the Americans. The site chosen for the factory was Neuvy-Pailleux, near Châteauroux, and work was started there in the spring. But the building was not completed till Nov., so this scheme of joint production did not actually come to fruition, and although preparations were made for a vast output of machines in America, by the Armistice the manufacture had only recently reached the stage of production and only twenty odd American-built Renault machines had reached France. All the tank operations in which the Americans took part were therefore carried out with British or French machines.

---

[1] The first Liberty tank of British structure and American mechanism was assembled and successfully tried in America in Nov. 1918. One machine was constructed in England by the end of 1918.

As to *personnel*, in Feb. 1918, 500 volunteers from the American army assembled at Bourg in France for instruction, and from the next month onwards three companies of soldier mechanics assisted at the repair depot at Bourron. The establishment of the American Tank Corps was increased in May to 15 brigades (five per army), each consisting of one heavy and two light battalions. Owing to the lack of machines in America it was necessary to send the units of the Tank Corps for training with the machines to England and France, a camp being established at Bovington, in Dorset, the British tank-training centre, for training the heavy tank units, and at Bourg for that of the light tank units under French supervision. In addition to 25 instructional machines, with accessories and spares, previously supplied, 144 Renault tanks, the complement of two light battalions, were handed over in Aug. to the Americans. Two battalions were at once mobilized and took part in the attack of the St. Mihiel salient by the American I. Army on Sept. 12.

The entry into action of these units was somewhat disappointing. The tanks had to travel far from their positions of assembly to the battle, and on the first day they operated over such difficult ground that they did not catch up with the infantry, who were able to move forward rapidly owing to the comparatively feeble resistance of the enemy. On the second day they were unable to obtain petrol, and on the third day they did not have much fighting, but took a number of prisoners. The machines were practically undamaged by the action. Their next operations were with the French in the Argonne, where they were of considerable assistance. From this time until the middle of Oct., when they were re-formed into one company, they were continually at the disposal of the infantry commanders, but did not often take a coöperative part in action, though they travelled miles, being used mostly for reconnaissance and for attacks against strong points which had checked the infantry. After that date they accompanied the American forces in the advance right up to the end. One heavy tank battalion which had been trained in England took the field on Sept. 29 with the American II. Corps, in the attack on the Hindenburg line. On this occasion ten tanks were destroyed by running into an old British minefield, and the American infantry here suffered severely from the German machine-guns. On Oct. 8, the battalion coöperated most usefully with the American II. Corps, and again on Oct. 17, when the River Selle was crossed. Finally they assisted the British on Oct. 23 in the neighbourhood of Le Cateau. This ended the operations of the units of the Tank Corps.

The chief characteristics of the action of the Americans in regard to tanks was their quick appreciation of the value of the arm. But the extent of the preparations made for a continuance of the struggle in this as well as in some other directions prevented a greater part being played by the American tank forces in the field. Had the war continued it would have come into play with overwhelming effect.

Since the Armistice the Americans have pressed on with the development and application of the caterpillar track system for road and cross-country transport generally. Most of their efforts in this direction have been concentrated on the "motorization" of artillery traction, and a considerable amount of literature has been published foreshadowing the future ideal as elimination of the horse for military transport purposes. Experiments have been and are being carried out with different types of self-propelled vehicles on the caterpillar track, and combined wheel and track principles. One machine of the latter type recently covered 251 m. in 17 hours. Of fighting tanks, the Mark VIII. of 35 tons is still the standard heavy machine, but experiments are being made with modified Renault and Ford light tanks, and a water-crossing machine. On the whole the Americans seem to be greatly impressed with the part that will be played by machines in the warfare of the future and have made great steps in applying track propulsion to military uses.

German Tanks

In spite of rumours, the first appearance of the British tanks came as a complete surprise to the Germans. In Dec. 1913, and again toward the end of 1914, proposals had been made in Germany for an armoured automobile on caterpillar tracks; and in the summer of 1915 some experiments in this direction had been carried out; but no steps were taken to proceed with the idea. In Oct. 1916, after the appearance of the British tanks, of which they temporarily captured one, the question of constructing similar machines was taken in hand by a special commission, and drawings were prepared. Construction, however, was postponed, owing to the lack of coal and steel, and to the economic conditions generally. H.Q. appears then to have become doubtful as to the necessity for these weapons, and did not give this service first priority of urgency. This was actually not done until the summer of 1918. This lack of interest or apathy on the part of the Germans came as a surprise to the Allies, for it was anticipated that so soon as the secret was out the enemy would use every endeavour to copy and improve on the machine and press on with mass production so as to make up if possible for the start the Allies had gained. For a long time opinion in Germany remained divided as to the value of the weapon, partly owing to the mechanical imperfections of the original Allied machines and partly owing to the manner in which they were first used, especially during the summer of 1917.

Nevertheless, manufacture of a tank, known as type A.7.V., apparently the result of the deliberations of the commission already referred to, was commenced in the spring of 1917. Only 10 of these machines were ready for the offensive in March 1918, whilst not more than 20 were completed by the end of the war. Designs for a heavier type, also, were started about the same time, of which the first model was to have been ready in Dec. of that year, but it was still unfinished at the end of the war. Experimental construction of a small light tank was also commenced, and orders for these machines were placed in the summer of 1918, to be ready by the spring of 1919. This contract, also, was cancelled at the suspension of hostilities.

The French attack at La Malmaison in Oct. 1917, and then the British attack at Cambrai somewhat changed the aspect of affairs. The British tanks captured by the Germans in their counter-attack after the latter action were collected at Charleroi and repaired; and the question of production in quantity of a German tank based on the British type was considered, only to be dropped, owing to the shortage in man-power. In Jan. 1918, the first "Sturmpanzerkraftwagenabteilung" (Tank Section), of five German A.7.V. machines, was formed and brought with its auxiliary transport up to the western front for training. The captured tanks, also, were organized in sections of five machines. The personnel establishment was on an extravagant scale, no fewer than 176 of all ranks being allotted to a section of German machines, and 140 to a section of captured British machines, as against the British establishment for a similar section of 41 of all ranks. In all, three sections, comprising 15 of their own tanks, and six sections comprising 30 captured machines, were used by the Germans in 1918. Some of the latter were re-armed with 5·7-cm. Russian guns.

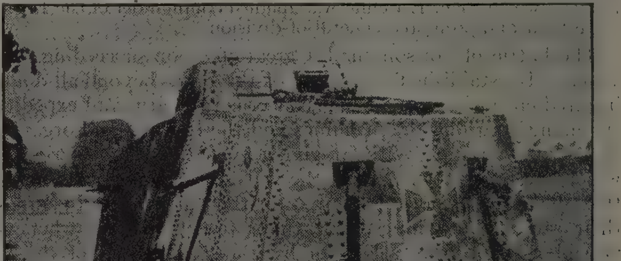

Fig. 11.—German A.7.V. Tank.

The description of the A.7.V. machine (see fig. 11) is as follows:—weight, 32 tons; length, 7 metres; width, 3·2 metres; height, 3 metres; armament, 6 machine-guns and one 5·7-cm. gun; protection, armour 30 mm., 20 mm. and 15 mm. thick; crew, 1 officer, 15 other ranks (mechanics, gunners, machine-gunners); power, two 100-H.P. Daimler engines, each driving one track; climbing capacity, trenches of 2·5 metres width. The German tank was a clumsy machine and a bad climber, owing to the underhung tracks. It was powerfully engined and its tracks were carried on spring bogies which enabled it to cover 8 m. per hour on the flat. The thick armour was proof against armour-piercing bullets at short range and also against light-field-gun shells; but the joints between the thick plates rendered the crew liable to bullet splashes, which was a serious defect.

The Germans used their tanks on nine occasions in 1918, commencing with their advance on March 21, the most successful action being when they captured Villers-Bretonneaux on April 24, 12 German machines coming into action on this occasion. The result of the appearance against the British of hostile tanks, especially on this date and later, on Oct. 8 in the Cambrai sector, when 15 captured British machines were used, was sufficient to confirm their great moral effect and the feeling of helplessness engendered in infantry by them. It showed that it was not only the Germans who could not stand up against the attack of these machines, for the British infantry fell back on the report of the appearance of German tanks as did the German troops at each appearance of the Allied machines, when the Allies were pressing forward. The German tank tactics do not appear to have been very thoroughly thought out, and consisted mostly of "mopping up." This is probably due to the smallness of the number possessed by them and the improvised nature of the arm. Moreover, the belief in their own powers of the members of the tank units must have been somewhat shaken by the official propaganda campaign which had been carried out for months by the High Command to discount the effect of the British and French machines.

According to one authority, the reasons that the Germans did not during 1917 whole-heartedly take up the organization of tanks in large numbers for their great effort in the spring of 1918 were that when they first became aware of their existence it was too late to carry out the successive operations of design, experiment and manufacture in bulk; and that owing to lack of raw material and shortness of man-power the manufacture of the machines would have entailed the cutting down of the production of other war *matériel*. There does not seem to be much force in the first argument, if it be remembered that 80 British tanks were ready equipped in the field within 13 months of the receipt of the specification by the designers, and this without any existing machines to serve as patterns. All along, the attitude of the German High Command seems to have been that of the staff and not that of the troops; and great endeavours were made to inspire the latter with the official views. Though official disbelief was seriously shaken by the surprise of Cambrai, the success of the German counter-attack 10 days later was used, illogically enough, to discount the effect produced by the previous assault by tanks. There was, however, a general and absolute revulsion of feeling after the great French success on July 18 1918, and the British actions of Aug. 8 and 21, which almost amounted to panic at H.Q., and converted both critics and military authorities. There were numerous articles in the German press during Sept. severely censuring the High Command for having neglected to provide tanks for the German forces and to undertake measures against the Allies' machines. Popular opinion became so strong that a stormy debate on the subject took place in the Reichstag in the following month, when the Minister of War made an apology for the neglect to equip the German troops with this weapon. There is no doubt as to the opinion of the German army and the nation on the subject of tanks from then on to the end of the war. For months after the cessation of hostilities the tank was called "*Deutschland's Tod*"—"the Death of Germany."

ITALIAN TANKS

A great part of the theatre of war in which the Italians were operating for so long was too mountainous for tank operations, and the question of the organization of a tank arm was not taken up by Italy until 1918. Manufacture of tanks was then started, and by the time the war came to an end one or more Fiat machines were ready to take the field, but none was actually used.

ANTI-TANK DEFENCE

The tanks used by the British and French during the war were designed to be bullet-proof only, not being strictly speaking "armoured," and were vulnerable to gunfire. The best active defence against them since they were moving targets, was the direct fire over the sights of as light a Q.F. piece as could insure penetration. Any field gun in use during the war, or light Q.F. guns of the "Pom-Pom" type, were sufficient. But as the tanks were mobile and could attack at any spot, often by surprise, to attempt to meet them with special or stationary guns in position would have entailed the distribution and locking up on the mere chance of attack of a prohibitive amount of artillery. The alternative was the provision of suitable guns themselves protected and capable of movement across country, so that they could be concentrated speedily when and where required. In other words, the correct reply to the tank was a type of male tank capable of rapid movement. The Germans eventually produced this reply in principle, in their own A.7.V. tanks, and by re-arming the male British Mark IV. machines and those of the French Schneider and St. Chamond (gunned) types which they had captured. This took place, however, too late and on too small a scale to influence the course of operations. Technically, also, the German machines failed in mobility across entrenched country. In order to effectively attack the German tanks by gunfire armour-piercing shell was required, for they were protected by hardened armour up to 30 mm. (1·2 in.) in thickness.

As the Germans were forced by circumstances to develop anti-tank defence, from which duty the Allies were almost entirely spared, the measures they adopted are here reviewed. Their action, which consisted for a long time largely of injunctions to the infantry not to lose their heads in the event of a tank attack, suffered from the continual inability or unwillingness of the High Command to take this weapon seriously, in spite of the lesson of Cambrai of Nov. 1917, till after the French attack on July 18 1918. In Sept. 1916 the Germans of course had no special means of defence against the tanks, of the existence of which they were ignorant, and these machines had an opportunity on their first appearance never to be repeated. After the Somme battle certain measures of anti-tank defence, seemingly based on a misunderstanding of the nature of the machine, were undertaken, mostly in the direction of obstacles, such as pits, etc., in roads, and indirect artillery fire. After April 1917, it was discovered that neither the British nor French tanks were proof against the "K." armour-piercing bullet, with which the troops had been equipped for use against loop-hole shields, and considerable reliance was placed on this fact. But this discovery did not help the Germans much, the tanks (Mark IV.) used in the next action by the British having had this to a great degree remedied. During that year the value of gun defence against tanks was to some extent realized, attention being mostly given to indirect fire which of all kinds is least effective against moving targets. A certain number of special direct-fire, anti-tank guns often in concrete shelters, were emplaced along the front. But not much attention was paid to the use of direct fire from field artillery normally in the sector attacked. This was not so on the occasion of the French attack on the Crayonne Plateau on April 15 1917, when the guns of the defence of all kinds did great execution among the French machines. At the battle of Cambrai again, some of the German field artillery were most effective against the British machines, one well-concealed gun served by a German major putting 16 tanks out of action.

During the period of preparation for the 1918 offensive the anti-tank rifle, which was a definite step forward, was evolved. This was a heavy, single-loading rifle of 530-mm. calibre, 5½ ft. long, weighing 36 lb., firing armour-piercing pointed bullets. The bullets penetrated the tank plates, though they did not necessarily place a tank out of action; but the weight of the weapon and its recoil hampered free employment by the infantry.

It was after July 18 and Aug. 8 1918, that the German High Command awoke to the danger threatening the German defensive, and indeed issued almost panic instructions. Special anti-tank defence officers were appointed to the different formations; guns were brought up to the front line and emplaced for action against tanks alone; and sections of reserve batteries were allotted to this duty, whilst all batteries (including howitzers) were to take up positions from which they could engage tanks by direct fire. The most efficacious of these precautions was the employment of the mobile guns of reserve batteries which were not so likely to be knocked out by barrage fire as those in positions closer to the front. Tanks became a bugbear, all sorts of precautions in the way of signals to notify their approach were taken, such as the installation of rockets, syrens, Klaxon horns; and permanent alarm posts were established. The passive forms of defence employed were: obstacles in the roads and entrances to villages, such as steel palisades, concrete blocks set sufficiently close together to prevent the passage of tanks and of sufficient height to be unclimbable, and mine craters. In some cases elaborate *chevaux-de-frise* were erected across stretches of the front; "booby-traps" such as tank-pits were laid and certain areas in the later stages of the operations were flooded. Mines were employed to an increasing degree, sometimes in large minefields. It does not require a great amount of explosive to damage a tank, and the mines laid by the Germans were usually electro-contact, or mechanical "tread" mines, which were fired by the weight of a tank passing over them, the charge being a gun or trench-mortar shell. But land mines have the drawback of being dangerous to those who use them, and the greatest damage done to tanks by mines during the war was to the British machines manned by Americans in July 1918, by a British minefield prepared during the retreat in March and forgotten. On the whole, all these artificial obstacles proved a failure, for they could not be continuous, and could be avoided by a cross-country vehicle.

The Germans finally took the obvious step of producing a large-calibre, high-velocity machine-gun firing heavy armour-piercing bullets. This weapon, if fairly mobile, would have been an effective reply to the tank had it been introduced sooner. It was known as the "Tuf" (*Tank und Flieger*), was of 13-mm. calibre and could fire 200 bullets, said to be capable of piercing 30 mm. of hardened steel, a minute. Great efforts were made to produce it quickly and to keep its manufacture secret. Six thousand were to have been ready by April 1919, but by the Armistice none was in the field.

The greatest physical obstacle to the advance of tanks—one form of defence—experienced during the war was mud, and this was intensified by the concentrated and prolonged artillery fire which was generally carried out by both sides. In dry weather this rendered the ground almost impossible to negotiate and in wet weather made it absolutely impassable by any machine moving on the surface of the ground. This was well exemplified during the third battle of Ypres in 1917, when the Germans could not have arranged a better defence against tanks than the morass created in the low-lying battlefield by the British guns. Here the conditions were such as to render futile the employment of tanks which was attempted. The best anti-tank defence beyond this half-natural, half-artificial obstacle, is, as has been said, the fire of suitable, mobile, light Q.F. artillery and carefully disposed minefields. Inundations are likely to be rendered useless by the tank becoming an amphibious machine.

GENERAL CONCLUSIONS

The tank was the one complete British innovation in the war and a great one. The resurrection of an old weapon, it was forced into a fresh existence during hostilities by the needs of the war, and created for a special purpose. In essence it amounted to the addition of bullet-proof plate and armament to an existing agricultural machine which possessed the quality of cross-country mobility. Its immediate purpose was the destruction of the machine-gun—a weapon which, until the tank appeared, was responsible during the war for the loss of more human life than any other, and upon which the Germans at bay, on the defensive, placed so much reliance. With the machine-gun in this connexion is associated the wire obstacle. The combination of the two was the disease for which the tank proved to be the only cure; but, early as the disease was diagnosed, it had grown to be the scourge of the Allies on the western front, whenever they attempted to press forward as demanded by the strategic situation, long before the cure was applied. The tank was the great life-saver of the infantry. To it many thousands of the soldiers of the Allies, principally French and British, owed their lives—infantrymen who but for the tanks would have had to repeat, on a larger scale and possibly abortively, the bloody offensives of 1915, 1916 and the first half of 1917. It took the place of the old stereotyped and expensive artillery preparations, with more certain results, and also reintroduced the surprise factor, which the preliminary bombardment prevented, and which the conditions of trench warfare otherwise rendered impossible without the protection to the infantry afforded by it.

A remarkable feature about the introduction of the British tanks was the fact that they were to a great extent forced on the army by the action of certain enthusiastic individuals, of whom one only was a serving soldier. Some of those, also, who were responsible for the creation of the new weapon, from the beginning formulated the tactics for its employment, which were finally after an inexplicably long period put into practice in the field. This was the case with the British and the French. The British first used tanks in Sept. 1916, and first employed them correctly on a large scale on Nov. 20 1917, 14 months later. The French first used tanks in April 1917, and first employed them correctly, on a large scale, on July 15 1918, also 14 months later. And in each case this happened in spite of the proper method having been put forward, and its adoption urged. The only explanation of this policy is that it was due to inherent conservatism and lack of imagination, incredulity concerning the attributes of the new weapon, failure to understand what they implied, and initially lack of patience.

That the tanks achieved their object was shown by the preparations made by Great Britain, France, the United States, Italy and also Germany for the continuation of the struggle in 1919, and by the fact that their manufacture had begun to take up a large proportion of the munition-producing capacity of three at least of the combatants. In regard to results, it is only necessary to recall one major fact, so far as the British were concerned, *i.e.* that after the era of mechanical warfare, as it has been termed, set in, on Aug. 8 1918, and between that date and the Armistice, 59 British divisions were able to defeat 99 German divisions, a reversal of the proportion usually considered to hold between attackers and defenders. The offensive had at last obtained the superiority; and strength could no longer be estimated by the counting of heads. During the war the German infantry confessed itself impotent against tanks. But since the war not only have the infantry soldiers of other nations come to the same conclusion, but admit that they are often helpless without tanks to assist them. In certain circumstances they demand the assistance of these machines; and they are right. In regard to the influence of the new arm on the result of the war amongst a mass of corroborative evidence, one statement includes and covers all others. On Oct. 2 1918, when the end was fast approaching, the report to the heads of the Reichstag parties made by the representatives of German military headquarters began with the following words[1]:—

> "The Chief Army Command has been compelled to take a terribly grave decision and declare that, according to human possibilities, there is no longer any prospect of forcing peace on the enemy. Above all two facts have been decisive for this issue. First, the Tanks—. . ."

Such an admission, wrung after four years from those who had confidently started the World War, is sufficient.

In regard to the different ways in which tanks established their military value, apart from the actual results achieved, some instructive statistics have been prepared of their action from the aspect of the "economics" of war.[2] In fighting man-power a brigade of 144 tanks has a fire-power equivalent to that of 24 light batteries of six guns each, and nearly 200 more machine-guns than are carried in a division. An infantry division accompanied by one battalion of tanks can attack three times the frontage that can be attacked by a division unaccompanied by tanks. The fighting infantry in three divisions is 21,000 men, of one tank battalion 500. The saving in man-power is therefore 13,500, or 63 %, and with equivalent fire-power the chances of casualties are reduced. As to economy in infantry casualties, the losses on the first day at the battle of Cambrai (a tank battle) were approximately 1,000 per division engaged; at the battle of the Somme (an artillery battle) there were 3,000. Between July and Nov. 1917, when tanks were used on impossible ground 258,000 casualties were sustained by the British; between July and Nov. 1918, when tanks were used on possible

ground, the Germans lost 284,000 prisoners alone. As to economy in artillery personnel, at the third battle of Ypres 121,000 artillery personnel, were used on a front of 17,000 yd., the maximum penetration attained on July 31 (one day) being 3,300 yards. At Cambrai 4,100 tank personnel carried out the work normally done by the guns on a front of 13,000 yards. The maximum penetration attained in one day was 9,500 yards. As to economy in cavalry personnel, the personnel of all ranks in a cavalry division (without the Royal Horse Artillery) would suffice to man and equip three brigades of Whippet tanks or 540 machines. As to economy in ammunition, at the battle of Arras, on a front of 17,000 yd., 2,007,534 shells, weighing 57,000 tons, were fired; at the third battle of Ypres, on the same frontage, 3,107,363 shells, weighing 93,463 tons, were fired. At Cambrai, on a 13,000 yd. front, 293,149 shells, weighing 5,824 tons, were expended. It is shown that the use of tanks also leads to economy in munition manufacturing man-power, in shipping and land transport, in weight carried by the soldier, in labour on the battlefields, in property damaged, in forage or food, in time and in cost of production. In regard to the latter item the cost of projectiles and explosives alone for 1918 was £329,860,344 and for the undeveloped new arm, tanks, £9,587,960. This inevitably leads to speculation as to what results might have been had Mr. de Mole's suggestion made in 1912 been taken up and developed, even at the cost of 12 hours' conduct of the war in 1918.

The principle of mechanical warfare and the advantage of using power-driven machines instead of human and animal muscle having been established in one particular direction, there is little doubt but that it will be applied in others. In future, there will be larger and smaller fighting tanks developed from those born in the World War. They will be speedier, more powerful and have a far longer range of action. Some will also be amphibious, and all will be less easy to stop than the present somewhat embryonic machines. The principle of track propulsion will be applied to vehicles of all types and not confined to fighting machines, and will to a great extent eliminate the necessity of using roads or railway, and place the movement of armies on a "two-dimensional" basis instead of being on a one-dimensional basis as it has in the past. Future fighting tanks will in certain theatres be able to replace cavalry and may against a civilized enemy be able to carry out, with aeroplanes, those long-distance raids against H.Q. and important points far behind the fighting-line, which since the advent of the machine-gun cavalry cannot execute, will give greater facility both for the release of gas in large quantities, if gas is used, and also for obtaining protection against gas. The fighting machines will be very largely used in conjunction with action in the air, and the two services will be complementary and mutually helpful. Large tracts of roadless country which have to be held against an uncivilized enemy, or a hostile population, will provide the first opportunities for the development of this combination, on account of the saving that will be effected in men and animals, the most expensive and delicate parts in an armed force. In killing-power, mobility, and endurance, one efficient mobile machine with its crew and machine-guns will be able to take the place of many infantry or cavalry soldiers and many horses, and will cost less to maintain and feed. In the United States the possibility of the "motorization" of all war transport and of eliminating the horse was in 1921 being fully discussed, and if the signs are read correctly this will be the general tendency, so that the great wars on land of the future will be practically horseless and conducted by far fewer men in the field and more men in the factory and workshop than has been the case in the past. Strength for war will not in the future be estimated by counting heads, for, beyond the minimum necessary, the greater the number of human beings in a force in the field the greater will be its vulnerability. The introduction of the tank in 1916 upset all the existing values of field defences, and its natural and inevitable evolution will cause a revolution in the methods of war as great as that in tactics caused by its original appearance.

In the compilation of this article reference has been made to the following works:—Clough William-Ellis and A. William-Ellis, *The Tank Corps* (1919); J. F. C. Fuller, *Tanks in the Great War* (1920); D. G. Browne, *The Tank in Action* (1920); Dutil, *Les Chars d'Assaut, leur création et leur rôle pendant la guerre, 1915–1918* (1919); M. Schwarte, *Die Militärischen lehren des Grossen Krieges* (1920).

TANNENBERG, a village of East Prussia, 10 m. S.W. of Hohenstein. It has given its name to two battles of great importance in German history, the battle of July 15 1410, in which the Poles and Lithuanians destroyed the forces of the Teutonic Order (*see* 21.905), and that of Aug. 26–31 1914, in which the German VIII. Army under General-Oberst von Hindenburg destroyed the Russian II. Army commanded by General Samsonov. The latter is described in detail under the heading MASURIA, BATTLES IN. For a critical account of the former, the story of which has been overlaid by a mass of legends, see Delbrück, *Gesch. der Kriegskunst*, vol. iii., book iv., ch. 6.

TARKINGTON, [NEWTON] BOOTH (1869–   ), American writer, was born in Indianapolis, Ind., July 29 1869. After studying at Phillips Academy, Exeter, Mass., he entered Purdue University, Lafayette, Ind., but two years later transferred to Princeton, where he graduated in 1893. At first he intended to follow a business career, but after a few years devoted his time to writing. He was elected to the Indiana House of Representatives for the term 1902–3. In 1918 he received the degree of Litt.D. from Princeton. In 1920 he was elected to the American Academy of Arts and Letters. The same year he was engaged as a writer of photo-plays by the Goldwyn Pictures Corporation. His first story, *The Gentleman from Indiana*, was published in 1899, having appeared already as a serial in *McClure's Magazine*. In 1900 his reputation was established by *Monsieur Beaucaire*, which he successfully dramatized (with E. G. Sutherland) in 1901. In 1919 he was awarded the Pulitzer Prize by Columbia University for his novel, *The Magnificent Ambersons* (1918).

His other stories include *The Two Vanrevels* (1902); *Cherry* (1903); *The Conquest of Canaan* (1905); *Guest of Quesnay* (1908); *Beauty and the Jacobin: an Interlude of the French Revolution* (1912); *Penrod* (1914); *Penrod and Sam* (1916); *Ramsey Milholland* (1919); *Alice Adams* (1921). His plays include *Cameo Kirby* (1907); *Your Humble Servant* (1908); *Mister Antonio* (1916); *The Country Cousin* (1917, with Julian Street); *The Gibson Upright* and *Up From Nowhere* (1919, both with Harry Leon Wilson); *Clarence* (1919).

TATA, SIR RATAN (1871–1918), Parsee financier and philanthropist, was born at Bombay Jan. 20 1871, the son of the famous Parsee merchant Jamsetji Nasarwanji Tata (*see* 26.448). He was educated at St. Xavier's College, Bombay, and afterwards entered his father's firm. On the death of the elder Tata in 1904, Ratan Tata and his brother Dorabji Jamsetji Tata (b. 1859) inherited a very large fortune, much of which they devoted to philanthropic works of a practical nature and to the establishment of various industrial enterprises for developing the resources of India. An Indian institute of scientific and medical research was founded at Mysore in 1905, and in 1912 the Tata Iron and Steel Co. began work at Sachi, in the Central Provinces, with marked success. The most important of the Tata enterprises, however, was the storing of the water-power of the Western Ghats (1915), which provided the city of Bombay with an enormous amount of electrical power, and hence vastly increased the productive capacity of the Bombay industries. Sir Ratan Tata, who was knighted in 1916, did not confine his benefactions to India. In England, where he had a permanent residence at York House, Twickenham, he founded (1912) the Ratan Tata department of social science and administration at the London School of Economics, and in 1912 established a Ratan Tata fund at the university of London for studying the conditions of the poorer classes. He died at St. Ives, Cornwall, Sept. 5 1918.

TAUSSIG, FRANK WILLIAM (1859–   ), American economist (*see* 26.456), was during 1917–9 chairman of the U.S. Tariff Commission, which made a special study of commercial treaties and prepared much material for the American Peace Commission in Paris. In March 1919 he was called to Paris to advise in the adjustment of commercial treaties, and in Nov., on invitation of President Wilson, attended the second industrial conference in Washington for promoting peace between capital and labour. He was a strong supporter of the Covenant of the League of Nations. He was the author of *Principles of Economics* (1911; 2nd ed. 1915); *Some Phases of the Tariff Question* (1915); *Investors and Money-Makers* (1915); and *Free Trade, the Tariff, and Reciprocity* (1919).

TEISSERENC DE BORT, LÉON PHILIPPE (1855–1913), French meteorologist, was born in Paris Nov. 5 1855, the son of an engineer. He began his scientific career in 1880, when he entered the meteorological department of the Bureau Central Météorologique in Paris under E. E. W. Mascart. In 1883, 1885 and 1887 he made journeys to N. Africa to study geology and terrestrial magnetism, and during this period published some important charts of the distribution of pressure at a height of 4,000 metres. In 1892 he became chief meteorologist to the Bureau, but resigned in 1896 and founded a private meteorological observatory at Trappes, near Versailles, where he carried out investigations on clouds and the problems of the upper air. In 1898 he published an important paper in *Comptes Rendus* detailing his researches by means of balloons into the constitution of the atmosphere. His discovery of the so-called isothermal layer, or stratosphere as it is now generally called, will always stand out as one of the most important events in the study of the upper atmosphere. He also carried out investigations in Sweden and over the Zuider Zee, the Mediterranean and the tropical region of the Atlantic, and fitted out a special vessel in order to study the currents above the trade-winds. He was elected a fellow of the Royal Meteorological Society in 1903, hon. member in 1909, and was awarded the Symons gold medal of the society in 1908. He collaborated with Hugo Hildebrandsson in *Les bases de la météorologie dynamique* (1907). He died at Cannes Jan. 2 1913.

TELEGRAPH (*see* 26.510*).—Apart from the advances in Wireless Telegraphy (*see* WIRELESS) and Cable Telegraphy (*see* SUBMARINE CABLE TELEGRAPHY), progress since 1910 has been seen in various technical directions. The developments in the United Kingdom and in the United States in some respects have differed, and this article therefore considers them in two sections which differentiate not only certain technical and commercial aspects of the subject but also certain distinctive points of view.

UNITED KINGDOM

One of the most important developments in type-printing telegraphy is the adaptation of the Baudot for duplex working by A. C. Booth in 1905. This forms the basis of all modern multiplex systems, and has led to a great increase in the output and flexibility of such systems with a consequent considerable extension of their use.

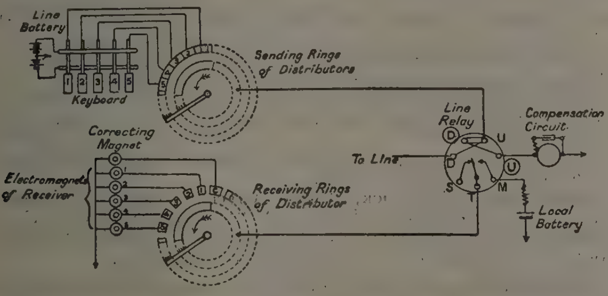

FIG. 1.

Booth-Baudot.—The underlying principle of the Booth-Baudot will be understood by reference to fig. 1. It will be seen that the outgoing signals from the sending rings of the distributor at the home station divide differentially at the line relay and therefore do not affect the receiving apparatus which is connected in the local circuit, via the receiving rings of the distributor. Installations of double, triple, quadruple, quintuple, and sextuple duplex have given excellent results in the British Post Office service during a number of years. The method of driving the mechanism of the Baudot distributors and receivers has been changed from weight driven gear, to electric motor drive. In the case of the receivers, a small series motor with belt drive is used, while the distributors are driven by the La Cour phonic motor. In both cases a considerable saving is obtained in first cost and maintenance expenses with the advantages of more satisfactory working and greater facility in changing apparatus when necessary.

The Carpentier method of automatic transmission on Baudot circuits has recently been reintroduced in the British Post Office, but with several important improvements.

In offices where a large number of keyboard perforators are used, each having its own particular lay-out, the change from one instrument to another caused serious difficulty from an operating standpoint. This difficulty was much felt with the original Carpentier keyboard, in which, owing to the exigencies of the Baudot code, the keys for the numerals were spread over the keyboard instead of being arranged on the first row of letter keys as in most typewriters. Carpentier sought to minimize this difficulty by adding an extra row of keys for the numerals, and a similar arrangement was adopted in the Morse keyboard perforators such as the Gell and the Kleinschmidt.

Messrs. A. C. Booth and A. S. Willmott have now invented a device which enables the keyboard for any type of machine telegraph, whatever the code used, to be arranged exactly as in a typewriter, thus allowing the numerals to be placed in their standard positions without the extra row of keys.

The Booth-Willmott-Baudot keyboard perforator punches the 5-unit code transversely on a paper tape which is of the same size as that used in the Murray and Western Electric instrument (see hereafter), enabling the transmitters of either of these installations to be used in conjunction with it. Switches are provided on the instrument tables so that any particular arm of the multiplex may be worked automatically from a transmitter fed by a Booth-Willmott perforator or by direct-sending from an ordinary Baudot keyboard sender at will.

Lakey, "Progress of Baudot Duplex," *I.P.O.E.E. Journal* (vol. xii., p. 216); *Post Office Technical Pamphlet for Workmen, B6.*

Murray Multiplex.—The difficulty experienced by Baudot operators in manipulating accurately the direct-sending keyboards in time with the cadence signal at speeds much in excess of 30 words per minute led Murray to adopt the Carpentier method of automatic transmission in his multiplex system. The main features of the Booth-Baudot system are utilized, but the operators perform on perforators which have keyboards similar to that of an ordinary typewriter and do not have to keep in time with a cadence signal. Each key of the perforator, when depressed, perforates in a paper tape, a particular combination of holes in accordance with the arrangement of the five-unit code adopted by Murray. The tape thus prepared has its perforations across the slip and not longitudinally as in the case of the Murray automatic system, the use of which has been abandoned, so that a great saving in the cost of paper results.

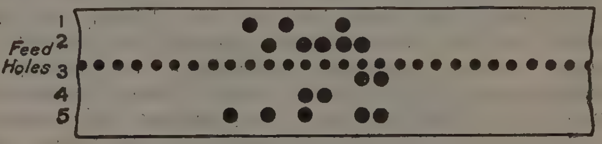

FIG. 2.

Fig. 2 shows a portion of the Murray multiplex transmitting tape perforated to represent the word "telegraph." From the perforator, the tape passes directly into an automatic transmitter, which has five selecting needles, each controlling a contact lever resting

---

* *These figures indicate the volume and page number of the previous article.*

normally against a bus-bar connected to the spacing pole of the line battery. When a needle passes into a hole in the tape the corresponding contact lever moves over and makes contact with a bus-bar connected to the marking pole of the line battery. The positions of the contact levers are therefore determined by the perforations in the tape and as each lever is connected to its own particular segment on the sending ring of the distributor, the signals representing a character are sent out to line, one after the other, as the brushes pass over the segments. Immediately the brushes have passed over the last of the segments allocated to a particular transmitter a current impulse is sent from another ring of the distributor through a "cadence" electromagnet in the transmitter, which when operated withdraws the selecting needles that have entered perforations and propels the tape forward sufficiently to bring the next group of perforations into position above the selecting needles. Provision is made for preventing mutilation of the paper tape when the transmitter overtakes the perforator, by arranging for the tightening of the tape to actuate a lever situated between the two instruments. When the lever is pulled down the armature of the cadence electromagnet is prevented from moving. As soon as the tape slackens the lever rises and transmission is continued. For the reception of signals Page printers are employed somewhat similar to those which were used in the Murray automatic system, but differing from them in that the five selecting combs, which determine the letter to be printed, are positioned by electromagnets instead of by a perforated tape. The normal speed of working of each arm of the Murray multiplex is 40 words per minute, although speeds in excess of this may be attained.

The Western Electric Multiplex.—This system is also based on the Booth-Baudot duplex and came into use in 1914. The adoption of a method of correction from the actual working signals themselves, instead of utilizing special correcting signals as in the Baudot and Murray systems, results in a saving of line time and therefore gives a greater output on difficult lines.

The transmitters and perforators are the modern developments of Carpentier's but the printer used types the message in page form instead of on a paper tape as in the Baudot system, from a type wheel which rotates from character to character as may be required. This printer has not given entirely satisfactory results, and is being superseded by one in which type bars are used in place of a type drum and the paper is kept central instead of being moved sidewise to and fro. The phonic wheel distributors are driven by electrically vibrated tuning-forks, which possess an advantage over vibrating-reeds in that they may be placed on the instrument table instead of being fixed to a steady support as is required in the case of reeds.

The Kleinschmidt Electric Co. of New York have recently designed a very compact column printer which may be used on Western Electric multiplex circuits. As in the Murray printer, there are five selecting combs which are operated by electromagnets. When the combs have been positioned, during the reception of a character, certain slots in the combs are thereby brought into alignment allowing a pull-bar attached to one extremity of the required type-bar lever to fall into them. Directly after the combs have been moved and the type-bar lever selected, a contact is closed mechanically, completing a circuit through a printing magnet which, when it operates, causes the selected pull-bar to be impelled forward, thus projecting the free end of the corresponding type-bar lever against an ink ribbon and printing the required character as in a typewriter.

The Siemens Automatic System.—The original Siemens automatic system used an 11-unit code actuating a receiver which printed the incoming signals in Roman characters on photographic paper. The preparations required for the received slips, which had to be developed chemically, impaired its usefulness for actual traffic, and the system was superseded in 1912 by one using a 5-unit code and a revolving type-wheel. The latter is now extensively used in Germany and to a limited extent in other countries.

As in the case of the Creed and other automatic systems there are several perforating operators and one transmitting operator at the sending station. The prepared tape from the keyboard perforators is passed through the transmitter over five selecting needles, controlling their upward movement and determining the polarity of the current impulses sent to line during each revolution of a brush over the five segments of a distributor. The sending distributor brush arm is driven by a shunt wound motor whose speed is kept steady by means of a heavy flywheel mounted on the spindle. Unison with the brush arm of the receiving distributor at the distant station is maintained by the actual working signals. The receiving and translating arrangements of the receiver are almost entirely electrical, and printing is effected by the discharge of a condenser through an electromagnet, the armature of which presses momentarily a paper tape against a revolving type-wheel. This tape is afterwards pasted on ordinary message forms as in the Baudot system. In addition to the printing tape, the incoming signals can also actuate a keyboard perforator to provide a perforated tape for retransmission purposes. The system may be worked either simplex or duplex and is capable of giving a maximum speed of 166 words per minute in each direction.

The Morkrum Teletype.—This is a single-line system of printing telegraphy which has been recently developed by the Morkrum Co. of Chicago, U.S.A. It may be duplexed, and is suitable for short lines over which the traffic is not very heavy.

The apparatus comprises two units, a keyboard transmitter, and a printer, which are mounted on one base to form a very compact combined sending and receiving instrument. The keyboard is arranged as for a standard typewriter, and is a direct-sending instrument the keys of which when operated allow a camshaft to revolve opening and closing the line circuit according to the 5-unit code. Starting and stopping impulses are sent over the line to start and stop the selecting mechanism of the printer so that from transmission point of view the system has actually a 7-unit code. A feature of the system is the controlling and selecting mechanism of the printer, which is an ingenious combination of the Hughes and Baudot printers. The received message is printed on tape in exactly the same way as in the Baudot printer and afterwards gummed on ordinary message forms.

The maximum speed of operation of the keyboard is limited to 45 words per minute and a device is provided which is actuated when this speed is exceeded and prevents the keys being depressed too rapidly.

The Creed System.—One of the principal drawbacks to the original Creed system was the use of compressed air for working the apparatus, which in a large number of offices necessitated the installation of a special pneumatic plant. Moreover, the pneumatic Creed printer had a maximum speed of only 120 words per minute, so that on lines where the working speed was much in excess of this figure it was necessary to install two printers in order to deal expeditiously with the traffic. The latest Creed instruments, however, have been designed to work electrically; they are much simpler in their construction and give speeds up to 200 words per minute.

For the preparation of the transmitting tapes, Gell and Kleinschmidt perforators are generally used, each of which has a keyboard similar to that of an ordinary typewriter. The depression of a key selects, through a system of levers, the punches required to perforate the holes in the tape for the corresponding signal, and closes a circuit through an electromagnet, the armature of which forces the selected punches through the paper tape. As these perforators prepare Wheatstone slip their mechanism is necessarily much more complicated than that of keyboard perforators designed for a 5-unit code, in which all letters are of the same length, because in the former a differential feed varying from two-tenths of an inch to over one inch is required owing to the varying length of the letters. These machines will work as fast as a typewriter, but 80 words per minute is regarded as the limit for practical purposes.

Gulstad Relay.—In 1898 Gulstad of Copenhagen invented a modified form of polarized relay, known as a vibrating relay, the use of which has enabled much greater speeds of working to be attained on underground and submarine circuits, and in some cases allowed repeaters to be dispensed with. In general construction it is similar to the British Post Office standard relay, but, in addition to the usual line coils, has two extra windings on the same cores. These windings are connected to a local battery in such a manner that the relay tongue is caused to vibrate between the contact points, when the current through the line coils is insufficient to maintain it on either of the contacts.

The principle of the relay may be understood by referring to fig. 3. It will be seen that the ends of the local windings are joined to terminals B and C and their centre to terminal A, which is joined through an adjustable resistance Y to the relay tongue. This resistance is for regulating the local current and keeping it below the value of the steady current through the line coils. Terminal B is connected to earth through a condenser K, while C has a resistance coil X in its earth lead.

Assuming that there is no current in the line coils and that the relay tongue has just reached the marking contact, there will then be a momentary rush of current through the winding AB to charge the condenser K, in a direction to keep the tongue to the marking side, thus preventing any tendency of the tongue to rebound. This charging current dies away rapidly, however, and directly its strength falls below the steady current flowing through the winding AC, the preponderance of the latter causes the tongue to move toward the spacing contact. Immediately the tongue leaves the marking contact, the condenser K discharges through both windings BA and AC in such a direction as to accelerate the movement of the tongue, so that its transit time from one contact to the other is thereby lessened.

When the tongue reaches the opposite contact the condenser K is again charged, but this time from the other pole of the battery; a similar cycle of effects therefore takes place on that side and the tongue moves in the reverse direction. In this manner the relay tongue is kept vibrating, at a speed depending on the values given to the condenser and resistance. In practice the adjustments are such that the rate of vibration of the tongue under the control of the local current is approximately equal to the rate at which the transmitter at the distant station sends reversals at working speed. When this obtains, the signals passing through the line coils merely determine the length of time that the tongue remains in contact with either stop, its movement therefrom being effected by the local current through the local windings as soon as the strength of the line current falls below that of the local current in the coil AC. It is this effect combined with the action of the condenser in lessening the time of transit of the tongue, that enables a higher speed of working to be attained on long and difficult circuits than if ordinary polarized relays were used.

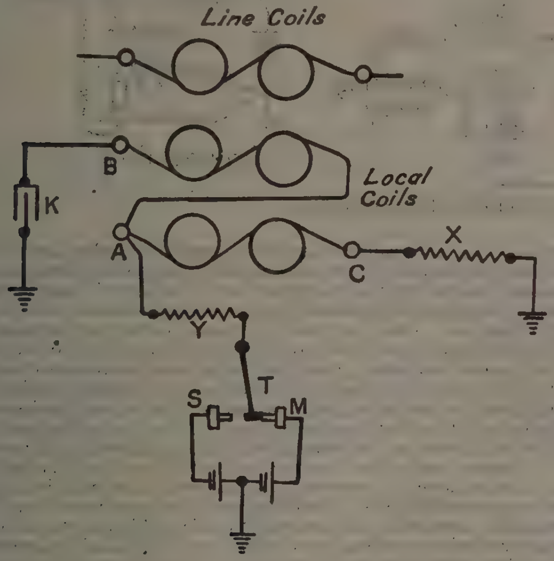

FIG. 3.

In the original Gulstad relay the line coils were not differentially wound; it could be used, therefore, only on Bridge duplex or simplex circuits. To utilize the advantages of the Gulstad principal on differential duplex circuits, the British Post Office has modified the Post Office standard relay, by adding extra windings and terminals. This modified instrument is known as a "G" relay and is equally suitable for differential or bridge duplex working. The internal and external connexions of this relay are shown in fig. 4, in which the dotted lines indicate the extra coils. For the correct reception of the incoming signals a Wheatstone receiver is connected to the relay tongue.

REFERENCES.—E. Lack, "The Gulstad Relay," *I.P.O.E.E. Journal* (vol. vii., p. 183); *Electrical Review* (June 1898 and Aug. 1902); *Herberts Telegraphy* (latest ed.); E. Lack, "Post Office Standard Relay 'G'," *I.P.O.E.E. Journal* (vol. x., p. 34).

Tele-photographic Systems.—In 1909 T. Thorne Baker read a paper before the Royal Institution in London describing his "telectrograph" process of transmitting pictures over long distances. The method, which was used on a large scale by the *Daily Mirror* between London and Paris, is based upon the Bakewell copying telegraph.

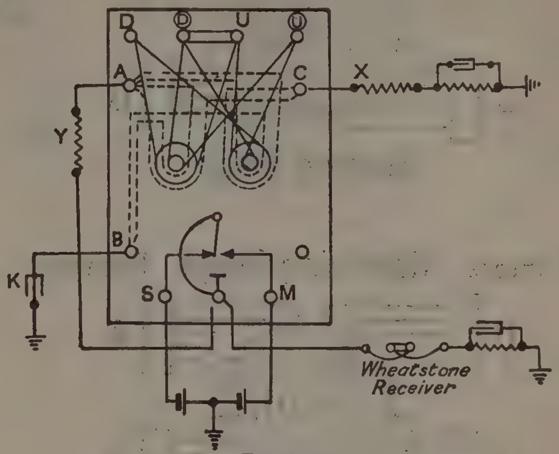

FIG. 4.

Synchronously rotating metallic drums, driven by electric motors, are employed one at each end of the telegraph line over which it is desired to transmit, say, a picture. A half-tone photograph of the picture is first printed upon thin sheet lead and subjected to a process which breaks up the photograph into a number of dotted lines printed in fish glue. This record is fixed round the transmitting drum, which is traversed spirally by an iridium stylus. The contact of the latter with the lead is interrupted every time one of the fish glue dotted lines comes beneath it, for duration depending upon the width of the line. The lead sheet is connected to the line, so that the transmitting instrument sends a series of electric currents whose periods of duration are determined by the width of the lines composing the photograph. At the receiving station, the rotating drum carries a piece of absorbent paper impregnated with a colourless solution, which turns black or brown when decomposed by an electric current. Every brief current through the paper causes a mark to appear, having a width depending on the duration of the current. The arriving currents are therefore arranged to pass through a platinum stylus under which the receiving drum rotates, then through the moistened paper resulting in the production of a number of marks on the paper due to chemical decomposition. These marks gradually combine to produce the picture at the transmitting station.

REFERENCES.—T. Thorne Baker, "Telegraphy of Photographs, Wireless and by Wire," *Royal Institution Proc.* 1908–10, vol. xix.

Foss and Petersen Method.—In this system a high frequency generator capable of producing sparks is used at the receiving station. The sparks so produced are capable of puncturing a paper wrapped round a metal drum which rotates in unison with a similar drum at the sending station.

The line wire is arranged so that when the sending end is connected to earth the generator is partly short-circuited, thus suppressing the sparking. At the sending end the shunting of the generator is effected by means of a contact pin passing over a cylinder on which the writing or illustrations are inscribed in insulating ink so that the shunt circuit is cut out each time the pin passes part of the writing (see Patent Specification No. 105,914, 1917). (W. No.)

UNITED STATES

Technical developments made after 1910 practically revolutionized telegraphy as practised in the United States. These include printing-telegraph arrangements applied to telephone as well as to telegraph circuits, simultaneous telephone and telegraph operation for long small-gauge cable circuits, and the use of alternating currents with resonant circuits in the so-called carrier systems for multiplexing wire conductors.

Radical changes were also made in the arrangements for and the methods of handling telegrams in large offices. Belt conveyers, typewriters, pneumatic tubes, automatic time-stamps and other labour-saving devices came to be used to a large extent. About 75% of all telegrams handled by the Western Union Telegraph Co. over trunk circuits in 1921 were transmitted and

received by printing-telegraph apparatus. The introduction of machine telegraphy took place after 1910.

Progress can be divided into two general classes: (1) that relating to terminal equipment, such as printers; and (2) that relating to the methods of working lines.

Printing Telegraphy

(*a*) *Multiplex System.*—The multiplex system giving double-duplex, triple-duplex and quadruple-duplex service, as applied in America, was that developed jointly by the Western Electric Co. and the Western Union Telegraph Co. It uses the Baudot code and a system of speed correction for rotating distributors in which correcting impulses are generated from the character signals, thus saving line time.

The fundamental features of one arrangement for quadruple-duplex operation are shown in fig. 5. The sending, receiving and correcting rings are parts of a distributor driven by a La Cour or phonic-wheel motor. The common sending ring is connected to the midpoint of a differentially wound line relay and the common receiving ring to the armature of a printing relay included in the local circuit of the line relay. This local circuit also includes an impulse relay, so arranged that short-current impulses are sent to the common ring of the set of correcting rings when the line relay armature moves from one contact to the other. These impulses come at intervals determined by the signals transmitted by the distant station. There are twice as many correcting segments as sending segments, and these are alternately connected to the windings of a correcting relay. One distributor on a circuit sets the speed for the other and if the corrected distributor is running too fast, the operation of the correcting relay causes the driving fork for its motor to be retarded in its rate of vibration. If, on the other hand, the distributor is running too slowly, the fork is accelerated. It is essential to secure correcting impulses when all printing channels are idle. This is done by reversing the polarity of the marking signals of one or more channels. Various types of printer units have been successfully used with this system. Speeds as high as 50 to 60 six-character words per minute per channel are maintained by operators. The multiplex printer system has thus greatly increased operators' loads as well as the number of telegraph channels which can be obtained from each line circuit. Means have been developed for economically extending the single channels of a multiplex-printer system from the multiplex terminal station to branch offices.

have been developed for inter-communicating purposes among a group of stations. These systems have been used to a considerable extent with telegraph circuits obtained from telephone circuits.

One of these systems employing motor-driven distributors at each station is shown in fig. 6. The sending distributor at one station and the receiving distributor at the other are indicated in detail. The distributor brush arms driven through a friction clutch are normally held stationary by a latch and make one rotation for each character transmitted or received. A start impulse, usually the opening of the line circuit for a brief interval, releases the receiving start latches so that all receiving distributors start rotating. The five impulses of the Baudot code which follow the start impulse are distributed properly to the selecting magnets or elements of a printer by the receiving distributors if their speeds coincide approximately with that of the sending distributor. Close synchronism is not required since all distributors are stopped and caused to start from the same initial position for each character.

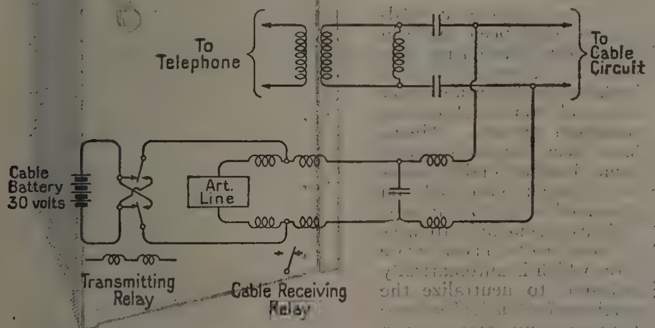

FIG. 8.—Terminal Arrangement for Metallic Telegraph Cable Circuit.

An important feature is the method by which any receiving station can interrupt the sending station and obtain control of the circuit. As shown, this is accomplished if the line circuit is interrupted by the break key during the time the sending brush is passing over the sixth segment when a break relay at the sending station will be energized to open the circuit of the magnet controlling the latch. The release key will then have to be operated to permit further sending. This printing system has been used to a considerable extent for news distribution, where in many cases a number of sending and receiving stations are connected to one circuit and means must be provided to allow any station to obtain control of the circuit. Keyboard arrangements which may be used for perforating tape or for sending directly to the line have been developed and found very satisfactory for this kind of service. The Western Electric type-bar printer has been found very satisfactory for news service. This is provided with a stationary paper platen and a moving type-bar basket. Books containing carbon paper for making a large number of copies and forms holding wax stencil sheets may be readily inserted into the machine. Means are provided for adjusting the strength of the blow of the type bars so that one to twenty copies can be secured.

(c) *Cipher Printing System.*—A printing system for rapidly ciphering and deciphering telegraph messages has been developed. It is thought that cipher messages prepared by this system are absolutely unbreakable. It was successfully applied by the U.S. Army Signal Corps during the war and tests made indicate that messages can be ciphered and deciphered by this means with greater accuracy and many times faster than by other methods.

This system was developed by the engineers of the American Telephone and Telegraph Company. Its principles are illustrated in fig. 7. A message prepared in perforated tape form by the ordinary printer perforator passes through transmitter A. This would ordinarily control the selecting magnets of a printer or an automatic perforator. Key tapes B and C, however, passing through ordinary tape transmitters, control relays which interfere with the normal operation of the selecting magnets so that the resultant selection for any character of the message may be any one of the characters of the Baudot code. The characters of the key tapes are selected at random and B is one unit less in length than C. All tapes are stepped in unison. Repetition in the resultant key will not occur until B has revolved 1,000 times. The proper starting position of the key tapes B and C for any message may be indicated by six characters which may be

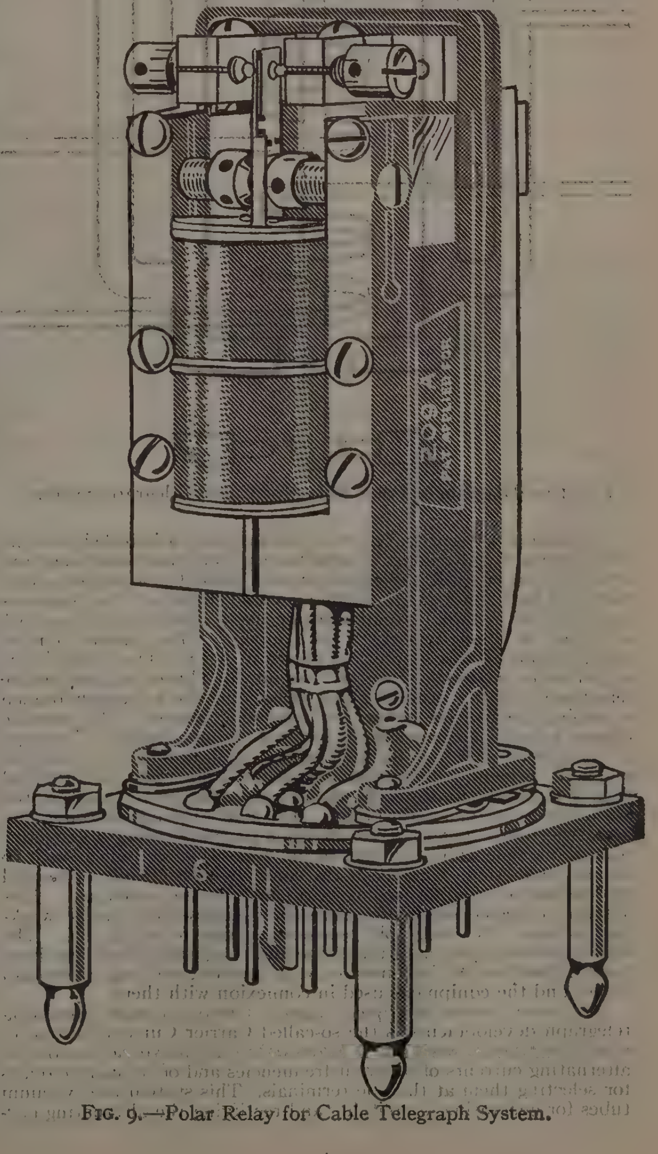

FIG. 9.—Polar Relay for Cable Telegraph System.

ciphered by an additional key. In deciphering the cipher message tape is placed in transmitter A and the characters combined with the proper key to obtain the original message.

Methods of Working Lines

(*a*) *Simultaneous Telephone and Telegraph Working.*—Considerable advance has been made in the technical knowledge of simultaneous telephone and telegraph operation of line circuits. Hand telegraph systems and single-channel printer systems usually operate at dot speeds of 10 to 25 per second and it has been found that in order to secure satisfactory service it is necessary to design line systems to transmit a frequency band of about 100 cycles per second. Since telephone frequencies range from about 250 to about 2,500 cycles per second, it is possible to secure satisfactory telegraph operation from telephone circuits by using frequencies below the lowest telephone frequencies and frequencies above highest telephone frequencies. More than 600,000 m. of telegraph circuits are obtained from telephone circuits in the United States.

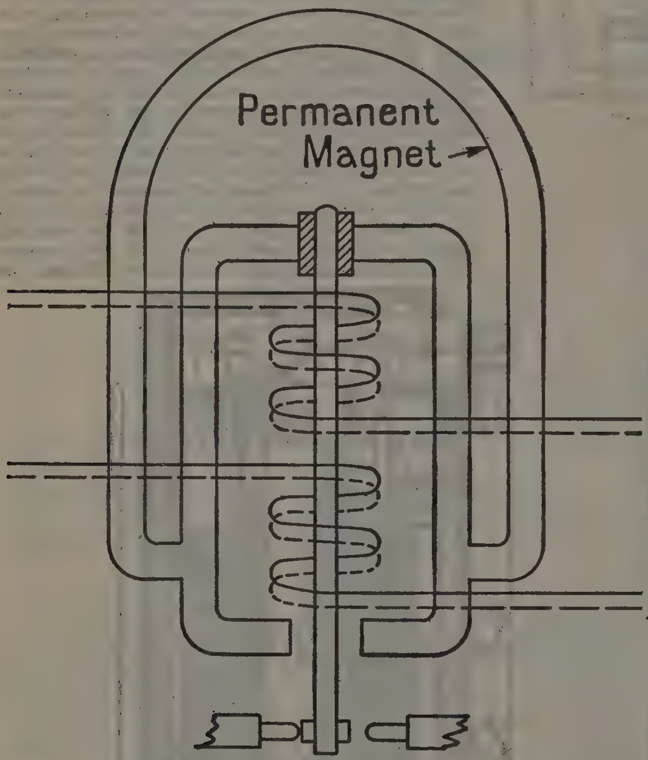

FIG. 10.—Diagram of Polar Relay for Cable Telegraph System.

(*b*) *Metallic Telegraph System.*—The increase in knowledge of the fundamental requirements of simultaneous telephone and telegraph operation has enabled a telegraph system to be developed for operation over long small-gauge telephone cable circuits. This system is arranged for metallic circuit working using a relay operating with a current of approximately 2 milliampères. The general circuit arrangements of this system are shown in fig. 8. The cable circuit is divided by a composite set or filter into two branches, one for the telephone and the other for the telegraph, the telegraph branch absorbing frequencies below the telephone interval. All metallic lines in a single office are supplied from a common battery. The type of polar relay selected for this circuit is shown in fig. 9 and the magnetic principle illustrated in fig. 10. The relay is provided with a Gulstad vibrating circuit and the armature, a reed, is the cross piece of a magnetic bridge. The line windings surround the armature, and a current in one direction causes the armature to move toward one pole while a current in the opposite direction causes it to reverse its motion. Chatter at the contacts is practically prevented by cushioning contact springs attached to the armature. This system has been designed for cables containing as many as 300 working circuits. A telegraph repeater is shown in fig. 11. The simultaneous operation of telephone and telegraph circuits has been carefully worked out in connexion with the design of long interurban cables and the equipment used in connexion with them.

(*c*) *Carrier Current Multiplex System.*—One of the most interesting telegraph developments is the so-called Carrier Current System in which multiplex operation is secured by the use of a number of alternating currents of different frequencies and of resonant circuits for selecting them at the line terminals. This system uses vacuum tubes for generating, amplifying and rectifying the alternating currents and represents a radical departure in telegraphy. The circuits are of high signal quality, very stable in operation and free from the duplex balance difficulties of direct current systems. This system has enabled the following communication facilities to be obtained commercially from a single pair of open wires: Twenty 1-way carrier channels; four 1-way direct current channels; and one and one-half telephone circuits including the phantom. The carrier telegraph circuit is illustrated in fig. 12. The terminal apparatus for one 2-way channel, which repeats between the carrier circuit and the direct current extension circuit, is mounted upon a vertical panel similar in appearance to that of the metallic telegraph system. The same sensitive relays are used in both systems.

(*d*) *Rotary Repeaters.*—Success has been obtained with the use of rotary repeaters in connexion with telegraph circuits operated by the multiplex printer system. This type of repeater restores distorted line signals to their original form and has enabled printer circuits 3,000 m. in length to be operated successfully at high speeds.

(*e*) *Fundamental Telegraph-Transmission Research.*—Considerable attention has been given to the telegraph-transmission problem and improvements have been made in the methods and means for measuring distortion of telegraph signals. The fundamental transmission requirements for different classes of service have been more carefully enumerated and advances made in the design of artificial lines.

(*f*) *Interference.*—Advances have been made in minimizing interfering currents in telegraph circuits both from high-tension power lines and from neighbouring telegraph circuits. Means have been devised to overcome the effect of differences in ground potentials on grounded telegraph circuits. This arrangement introduces a counter-electromotive force which is automatically adjusted to neutralize the earth-potential difference between any two given points.

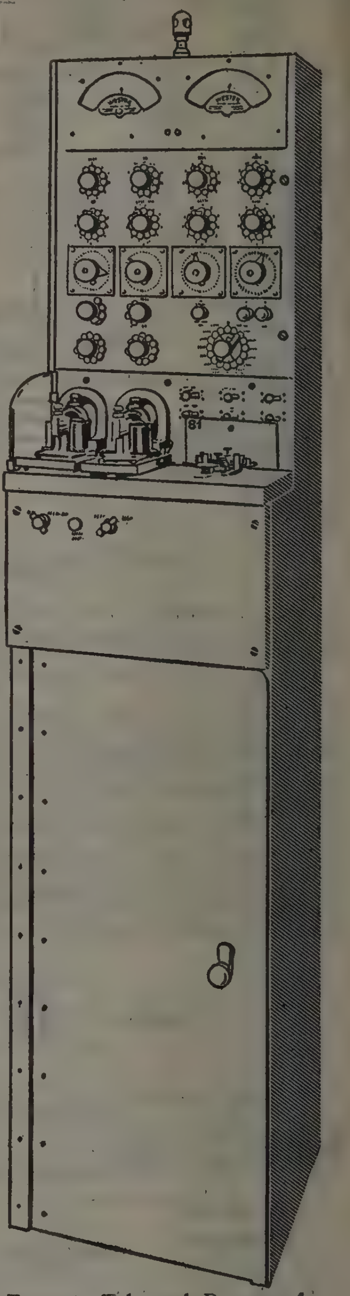

FIG. 11.—Telegraph Repeater for Cable System.

(*g*) *Codes and Sending Machines.*—Codes, abbreviations, typewriters and automatic sending machines are now widely used by operators to increase the capacity of manually-operated telegraph circuits. The automatic machine is merely a vibrating reed mounted in a convenient and portable manner, adjusted to vibrate at telegraph speeds and provided with contacts for controlling the telegraph circuit. A movement of the controlling lever in one direction causes the instrument to transmit a succession of dots, the number depending on the length of time the lever is thus held. A contrary movement sends a dash. This instrument permits higher speeds than are otherwise possible to be maintained with considerably less fatigue on the part of the operator. It may be readily connected with any ordinary telegraph circuit.

Codes and abbreviations for shortening messages are used especially in distributing news. The Phillips Code is one that has been generally adopted and an illustration of its use follows:—

MILES OF TELEGRAPH WIRE OF THE WORLD—JANUARY 1 1910, 1914 AND 1920

(Some of the figures—for the most part those for small places not shown separately—are necessarily in part estimated.)

	SINGLE WIRE		
	Jan. 1 1910	Jan. 1 1914	Jan. 1 1920
Great Britain	311,942	313,166	318,759
Denmark	8,048	8,191	8,500
France	379,888	381,000	715,468
Germany	388,412	459,811	486,714
Italy	126,505	129,500	208,210
Norway	13,120	13,211	16,195
Sweden	40,171	42,194	53,300
Switzerland	16,336	16,476	19,085
Other countries in Europe	826,730	929,072	930,000
Total Europe	2,111,152	2,292,621	2,756,231
Japan	97,300	106,946	127,000
Other countries in Asia	399,030	436,763	553,000
Total Asia	496,330	543,709	680,000
Union of South Africa	46,853	54,201	49,432
Other countries in Africa	110,000	122,159	140,000
Total Africa	156,853	176,360	189,432
United States	1,480,000	1,615,000	1,700,000
Canada	153,000	193,277	214,629
Other countries in North America	78,000	86,805	95,000
Total North America	1,711,000	1,895,082	2,009,629
Total South America	143,590	251,990	333,632
Australia	92,909	108,931	147,276
New Zealand	20,188	25,892	29,700
Other countries in Oceania	14,700	19,319	24,160
Total Oceania	127,797	154,142	201,076
Total throughout world	4,746,722	5,313,904	6,170,000

NOTE:—In the case of countries the boundaries of which have undergone change, the figures for each year represent the number of miles of telegraph wire within the boundaries of that year.

Telegraph wire used exclusively for railroad operation and not open to public use has been excluded wherever possible.

TELEPHONE (*see* 26.547).—Various improvements were made during 1910–21 in the mechanism and working of the telephone, apart from the introduction of wireless telephony, which is dealt with in the separate article under WIRELESS. Since operating practice and the application of recent inventions are not always the same in the United States as in Great Britain, some developments which are not common to both countries are described in the section headed *United States*. At the end of that section will be found a table showing the expansion of telephone facilities during the years 1910–21 in all countries.

GREAT BRITAIN

Private Branch Exchanges.—The increasing use of the telephone as between one party and another was early followed by a demand for the means of connecting different members of a firm in the same building without the necessity for providing each with a separate line to the public exchange. A further development required that incoming calls for a large firm should be dealt with at a central point in the initial stage so that after ascertaining the business of the caller he could be placed in communication with the particular department concerned. To meet these needs switchboards similar in general principles to those provided for main exchanges have come into use. The call from a local extension or from the main exchange is answered by the branch exchange operator, and the connexion is completed by the medium of connecting cords, or, on small systems, by circuits with which each line is associated by means of a key. In the latter case the depression of any pair of keys on a common connecting circuit places the two corresponding lines into connexion with one another. On the smaller installations where it is probable that an operator is not always available to give prompt attention to calling and clearing signals, the extension stations signal the completion of their conversation direct to the main exchange and simultaneously to the branch exchange. This enables the main exchange to disconnect the circuit promptly, releasing the main exchange circuit and any junction circuits which may have been occupied by the connexion. The prompt release of these circuits is of extreme importance in the economical working of the whole system. On larger branch exchange systems where an operator is in continuous attendance, the main exchange clearing signals are controlled by the withdrawal of the cord connexion at the branch exchange. The advantage to be gained under this scheme lies in the fact that the extension station can call in the branch exchange operator during a conversation and get an established call from the main exchange transferred to another extension station when required. When a branch exchange is used in conjunction with a common battery or automatic switching system, the current for speaking purposes is fed over the main exchange lines on exchange to extension station connexions, and by means of a power lead from the main exchange in the case of extension to extension connexions.

When associated with automatic switching systems the branch exchange operator is provided with a calling dial, so that on each exchange connexion she can dial the number required by any extension station.

Trunk Line Working.—Trunk or long distance working is complicated by the necessity for recording the particulars of all calls, and because instantaneous connexion cannot always be effected owing to the prohibitive cost of providing lines with such liberality as would ensure a no-delay service at all times.

The system of the British Post Office is worked as follows: A subscriber desiring a trunk connexion calls up his local exchange and notifies his requirements. If circuits are available to the town required on such a basis as to afford a no-delay service, the connexion is effected at once and the signalling and control arrangements are similar to those described for junction working. The operator records the particulars of the call on a ticket which is used for future accounting purposes. Should a no-delay service not be available, the operator records particulars of the requirements herself, or, in cases where lines to the town required terminate at a separate trunk exchange, she extends the subscriber's circuit to the trunk exchange and obtains a direct connexion to a special record operator whose sole business it is to note the particulars of the required trunk connexion. The subscriber is informed that he will be called later and the connexion is then severed. Meanwhile, the ticket is conveyed to the switchboard position where the lines to the town wanted are terminated. Calls at this point are dealt with in order of priority as recorded by the time on the ticket when the demand was initiated. Particulars of the connexion wanted are passed to the distant operator, who extends the circuit direct to the line of the "wanted" subscriber, when such lines terminate in the same exchange, or extends the circuit to a junction, when the "wanted" subscriber is connected to another local exchange, and requests the operator at that exchange to effect the connexion. The trunk operator at the originating town simultaneously effects the connexion direct, or where another local exchange is concerned, by the medium of a junction, to the initiating subscriber, and when both subscribers are on the line, she completes the connexion. The call is controlled by the trunk operators, the junction circuit being equipped in such a manner that the subscriber's signals appear at the trunk exchanges, from which point disconnecting signals are sent automatically to the local exchanges when the connexions between the trunk and the junction circuits are removed.

Trunk exchanges are equipped with relays and lamps for signalling purposes. "Calculagraphs" are employed for stamping the time of commencement and completion of conversation on the tickets. There is also associated with each trunk connexion a device which lights a lamp as soon as the scheduled limit of the period of conversation is reached.

Where the volume of traffic over any route is considerable, the requirements to the distant town may be notified over a separate circuit reserved for the purpose, and the local connexions involving the use of junction circuits to other local exchanges can be established in advance, thus minimizing the time of occupation of the main circuits and securing the greatest possible effective use of the trunk lines.

Manual Exchanges.—The main features of the manual telephone system remained in 1921 what they were in 1910. Improvements had been introduced to some extent, to diminish or eliminate altogether portions of the operator's work, but common battery transmission and signalling, connecting by means of plugs, flexible cord conductors and jacks, lamp calling and supervisory signals—all these remained unaltered.

Among the improvements referred to may be mentioned: Keyless ringing; automatic listening; secret service; ringing tone; automatic ringing cut-off; traffic distribution; ancillary answering jacks.

1. *Keyless Ringing* is the feature of a cord circuit which provides that the ringing of the required subscriber's bell commences automatically on the operator connecting to his line and ceases automatically on the removal of the receiver from its rest by this subscriber. This renders unnecessary the provision of a key for ringing purposes—hence the term "keyless" ringing.

2. *Automatic Listening* is a feature which eliminates the listening key. The operator's telephone is automatically connected to the calling subscriber's line when the answering plug of the cord circuit is inserted in the answering jack of that line. The operator's telephone is later automatically disconnected when, after ascertaining the number required by the calling subscriber, the operator connects the calling plug to the line of the required subscriber.

3. *Secret Service* follows from 2. Automatic listening involves the feature that while conditions suitable for conversation are established the operator's telephone is disconnected—and without the aid of a listening key it is impossible for the operator to listen to a conversation.

4. *Ringing Tone* is a tone (distinctive from that intimating to a calling subscriber that the line he requires is engaged) applied to the calling subscriber's line while the bell of the called subscriber is being rung. Hearing this tone, which intimates that the bell of the called subscriber is being rung, and receiving no reply after a reasonable period, the calling subscriber infers that his correspondent is not available and restores his receiver. This facility reduces the time spent on "no reply" calls, by both operator and subscriber.

5. *Automatic Ringing Cut-Off* provides that the ringing of the required subscriber's bell automatically ceases when the calling subscriber, receiving no reply, decides to abandon the call and restores his receiver to its rest.

6. *Traffic Distribution.*—By means of selecting mechanism the line of a calling subscriber is automatically connected to a disengaged operator's position. This avoids the overloading of any operator and at the same time gives all operators a fair load during busy periods.

7. *Ancillary Jacks.*—Additional calling lamp signals and answering jacks associated therewith placed at different parts of the switchboard. When a subscriber calls, signals are displayed at two or more operators' positions, thus increasing the number of operators who may answer. The object of the arrangement is to provide for the more even distribution of traffic and thus to reduce the answering time of the operators during the rush periods.

Automatic Systems.—The idea of automatic telephony is to substitute for the operator of the manual exchange an electro-mechanical or other switching system, which, controlled in its movement by the action of the subscriber, will automatically select, connect and disconnect circuits as desired. The process of machine switching consists of successive group selection. Exchange switching machines are provided and are placed under the control of subscribers or operators. Considering only the former case, the machines are operated by impulses originating in a subscriber's telephone. The standard impulse now in general use is a disconnexion of the subscriber's loop (the loop having been closed in the first instance by the lifting of the subscriber's receiver). The train of impulses corresponds to the digit signalled. For instance, the signalling of the digit 7 would constitute a series of seven disconnexions of the subscriber's telephone loop as indicated in fig. 1. It will be seen that a complete impulse is 57% of the total cycle.

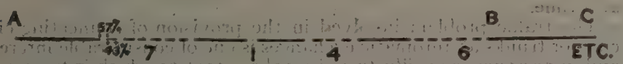

FIG. 1.

When the impulses are passing at the standard rate of 10 per second, this gives an electrical condition at the exchange of sufficient duration to effect reliable operation of the equipment.

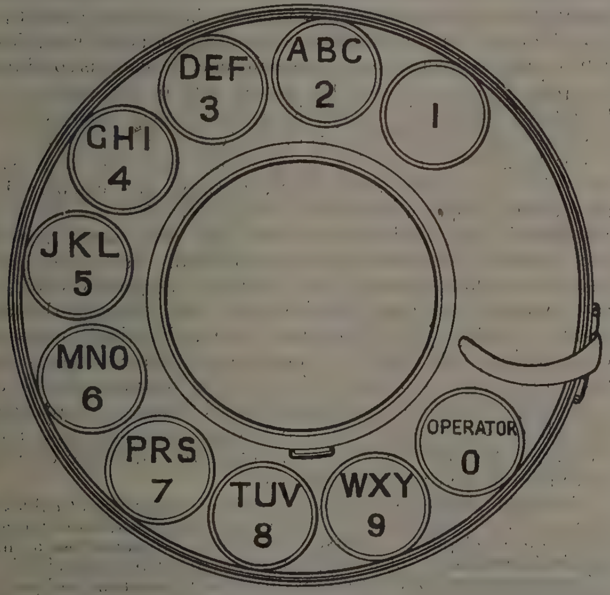

FIG. 2.

On the base of the automatic telephone instrument a circular device, known as the dial, is provided for transmitting the impulses. Fig. 2 shows a full view of the face of a dial that has been designed for use in large cities. It will be seen that there are 10 holes each of which corresponds to a digit, also that eight of the holes contain letters. Dealing first with the digits, the method of operation is for the subscriber to lift his receiver and then if he requires to call "7146" he will operate these digits in turn. To call 7 he will place his finger in the hole corresponding to that digit, rotate the front plate of the dial which is free to move in a clockwise direction until his finger and the finger hole for 7 reach the finger stop shown on the right-hand side of fig. 2. He will then withdraw his finger and the free plate of the dial will return to normal under the influence of a main spring, in doing which the mechanism of the dial will disconnect the subscriber's telephone loop seven times. He will now insert his finger in the hole corresponding to the digit 1 and proceed as before. The impulses passing from the dial will, as has been stated, be transmitted at the rate of 10 a second, and, as will be seen from fig. 1, the short current between the impulses, is only 43% of the cycle. An appreciable interval, by comparison, must occur between the trains corresponding to each digit because the process of manipulating the dial cannot be performed rapidly enough for it to be otherwise.

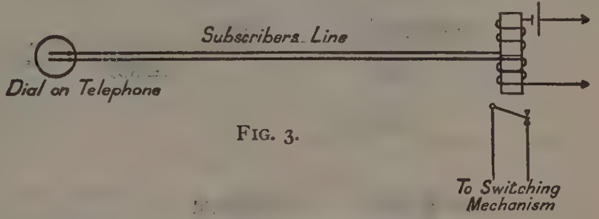

FIG. 3.

In practically all automatic systems the impulse circuit is as indicated in fig. 3, from which it will be seen that the operation of the switching mechanism is controlled by the falling back of a relay armature at the exchange.

The mechanism at the exchange is so designed that by the provision of a sluggish relay or equivalent device certain controlling connexions remain unchanged throughout the whole of the train of impulses, but the long current corresponding to the period between two trains is utilized for effecting a change-over so that each train operates a separate switching device. Briefly the effect is to produce successive selection as already indicated. The operation of the digit 7 in a typical case would operate the mechanism so that an idle outgoing connecting line of the 7th thousand is found. The following digit, 1, will pick out an idle outgoing connecting line to the 1st hundred in the 7th thousand being the 71st hundred. At this point it is common practice to give the subscriber connexion with a switch that can select any one of the 100 lines in the group, so that the next two digits 4 and 6 will call line 46 in the 71st hundred, viz. line 7146.

Automatic systems may in the main be roughly placed in two classes: (*a*) direct impulse systems; (*b*) stored impulse systems.

In the direct impulse system may be placed the systems of The Automatic Electric Co., Siemens Bros. & Co., The North Electric Co., and The Relay Automatic Telephone Co. (including licensees of the firms concerned).

The Automatic Electric Co. and Messrs. Siemens Bros. & Co. manufacture what is known as the "Strowger" system, the switches of which in operating utilize two motions, first, a vertical action in which the brush is not making contact followed by a rotary action in which the brush is either hunting for an idle connecting line in the case of a preliminary switch or moving towards the contact of the wanted subscriber's line in the case of a final switch. Two magnets are involved in this operation. There is a third magnet used for effecting the release at the end of the conversation, the operation of release consisting in the restoration of the moving element to normal, first in a rotary direction by means of a main spring and, secondly, in a vertical direction under the influence of gravity.

Fig. 4 shows the elementary circuit connexions for one of these systems. The calling subscriber on lifting his receiver operates relay "LR" which in turn operates "RR." The impulses are received on "LR" whose armature falls back for each impulse placing an earth connexion intermittently on the circuit of "S" and "VM." Both "RR" and "S" are sluggish relays that release slowly so that the succession of "breaks" and "makes" from the impulses do not affect them. When the long current between two trains of impulses occurs the circuit of "S" is disconnected for a period which is long enough for its operation, and "S" electromagnetically operates the switch "SS" so that "VM" is thrown out of circuit and "RM" is substituted. "VM" is the magnet which operates the vertical stepping by means of a ratchet and pawl device. "RM" similarly effects the rotary stepping. The next train of impulses will clearly operate "RM" after which the change-over devices depending on "S" are made to cut out the accessory mechanical apparatus, leaving only the connexions suitable for giving the engaged signal, ringing the subscriber, and talking. At the end of the conversation the caller hangs up his receiver, the armature of "LR" falls back permanently, "RR" is deënergized and the release magnet "REL" is operated thus restoring the switch to normal: "REL" disengages a detent which permits a coiled spring to restore the wipers or brushes in a rotary direction after which gravity carries them vertically to their home positions at which stage the "REL" circuit is opened at "ON." The transmission system consists of two relays "LR" and "LC" associated with two condensers as shown at the top of fig. 4. This will be recognized as the "Stone" C. B. system (*see* 26.552).

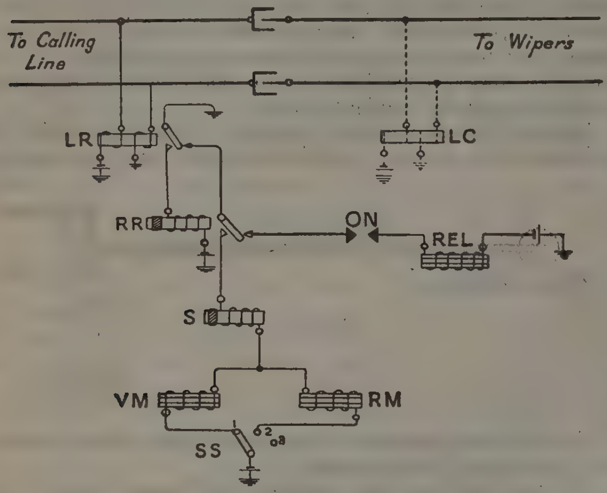

FIG. 4.

The North Electric Co. manufactures a switch operated by direct impulses in which the motions are the reverse of the systems just described. Rotary action, with the brush away from the contacts, is followed by "trunk" hunting in a vertical direction. This permits of vertical contacts which are less liable to the adverse influence of dust than horizontal contacts, and would also permit of a larger number of trunks than 10, being placed in one group without seriously interfering with the design of the equipment.

Both the Relay Automatic Telephone Co. and the North Electric Co. manufacture automatic systems which do not use mechanism as usually understood. The systems consist of aggregations of relays, combined so as to provide a number of connecting or "trunking" paths through the equipment. In the case of the Relay Automatic Telephone Co.'s system the calling subscriber operates his dial in the usual way and at the same time finds an "outgoing" trunk. His impulses operate relay devices known as the "recorder" and the "marker," which latter places an electrical condition on the called subscriber's line so that it immediately operates somewhat like a called line, and finds an idle "incoming" trunk which is placed in communication with the outgoing trunk already seized by the calling party. These two trunks are automatically placed in contact and together form the connecting link for the conversation.

The earliest practical stored impulse system is the "Lorimer" system as used at Hereford (England). In this case the dial as already described is not used, but a lever device is associated with each telephone. The levers are set in definite positions corresponding to the number to be called, and the switches at the exchange are set in motion by the subscriber operating a subsidiary crank that forms part of the calling device. The operation of this crank also winds up the mechanism of the calling device so that the operation of the switches on the exchange can electromagnetically release the calling device and run it down. The running down of the calling device in conjunction with the operation of the exchange switches controls the action of the latter by means of an electrical circuit established through the setting of the levers so that the exchange switches are made to trunk, hunt and find lines in a manner corresponding to the lever setting. The mechanism at the exchange is driven by a motor and can therefore be provided with robust contacts. A subsidiary device known as a pilot switch can be made to operate and alter the connexions between digits or at any other stage of the call so as to control the sequence of switching operations.

The Western Electric Co.'s rotary and panel type systems possess the obvious advantages to be derived from storing connexions and the interpolation of controlling operations at any stage of a call. In both these systems the subscriber's telephone is equipped with a standard dial, and the impulses are taken up by the sender storing device at the exchange. This device is set into position by the impulses and subsequently controls the action of the selective switches in a manner somewhat similar to that indicated for the Lorimer system above mentioned. In the Western Electric Co.'s systems banks of contacts for 200 and 500 lines respectively are employed, as against 100-line banks for direct-impulse systems, so that the number-storing device is also required to perform the functions of a numerical transformer changing the call record from the decimal system as dialled into whatever system is necessary for the correct operation of the switches. An additional feature associated with the panel system of the Western Electric Co. is the provision of a translator which consists of a cross-connecting device so arranged that any number dialled can be converted from time to time into some other number. This is particularly desirable in the case of large cities in which the selection of exchanges is effected by means of a code. It will be seen on reference to fig. 2 that eight of the finger holes have in addition to the digits a group of three letters. These are arranged in alphabetical order from A to Y omitting Q. The use of these letters is to facilitate the calling of subscribers in areas where manual telephones coexist, and where in the ordinary course very cumbersome numbers would otherwise be involved. The arrangement provides a means of facilitating the conversion of an existing manual area to automatic working. The number "Mayfair 2148" is printed in the directory "MAYfair 2148," and so long as any manual exchanges in the area exist the numbers would be passed in the ordinary way, but as automatic exchanges are introduced the subscriber will obtain connexion by dialling "MAY 2148." It will of course be recognized that to dial MAY is really to dial "629," and the switching equipment must be such that the dialling of this code will give the subscriber connexion to an idle junction circuit outgoing to the Mayfair exchange whether that exchange be an automatic or a manual one. Owing to variations in traffic the size of the junction groups to Mayfair will vary from time to time, and redistribution of junction lines in the automatic equipment will be essential. The translator mentioned provides the means whereby this can be effected, because the transformation by means of the "impulse cross connexion field" will make it practicable for "MAY" to be reconverted into any combination of the 10 digits when taken three at a time.

The traffic problem involved in the provision of connecting circuits or trunks at automatic exchanges is one of considerable interest and importance, as is illustrated by the extent to which it figures in the bibliography appended.

Wire Plant.—If the distribution to the subscribers is underground throughout, the main cables are now subdivided into smaller units, bifurcated or multiple branching joints being made between the main and subsidiary cables. The latter cables are accessible in footway boxes, and are terminated in such a way that one or more pairs of conductors can be led direct into any adjacent premises by a small lead-covered paper-core cable. The end of the small cable in the subscriber's premises is terminated in such a manner as to prevent the ingress of moisture.

If, however, the distribution is by means of aerial wires from a pole which is erected to serve a small zone, the cable is continued to a point about 2 ft. below the lowest arm of the pole, and is terminated in a solid or sealed joint from which separate lead-covered leads extend the pairs of conductors to insulators.

For long-distance service up to about 1910 the wires were erected on pole lines along roads, railways and canals. The hard-drawn copper wire of high conductivity (invented by T. B. Doolittle in 1877) is invariably used; and wires weighing from 150 to 800 lb. per mile have been employed. It was necessary to carry the long-distance lines through underground cables in the approaches to large English cities, but owing to the inefficiency of cable wires as compared with aerial wires for speech transmission, the length of underground cable sections was kept down to a minimum. As the long distance service expanded and the number of lines increased it became increasingly difficult to find routes for new pole lines, especially near large cities, and the need for improvement in the efficiency of cable wires became a very pressing matter.

The disadvantages of the earlier types of underground cables as compared with aerial lines were: (*a*) much greater attenuation and distortion of telephonic currents; (*b*) inability to superpose a third circuit, known as a "phantom," on each pair of physical circuits.

Towards the end of the 19th century Oliver Heaviside had proved mathematically that uniformly distributed inductance in a telephone line would diminish both attenuation and distortion, and that if the inductance were great enough and the dielectric conductance not too high the circuit would be distortionless, while currents of all frequencies would be equally attenuated. Following up this idea Prof. M. I. Pupin showed that by placing inductance coils in circuit at distances apart less than half the length of the shortest component wave to be transmitted, a non-uniform conductor could be made approximately equal to a uniform conductor.

Pupin's system of "loading" telephone conductors has been applied in England mainly to underground cables, and many improvements have been made in recent years, so that it is now possible to obtain the same transmission efficiency from an underground telephone circuit as from an aerial circuit of equivalent gauge.

The difficulties encountered in working underground cable circuits were exhaustively investigated by the British Post Office in the first decade of this century, and it was proved that the inability to obtain phantom circuits was due primarily to want of balance between the electrostatic capacity of conductors in respect to (*a*) other conductors and (*b*) to earth. As a result of the earlier investigations the method of laying up the conductors in pairs to form a complete cable was radically changed. A type of cable known as the "quadruple pair" was introduced. In this type the conductors are lapped with insulating paper twinned together in pairs, and are arranged in "cores" each containing four twisted pairs laid up together around a centre, usually of yarn, forming a "quadruple pair" core. The cores are laid up together to the number required and sheathed with lead. This type of cable was a great improvement on the earlier "twin" cables, and permitted the formation of a superposed "phantom" circuit on two physical circuits. Diagonal pairs in the same core are selected for superposing.

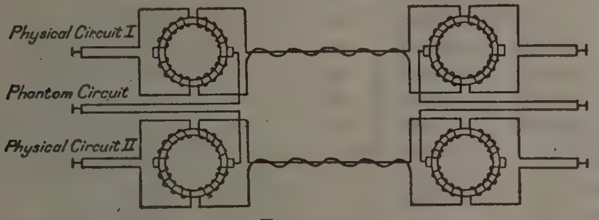

FIG. 5.

In a later type of cable known as the "multiple twin cable" the centre of yarn is dispensed with, and the cable consists of a number of 4-wire cores made up of two 2-wire cores twinned together. The manufacture of this type of cable has been greatly improved in recent years, and cables are now produced with very small out-of-balance capacities between wire and wire, and between wire and earth. It is still, however, necessary to balance the cables after laying by a systematic method of jointing contiguous lengths, whereby conductors are selected and jointed in such a manner as to secure maximum uniformity of characteristics.

A method of loading the phantom circuit in telephone cables was invented by G. A. Campbell and T. Shaw in the United States and patented in Great Britain in 1911. This method was applied to a cable laid between London and Birmingham in 1914 and extended to Liverpool in 1916.

The phantom circuit is obtained by means of specially wound transformers joined across the ends of the physical circuits. The cores of these transformers consist of a ring made up of very fine soft iron wires. Fig. 5 illustrates the method of connecting.

Telephone Repeater.—The art of long-distance telephony was advanced a further and more important stage by the introduction of a practicable type of telephone relay or repeater in 1913.

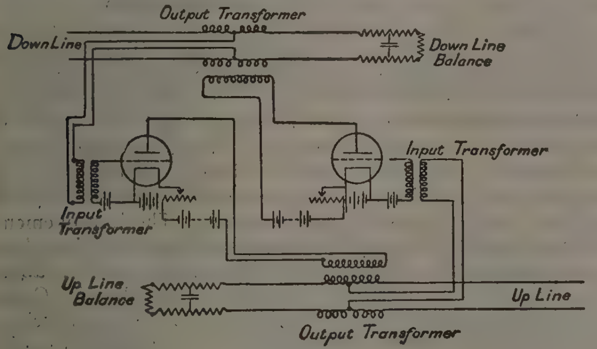

FIG. 6.

The conception of a repeater which could be inserted in a telephone circuit and fulfil the same functions as a repeater in a telegraph circuit is almost as old as the telephone itself. Early attempts at a solution of the problem were invariably in the form of a sensitive microphone attached to the reed or the diaphragm of a receiving apparatus, but the fundamental defects of repeaters of this type, due primarily to the inertia of moving mechanical parts, prevented their successful application in commercial service. It was not until the development of the 3-electrode thermionic tube had reached the stage of commercial production for wireless telegraphy purposes in 1913 that the problem of the telephone repeater could be solved. Since that time progress has been so rapid as to cause almost a complete revolution in long-distance telephony.

A modern telephone repeater for insertion at an intermediate point in a long telephone line consists essentially of two thermionic tube amplifiers, one for the up and one for the down side of the line circuit, associated with apparatus for balancing the line circuits for duplex working, the telephone circuit being necessarily a duplex circuit. The general arrangement is shown in fig. 6.

The telephone repeater may be used to extend the range of speech over existing lines, as for instance a London–Paris line may be extended by a repeater at Paris to any distant city in direct communication with Paris; a second repeater at the distant city may relay the line again to a further point and so on. In fact it may be said that telephonic speech is now possible over any length of wire circuit. Speech through submarine cables is, however, still limited to comparatively short distances.

The most important application of the telephone repeater, and one in which the greatest economies are possible, is in the internal communications of a country. For instance, in order to provide telephonic communication between, say London and Manchester, Leeds, Newcastle and Glasgow, it has hitherto been necessary to erect line conductors weighing on the average 600 lb. per circuit mile. A London–Newcastle line thus requires about 180,000 lb. of copper. It is now possible by using four telephone repeaters at intermediate points between those two cities to provide equally good communication over conductors weighing only 80 lb. per circuit mile, and these conductors may be contained in an underground cable which will carry 240 circuits. The combination of telephone repeaters with underground cables affords a service of greater efficiency than can be obtained from heavy aerial lines, and a service free from interruption by storms.

Fig. 7 is a plan illustrating a scheme for providing telephonic communication between all the important towns of Great Britain by means of underground cables and telephone repeaters. The construction of this extensive system was well advanced in 1921 and was due for completion in 1925.

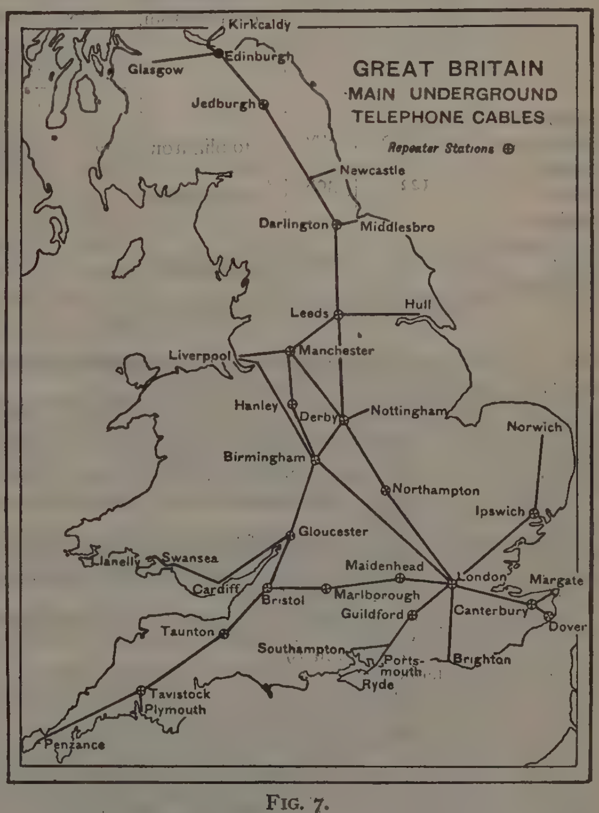

FIG. 7.

A list of representative types of main underground telephone cables in Great Britain is given in the table.

Submarine Telephone Cables.—The problem of loading deep-sea cables with inductance coils, and thus increasing the possible range of speech transmission, was successfully solved in 1910, when Messrs. Siemens Bros. & Co. manufactured and laid for the British Post Office between Dover and Calais a 4-core submarine cable loaded with inductance coils at intervals of one nautical mile. The transmission efficiency of this cable was rather more than three times as good as that of a similar cable without loading coils.

In 1911 Messrs. Siemens introduced a form of balata dielectric as a substitute for gutta-percha in loaded submarine cables on account of the greatly reduced leakance of the former as compared with the

latter. The effect was to reduce materially the attenuation constant and increase the range of speech in loaded cables.

The improved dielectric was used in a cable laid in Aug. 1912 between St. Margaret's Bay, Dover, and La Panne, Belgium. This cable contained four copper conductors, each weighing 160 lb. per nautical mile and insulated by a dielectric weighing 150 lb. per mile (as compared with 300 lb. per mile in the 1910 Anglo-French cable). The variation of attenuation with frequency is much less in the 1912 cable than in the earlier one.

The Anglo-Belgian cable had another special feature, namely, the provision of loading coils for a third circuit superposed on the two physical circuits. The loading coils for all three circuits were placed together at intervals of one nautical mile.

A similar cable with some further improvements in dielectric and loading coils was laid across the Irish Sea between Nevin, Carnarvonshire, and Howth, co. Dublin, in 1913.

A submarine telephone cable of the continuously loaded type was laid across the English Channel by the French Government in 1912, between the same points as the 1910 coil-loaded cable. The weight per nautical mile of dielectric is the same in both cables, but each copper conductor of the former weighs 300 lb. per mile as compared with 160 lb. per mile in the latter. The transmission efficiency of the cables is practically equal, but the continuously loaded cable provides an additional circuit by superposing. Experiments conducted on this cable in 1914 proved the possibility of obtaining four circuits from a continuously loaded 4-wire submarine cable by introducing an improved method of balancing the electrostatic capacity of the conductors. The fourth circuit has not yet been successful in a coil-loaded cable.

Several additional coil-loaded telephone cables were laid across the English Channel during the war period. Details of these cables are given in the Table.

With equal weights of conductor and dielectric, the relative transmission efficiencies of (*a*) coil-loaded and (*b*) continuously loaded 4-wire submarine cables are as 100 to 75, but the latter may provide four circuits as compared with three in the former. Experience has shown that the maintenance and repairs of coil-loaded cables are attended by difficulties which are not met with in continuously loaded cables.

The introduction of telephone relays has made it possible frequently to use submarine cables of a less efficiency than the coil-loaded cables previously required. Consequently, it is practicable to increase the use of continuously loaded cables, and the modern tendency is in that direction. (W. No.)

UNITED STATES

The more important improvements made in the United States during 1910–21 are briefly described below.

Exchange Cables.—Improvements in the design and the methods of manufacture of cables for use in local exchanges made it possible greatly to increase the number of wires of a given size in a sheath of given size. By employing wires of smaller diameter than those heretofore used the maximum number was still further increased. Cables containing either 900 wires No. 19 A.W.G. (·0359 in. diam.), 1,800 wires No. 22 A.W.G. (·0253 in. diam.), or 2,400 wires No. 24 A.W.G. (·0201 in. diam.) were extensively used in 1921. The improvements which rendered practicable these cables of maximum diam. have been employed also in cables of fewer pairs, thus enabling their diams. to be decreased and their costs reduced. Cables containing the smaller sizes of wire were used as extensively as was justified by their economic balance in relation to other portions of the plant. This resulted in the employment of considerable amounts of No. 24 A.W.G. conductor cable.

For a long time cable sheaths were made of lead alloyed with about 3% of tin, unalloyed lead not having the requisite strength and resistance to corrosion. Extensive research, directed toward finding a cheaper but no less effective alloy, resulted in 1912 in the adoption of lead alloyed with a small amount of antimony. Readjustments in the thicknesses of sheaths and in the composition of the insulating and binding paper produced still further economies.

Loading Coils in Exchange Service.—Many thousands of trunk circuits in multi-office exchanges and circuits connecting large cities with suburban points have been equipped with loading coils, pro-

viding transmission of such a grade as would require from 5 to 10 times as much copper in the cable circuits if loading were not employed. Loading coils have been materially improved by constructing the cores of several rings, each of which is made by compressing finely divided particles of iron with a binding material which acts as insulation between the iron particles. There may be as many as thirty thousand million of these particles in the core of a cable loading coil. These cores are more uniform and stable than the wire cores formerly used and are much less affected by excessive currents which may accidentally come into the circuit.

Long-Distance Telephony—Open Wire.—At the beginning of the decade 1910–20, the limits of telephone transmission were about 1,200 to 1,500 m. in open wire. These limits were extended rapidly so that in 1921 practically all parts of the continental United States were placed in communication with each other over distances of 4,000 m. and upwards, employing overhead wires no larger than those used to give the restricted service of 1910. These improvements were made with only slight changes in the lines and equipment and with no change whatever in the subscriber's station apparatus. They depended upon the development of satisfactory repeaters with their associated apparatus and methods of use. The form of repeater generally employed in 1921 was the 3-element thermionic tube. Devised primarily for radio purposes, it was so adapted as to become a remarkably effective repeater. This required that a large amount of auxiliary apparatus be invented and developed and methods devised for balancing the lines and making them suitable for the operation of this apparatus. The amplifier or repeater receives the minute attenuated telephone currents and sends out currents of exactly the same form but greatly enlarged. The transmission gain which may be obtained with vacuum-tube amplifiers in two-way operation depends on the electrical conditions of the line in which the amplifiers are used. This has a great effect on line design.

Transcontinental Telephony.—By the development of methods by which the loading coil could be applied to the heaviest gauge wires and such wires, when equipped with loading coils, could be operated on the phantom principle, it became practicable, in 1911, to provide telephone service between New York City and Denver, Col., and greatly to improve the transmission of speech between cities less far apart. By the application of the phantom principle to such circuits the available facilities were largely increased so that, between the important telephone centres, notable improvements in service were accomplished. On Jan. 25 1915, the transcontinental line of the Bell System was formally opened for business and after that time commercial service was given between the cities on the Atlantic Coast and those on the Pacific Coast. The service in 1921 was handled over a group of 4 non-loaded wires equipped with telephone repeaters. By using the 2 side circuits and the phantom circuit formed by these wires, 3 simultaneous transcontinental connexions may be established. By means of the addition of compositing apparatus to the circuits the 4 wires which carry 3 telephone circuits also carry 4 telegraph circuits. These 4 telegraph circuits may be arranged to transmit 8 simultaneous messages. The line from New York City to San Francisco is 3,400 m. in length.

Long-Distance Telephony—Cables.—By 1906 a cable 90 m. long was successfully operated between New York and Philadelphia, but, in the then state of the art, that cable could not be used for connexions extending beyond New York or Philadelphia. In 1911, an underground cable was designed capable of giving a satisfactory conversation between Washington and Boston. By 1912, a section of this new cable was laid from Washington to Philadelphia, there connecting with the earlier type of cable to New York. During 1913, a section of the new cable was laid between New Haven and Providence, connecting at New Haven with an earlier type of cable extending to New York and connecting at Providence with an earlier type extending to Boston. Although talking over the whole distance from Boston to Washington was not possible so long as stretches of cable of the older types had to be employed, yet by using the underground in connexion with the overhead, the seaboard cities from Washington to Boston could no longer be isolated by storms destroying the overhead lines. During 1913, the advances in the art of loading and balancing underground circuits together with the repeater developments made it possible to talk satisfactorily by underground wires from Boston to Washington, a distance of 455 m. even though 47 % of the total cable in the line was of the types formerly suitable for short-haul working only. In 1912, talking by underground wire for the first time between New York and Washington represented the longest distance achieved. By 1913, this distance had been doubled. The Boston–Washington cable was several times longer than any other in the world. There were in 1921 several cables working along the Boston–Washington route. During 1919, the extension of the toll cable system from Philadelphia to Harrisburg, Pa., was completed. Taken in combination with the cables already working between Boston and Washington, this gave a through toll cable route from the important points on the eastern seaboard as far west as Harrisburg. In 1921, this cable was extended from Harrisburg as far W. as Pittsburgh, a distance of 192 m. from Harrisburg and 304 m. from Philadelphia. For the greater portion of the distance the cable was supported aerially on poles. The composition of this cable was as follows:—

Section	Quads No. 16 A.W.G.	Quads No. 19 A.W.G.
Harrisburg–Ligonier	16	125
Ligonier–Pittsburgh	19	120

At the intervals of about 60 m. substantial brick buildings were erected for use as repeater stations to house the equipment, apparatus, power plant and test boards that make up a modern repeater station. General plans were completed for extending this cable from Pittsburgh to Chicago.

The installation of these toll cables resulted in economies due not only to the reduced annual charges on additional circuits as required and less expense for routine maintenance, but also to the fact that the losses resulting from storm damage to open wire were avoided, as were also losses in revenue and reaction on the service during storm periods. Much is thus done to stabilize the toll plant and reduce expenditures as well as further to improve the service. By means of the improvements which had been made it became possible to carry on satisfactory talks over wires in cables more than 2,000 m. in length (where commercial conditions justify such cables) and this was accomplished with practically no more copper in each circuit than had been used in the earliest forms of cable which, as lately as 1882, caused serious interference with transmission when employed in lengths of only a fraction of a mile.

Repeater development reacted on the loading art, requiring the development of loading coils of great magnetic stability and uniformity. Such stability is also particularly important on long circuits which are composited for telegraph operation in order to prevent the telegraph from interfering with the telephone transmission. Although these loading and repeater developments greatly extended the use of cables for long-distance transmission they made it imperative to keep open-wire circuits as free as possible from cable in order to prevent the electrical irregularity thus introduced from reacting on the repeater operation.

Submarine Cables.—In 1921, telephone communication was established with Cuba by means of submarine cables connecting Havana with Key West. These cables brought all of the principal places in the United States into telephonic communication with Havana and other important places in Cuba. There were in 1921 3 cables, each about 115 m. in length. Except at the terminating points, the cables were laid some miles apart in order to minimize the danger of simultaneous interruption as the result of accident. The average depth was about 3,000 ft. and in some places depths of more than a mile were reached. The main portion of each cable had a single conductor, two conductors being employed in the shore ends. The main conductor weighed 350 lb. per m. and consisted of 7 strands of copper wire. The conductor bore a wrapping of fine iron wire, this being covered with gutta-percha enclosed in copper tape which served as a return grounded conductor. By the use of multiplex methods each cable handled simultaneously one telephone and two telegraph messages. Each cable is expected ultimately to handle two or more additional telegraph messages. The use of single conductor cables, the telephone amplifiers, the terminal telegraph apparatus, and the devices for permitting the telephone and telegraph to operate simultaneously, all differed from earlier practice.

The largest submarine cable equipped with loading coils in 1921 was that which crossed Raritan Bay from Staten Island to New Jersey. It was upwards of 28,000 ft. in length, was loaded at 5 points and contained 37 quads of No. 16 gauge wires and 12 pairs of No. 22 gauge test wires. Each loading pot was approximately 16 ft. long and weighed 4 tons. The cable was laid in shallow water, the average depth being 10 ft. at mean low tide.

Carrier Current Telephony.—From the earliest days of the telephone and telegraph there were many attempts to develop multiplex transmission of messages. It was while working on the problem of multiplex telegraphy that Dr. Bell had his first conception of the structure of the original telephone. The long series of inventors, scientists and engineers who have contributed to the development of the multiplex art includes Gray, Edison, Mercadier, Pupin, Hutin, Leblanc, Stone, DeForest, Vreeland, Ruhmer, Squier, Wagner and others. In 1918 research experts and engineers of the Bell System completed the development of a commercial multiplex telephone and telegraph system and put it into operation between Baltimore and Pittsburgh. By means of this multiplex system, 4 telephone conversations may be had simultaneously over one pair of wires in addition to the telephone conversation provided by the ordinary methods. Thus, over a single pair of wires, 5 telephone conversations are simultaneously operated, each giving service as good as that provided by the circuit working in the ordinary way.

In telegraphy, as compared with the ordinary duplex telegraph circuit, this multiplex system permits at least a tenfold increase in messages. Although the commercial installations in use in 1921 provided only 4 additional conversations, the limitations as to number of telephone or telegraph messages on a single circuit were determined entirely by economic considerations. The operation may be considered to consist of combining the telephone current with high frequency current, transmitting this combination over a line wire, and, at the receiving end, removing the high frequency current and leaving the telephone current. The high frequency current serves as a " carrier " for the telephone current over the line.

Simultaneous transmission of several telephone currents is accomplished by means of selective apparatus by which one particular receiving channel is made easily receptive to one particular set of high frequency currents and, at the same time, acts substantially as a barrier to the currents of other high frequencies which are carrying telephone conversations other than those which the channel in question is designed to receive.

The operation involves the following steps: (1) Generation of carrier current, (2) Modulation, (3) Demodulations, (4) Separation of channels by selective circuits, (5) Repeaters for amplifying currents of carrier frequency at intermediate points.

(1) *Generation of Carrier Current.*—Carrier currents of various frequencies are for convenience obtained from well-known forms of vacuum-tube oscillators. In general the telephone multiplex frequencies run about 10,000, 15,000, 20,000 and 25,000.

(2) *Modulation.*—This term is applied to the process by which carrier current, produced by an oscillator, is so combined with voice currents from a telephone transmitter that the variations of the latter are impressed upon the former. The carrier and voice frequencies are applied together in the grid circuit of a vacuum-tube modulator together with a steady battery voltage.

(3) *Demodulation.*—This is a complementary process of modulation. Modulation may be thought of as elevating the band of essential speech frequencies to a position adjacent to the carrier frequency, and demodulation may be regarded as restoring this band to its normal position in the frequency scale.

(4) *Separation of Channels by Selective Circuits.*—When a number of channels, each employing a different carrier frequency, are operated simultaneously on a common line, each channel must be connected with the line through selective circuits which transmit only the range of frequencies assigned to that particular channel. Not only must the demodulator assigned to a given channel be prevented from receiving, from the line, currents of other channels, but the sending modulator must be prevented from putting on the line currents or frequencies outside of its assigned band. The appurtenances specially developed for accomplishing this selection in carrier current telephony are known as " band-pass electrical filters."

(5) *Reaction on the Telephone Plant.*—Carrier currents have imposed new requirements as to transpositions and it has also been necessary to develop new types of loading coils capable of transmitting the carrier frequencies, and also extremely uniform in impedance over the whole frequency range.

Limitations.—From the nature of the apparatus and methods employed, the system is not practically advantageous on short lines. In 1921 it was being applied to lines of 250 m. or more.

Carrier telephone systems were in commercial operation between the following points: Baltimore and Pittsburgh, Harrisburg and Chicago, Harrisburg and Detroit, Boston and Bangor, San Francisco and Los Angeles.

Loud-Speaking Telephones.—By the use of vacuum-tube amplifiers in connexion with specially developed transmitters and receivers, supplemented by large projecting horns, the human voice may be magnified thousands of millions of times so that a public speaker can make himself heard by a vastly greater number of people than ever before. By the use of apparatus and methods of this kind developed by the Bell Telephone System, President Harding's inaugural address in 1921 was heard by over 100,000 listeners standing in an open space of more than 10 ac. before the Capitol.

Radio Telephony.—In 1915 the engineers of the Bell Telephone System succeeded in transmitting speech from Arlington, Va., to the Eiffel Tower in Paris, and, simultaneously, to the Hawaiian Islands in the Pacific Ocean. Two experimental radio telephone transmitting and receiving stations were erected on the Atlantic Coast, one near Asbury Park, N.J., and the other near Plymouth, Mass. By means of these stations, radio telephone communication was maintained between the commercial telephone system and two ships experimentally equipped, plying from Boston to southern ports on the Atlantic Coast.

In July 1920 regular commercial radio telephone service was established between Santa Catalina Is. about 30 m. from shore, and the mainland near Los Angeles, Cal., at the latter point making junction with the local and long-distance wires of the Bell System throughout the United States.

The circuit is provided with through-line ringing of a type which is free from interference and there is a superimposed telegraph circuit capable of forming a link in a duplex wire telegraph circuit. The volume and quality of telephone transmission are so good that the radio link is regularly connected, whenever required, with long-distance wire circuits. On several occasions conversations have been carried on between a steamship on the Atlantic and the Avalon office at Catalina Is. in the Pacific, using the transcontinental wire telephone line as the connecting link overland.

Machine-Switching System.—A retrospective examination of the manually operated switchboard discloses the fact that the tendency of development has been continuously in the direction of increasing the number and extent of the operating functions which are performed electro-mechanically and likewise decreasing the amount of time required of the operator for the handling of the connexion. When a point is reached where the operations performed manually at the central office are eliminated, except in the case of certain special classes of calls, the term " automatic " or " machine switching " is applied to the switching equipment.

There are two principal types of machine-switching equipment, the " step-by-step " and the " panel " type. In both the apparatus at the central office is set in motion and controlled by a dial, associated with the substation set, and rotated by the subscriber. The "step-by-step" type of equipment makes use of a series of selectors in each of which contact is made by means of a central arm that can be raised to any desired level and rotated, at that level, to the proper one of a series of terminals arranged in the arc of a circle. This type of equipment is mostly used in the smaller cities and for automatic private branch exchanges. The "panel" type of equipment has been developed to a point where it is now being installed on an extensive scale in a number of the larger cities of the United States. On account of its importance a brief description is given.

Panel Type System.—The panel type equipment is so named because the multiple of the selectors is built in panels. The selectors have, in general, capacity for 500 lines or trunks. The multiple of these selectors consists of punched brass strips about 3 ft. long and one in. wide piled one above the other with insulation between. Since 3 connexions are necessary for each line or trunk, 1,500 of these strips are provided. The strips are divided horizontally into 5 groups or panels of 100 lines or trunks each and are mounted on frames having capacity for 60 selectors each, 30 on each side. The selector consists of a tube running vertically, close to the banks, the tube being equipped with a set of brushes for each bank. The brushes normally are held mechanically so that they do not engage the terminals. At the bottom of the tube, a friction clutch is provided which, by engaging constantly rotating shafts, can cause the tube to be raised or lowered. The brushes are multipled together by wires within the tube, these wires being attached at the top of the tube to feeder brushes which move over insulated feeder strips. The process of selection consists in first mechanically tripping the desired brush into engagement with its multiple bank, next in moving the tube carrying the brushes upward to choose the desired group within the bank, and finally continuing the movement upward to choose the desired subscriber's line or an idle trunk within the selected group. The subscribers' lines appear on the multiple of panel type selectors known as "line finders." The function of the line finder is to make connexion with calling subscribers' lines. It corresponds to the "A" operator's answering cord and the subscriber's answering jack in the manual system. The brushes of the line finder are attached to the brushes of a panel type "district selector" and also to the brushes of a small selector known as a "sender selector." As soon as a calling subscriber's line has been picked up by a line finder, the sender selector selects an idle "sender" out of a common group. When the calling subscriber dials, the pulses are registered in the sender which controls the setting-up of the connexion and is then freed. The sender may be likened to the operator of the manual system. The sender causes the district selector to choose a trunk to the desired office, or, if more than 500 outgoing trunks from the office are required, causes the district selector to pick out an idle "office selector" of the panel type which selects the desired trunk. The trunk incoming to the full mechanical office ends in the sender of an "incoming selector" of the panel type whose function it is, under control of the sender, to pick out an idle panel "connector" having access to the group of 500 lines in which the called subscriber's line may be found. Controlled by the sender, the connector then selects the called line.

Calls from a machine-switching to a manual office are completed over "call indicator trunks." As the calling subscriber dials his call, the district or office selector picks out an idle trunk to the desired office. This trunk ends in a plug before a "B," or incoming trunk operator in the called office. When a call appears on that trunk, the "B" operator depresses a display key associated with that trunk, whereupon the number which is desired in that office is quickly transferred by the sender to a bank of numbered lamps appearing before the "B" operator, and the "B" operator thereupon plugs the trunk into the desired subscriber's line.

For completing calls from a manual to a full mechanical office "key indicator mechanism" is employed. This is a mechanism which indicates to the "A" operator an idle trunk to the desired office which ends at that office at an incoming selector. The "A" operator by using a small 10-button key-set is enabled to control the incoming selector to make connexion through the aid of connectors with the called line desired.

Other Improvements.—In the United States there is a large and growing use of the telephone for communications essential to the operation of both steam and electric railways. The problem of minimizing the disturbing effect upon telephone circuits produced by induction interference from electric light and power circuits has resulted in careful, coördinated work by the power and telephone engineers. Important improvements have also been made in local and toll line operating efficiency.

Organized research has not only enabled the limits of telephony to be greatly extended but, at the same time, improvements and economies have been made in every department of the business.

Telephone Development of the World—January 1 1910, 1914 and 1920.

(Some of the figures—for the most part those for small places not shown separately—are necessarily in part estimated.)

	Jan. 1 1910		Jan. 1 1914		Jan. 1 1920

TELPHERAGE (*see* 7.63).—The World War saw, in the Italian army, amazing use made of the system of telpher transport for fighting on the Alps. When, after many years, snow, ice and avalanches will have all but cancelled every trace of the epic deeds performed in those regions, tourists who climb to the crests of the Adamello, the Marmolata, the Tofana and a hundred other peaks will hardly believe that thousands of men lived and fought for years in the very spots that they have reached only with difficulty, with the help of ropes and ice-axes, and in favourable weather.

Before the war it was thought impossible to conduct military operations on the high peaks. It was believed that the ordinary troops would be practically tied to the roads, that a company of "Alpini" with a few mountain guns would be the largest unit that could be used in places where only paths for mules existed, and that the rocky peaks, the snows and the ice, would be reached only by small groups belonging to specialist units, sent there to keep an eye on the enemy.

But from the earliest days of the campaign there happened on the Alpine front something very similar to what had occurred in France after the battle of the Marne, when Germans and French, in their common desire to outflank each other in the direction of the sea, finally reached the sea itself, thus forming one uninterrupted line from the Vosges to the Channel. On the Alps, with the object of capturing or turning the Austrian defensive lines, the Italians climbed higher and higher in ever-increasing numbers, the Austrians doing likewise, until the very tops of the mountains were reached and it became impossible to go farther. The most elevated points of the frontier having been thus occupied, the Italians put themselves in a position to meet enemy attacks as well as to face the inclemency of the climate: a hard and relentless struggle which had to be started afresh every time war operations involved a change of positions.

The first days of the war saw whole companies clinging hand and foot to the rocky summits; battalions encamped and freezing at a height of 3,000 metres. Field guns, drills, photo-electric stations were taken to pieces and carried up bit by bit to giddy heights, and there put together again. Food, water, ammunition were carried for many hours on mules, and thence transferred to columns of men who carried them for long hours more. At times the wounded and the sick had to be removed by securing them with ropes and letting them slide down gullies, or by allowing them to be jolted on stretchers along impossible paths. Very often they had to be attended to on the spot, behind a rock, because their condition did not allow of so painful a transport.

Numberless were the cases of men who, barefooted, with daggers in their mouths, would climb up the most impracticable summits during dark and stormy nights, and surprise the enemy where the latter felt sure that the ravines and precipices which surrounded him were his surest guards. Many times whole supply columns were crushed and buried by avalanches and rocks. Avalanches claimed thousands of victims among the troops on march, in hutments or in trenches. In certain places and at certain periods the danger was so great that when the men went out they were supplied with a long thin rope coloured in red. The colour came off with the damp and stained the snow, thus facilitating the search for men buried underneath.

The colossal work done at such great heights originated unheard-of conditions of defence and of existence. In places where until then a hurried visit with an experienced guide seemed a bold feat, in regions where there was perhaps one isolated Alpine hut in which it was considered an ordeal to spend one or two nights, there were constructed hutments, telegraph and telephone offices, infirmaries, workshops and stores. In such places, at a height of over 3,000 metres, tens of thousands of men spent several winters. To prepare these encampments both for shelter and for defence, it became necessary to excavate in the rock an enormous quantity of vast caves. In some places an underground city was cut in the rock with inter-communicating caves lined with timber and provided with water-pipes, electric lighting, etc. Galleries were excavated in the ice, between the Italian and Austrian trenches, leading under cover to advanced posts or even well into the enemy's lines. Gigantic operations with mines were also carried out. Cutting the rock was rendered possible thanks to the great perfection of the compressed-air drills. During the war the Italians turned out an admirable type of motor-driven air-compressor, which met with success also in the Allied armies. On the Italian front there were 20 large plants for fixed drills and about 4,000 groups of portable drills of from 5 to 45 horse-power. The remarkable skill of the Italian miners facilitated considerably the carrying out of most important and difficult mining operations.

In road-making wonderful results were obtained. Once operations were transferred to the highest and most inaccessible points, where in many cases there was not even the narrowest path, it became an absolute necessity to create means of communication at once. Roads were constructed which allowed heavy artillery and motor lorries to reach points where a few months before only a mountain expert would have trod.

The total length of the roads laid down by the Italian army was in round figures as follows:—

1,600 km. . . . . of roads for mules
1,100 " . . . . . . " " " carts
3,100 " . . . . . . of roads for motor lorries.

But the building of roads could not always meet the requirements of troops operating in Alpine districts. It happened very often that the number of men detailed to a certain point did not justify the building of a road on such difficult ground; or that snow and avalanches in the winter prevented the safe use of means of communication already existing; or that the enemy's fire swept them; or, finally, that the occupation of new positions made it necessary to send supplies out of proportion to the available transport and before there was time to build a road. The difficulty in such cases was skilfully overcome by means of special mechanical transport. Wire railways or "telphers" were provided, thus economizing time, labour and oil, and avoiding congestion of roads. These telphers are a kind of suspension railway. A double metal cable called "bearer" is extended on trestles placed in a straight line at different distances on the sides of the mountain. There are two stations, one at the starting-point and the other at the end of the line. In one of these stations there is a motor which works an endless cable (the "drawer"), to which are fixed two or more small waggons. The cable turns and draws the waggons supported by the "bearer" cable by means of small wheels which run on it.

Different kinds of telpherage plants were used.

1. *Telefori.*—These were provisional lines moved by man power and used in the most advanced zones to supply isolated posts or trenches. Their average length was 500 metres and each could carry about 50 quintals a day.

2. Dismountable *Teleferiche.*—These were run by motors and were put up in advanced zones. Their average length was from 1,000 to 2,000 metres, and each could carry from 10 to 20 quintals an hour. They could be dismounted and were portable, and could be installed even where there were no roads. These lines proved most useful for the transport of supplies in newly occupied positions. When in 1917 the troops of the II. Army crossed the Isonzo and advanced on the Bainsizza (Bainitsa) plateau, they could not communicate with the lines in the rear except by means of the few and bad mule-paths; but after only four days a few telphers were already in working order, and on the tenth day there were no less than 12 doing service. Similar miracles of speed were performed in the new mountain positions between the Brenta and the Piave.

3. Permanent *Teleferiche.*—These were run by motors and were fixed. They were employed at some distance from the lines, and reached a maximum length of 8,000 metres. They could carry about 150 quintals per hour.

Some permanent *teleferiche* were already working before the war for the service of mountain fortresses, and some types of portable *teleferiche* had been studied and estimates prepared. Oil and electric motors were in use.

The telphers covered on an average a rise of 650 metres from the starting-point to that of arrival; but in some cases even 1,500. The trestles were often at very great distances from one another and placed on peaks, while the waggons ran over fearful abysses. In the highest regions the lines often ran at a height of 2,000 to 3,000 metres; a few were installed even at 3,500 metres above sea-level.

On the eve of the retreat from Caporetto, in Oct. 1917, 380 *telefori* and 530 *teleferiche* were in working order. The former had a total length of 190 km., the latter of 630. During the retreat about 550 *teleferiche* and *telefori* were lost or dismounted. At the date of the Armistice there were 270 *telefori* and 460 *teleferiche* run by motors. The former had a total length of 170 and the latter of 640 kilometres.

The telpherage lines laid on the Italian front transported in all 33,000,000 quintals, the load of 330,000 railway trucks.

The service was under a special central administration with a competent staff drawn from the telpher transport companies (one for each army). There was also a department for the supply and testing of the material and a depot-school with construction and repairing shops. The bulk of the material was built by private concerns, but set up by the military.

The services rendered by the telpherage lines were invaluable. It was only thanks to these lines that it was possible to maintain positions which the troops would otherwise have been compelled to abandon for want of supplies. They allowed detachments to be kept in almost impossible positions even during the winter, as well as assuring an adequate supply of ammunition for guns placed in the most inaccessible positions which men could not have reached if laden with shells. Thousands of lives were saved when their gently sliding waggons were used for the transport of wounded and sick, who were thus spared a lengthy and agonizing journey to hospital. (M. R.)

TENNESSEE (*see* 26.619).—The pop. in 1920 was 2,337,885 as against 2,184,789 in 1910, an increase of 153,096, or 7% as against 8.1% in the preceding decade. The negro pop. during 1910–20 decreased numerically from 473,088 to 451,758, and decreased proportionally from 21·7% of the total to 19·3%. The average density of pop. in 1920 was 56·1% per sq. m.; in 1910 it was 52·4. The urban pop. (in places of 2,500 inhabitants or more) increased from 20·2% of the total in 1910 to 26·1% in 1920. Only two cities, Memphis and Nashville, had in 1920 more than 100,000 inhabitants; only two, Knoxville and Chattanooga, had between 50,000 and 100,000. The following table shows the pop. and increase per cent. for the six cities exceeding 10,000 for the decade 1910–20:—

	1920	1910	Increase per cent
Memphis . . .	162,351	131,105	23·8
Nashville . . .	118,342	110,364	7·2
Knoxville . . .	77,818	36,346	114·1
Chattanooga . .	57,895	44,604	29·8
Jackson . . .	18,860	15,779	19·5
Johnson City . .	12,442	8,502	46·3

Agriculture.—During the decade 1910–20 the interests of the state remained predominantly agricultural. Although the total land area in farms decreased from 20,041,657 ac. to 19,510,856 ac., the improved land increased from 10,890,484 ac. to 11,185,302 ac., and the number of farms increased from 246,012 to 252,774. During the same period the average acreage per farm decreased from 81·5 ac. to 77·2 ac.; but the average value per farm increased from $2,490 to $4,953, and the value of all farm property increased from $612,520,836 to $1,251,964,585. The average value of land per acre in 1920 was $41.40; in 1910 it was $18.53. Of the 252,774 farmers in 1920 214,592 were whites and 38,182 were negroes. Of all farmers 148,082 were owners; 103,885 tenants; and 807 managers. Of the total 11,374 were women. The total value of farm crops in 1919 was $318,285,307, of which amount $144,778,157, or 45·5%, represented cereals; the total value in 1909 was $111,133,210, cereals representing 49·8%. The cereal acreage in 1919 was 4,186,373 ac. as against 4,136,647 ac. in 1909, an increase of only 1·2%. The following table shows comparative acreage, production, and value of the important crops for 1919 and 1909:—

		Acreage	Production	Value
Corn	1919	3,301,075	70,639,252 bus.	$127,150,649
" . .	1909	3,146,348	67,682,489 bus.	45,819,093
Oats	1919	162,417	2,413,409 bus.	2,534,082
" .	1909	342,086	4,720,692 bus.	2,378,464
Wheat	1919	684,497	6,362,357 bus.	14,506,174
" .	1909	619,861	6,516,539 bus.	6,913,335
Hay and forage	1919	1,751,123	1,907,345 tons	49,649,657
Hay and forage . .	1909	1,060,480	1,100,838 tons	12,784,783
Cotton	1919	807,770	306,974 bales	48,808,866
" .	1909	787,516	264,562 bales	17,966,517
Tobacco	1919	138,561	112,367,567 lb.	24,720,869
" .	1909	90,468	68,756,599 lb.	5,661,681

The value of vegetables sold in 1919 was $27,947,250 and of fruits and nuts $7,888,912; the values respectively in 1909 were $10,430,975 and $4,486,281. Of the chief domestic animals on farms in 1920 and 1910 the number and value were as follows:—

		Number	Value
Horses	1920	317,921	$35,582,960
"	1910	349,709	39,320,044
Mules	1920	352,510	51,042,649
"	1910	240,282	32,489,724
Cattle	1920	1,161,846	51,370,208
"	1910	996,529	20,690,718
Sheep	1920	364,196	4,021,678
"	1910	795,033	3,009,196
Swine	1920	1,832,307	19,477,775
"	1910	1,387,938	7,329,622

In 1920 there were 11,835,303 fowls valued at $10,591,690, and 191,898 hives of bees valued at $698,258. In 1919 the reported milk production was 115,119,224 gal.; the value of milk, cream, and butter fat sold and of butter and cheese made was $20,640,849. The office of inspector of apiaries was created in 1911. The Smoky Mountain area (59,213 ac. in Blount and Sevier counties) and the White Top area (33,619 ac. in Johnson and Sullivan counties and Washington co., Va.) were approved for purchase in 1912 by the National Forest Reservation Commission under the Federal Act of March 1 1911 to preserve upland watersheds. In 1920 254,118 ac. of farm land were reported as provided with drainage and 640,479 as needing drainage. Capital invested in drainage enterprises, Dec. 31 1919, totalled $2,925,944. On that date there were completed 777 m. of open ditches and 42 m. of levees; there were under construction 135 m. of open ditches and 10 m. of levees. Most of these enterprises are in the western division of the state, where the tributaries of the Mississippi are utilized. The above figures do not include private supplementary works installed by individual farmers.

Mineral Products.—Tennessee produces most of the copper mined in the southern states. Its entire product of copper, gold, and silver comes from mines worked primarily for copper in Polk county. Lead production, first reported in 1915 (1,660 lb.), amounted to 4,376,000 lb. in 1919. In the latter year gold was valued at $5,662. The silver output was 98,288 oz.; copper 15,623,589 lb.; zinc 47,494,000 lb. Because of strikes the coal amounted to only about 5,000,000 tons. The demands of the World War led to the working of known manganese deposits in 16 counties. In 1916 oil was discovered in Scott county, and later some producing wells were drilled. In 1919 the Bankers Petroleum Co., of New York, obtained large tracts of land in Robertson and Dickson counties, a promising shallow-oil field. In 1910 natural gas was found near Franklin. In 1919 the production of phosphate rock was 473,985 tons.

Manufactures.—The product of manufactures remains relatively small, the value of 1914 being less than 1 % of the total for the United States. Their growth between 1909 and 1914 was as follows:—

	1914	1909
Establishments	4,775	4,609
Wage-earners	74,373	73,840
Capital	$211,423,167	$167,923,784
Salaries	11,828,691	9,186,243
Wages	33,082,987	28,251,591
Cost of materials	123,430,135	104,015,834
Value of product	212,071,489	180,216,548
Value added by manufacture	88,641,354	76,200,714

In 1914 lumber and timber products still led, having a value of $31,430,208. Flour-mill and grist-mill products were valued at $26,413,574; cottonseed oil and cake $11,414,243. There were nine other industries each with a product valued at over $4,000,000; food preparations; foundry and machine-shop products; general shop construction and repairs by steam railway companies; printing and publishing; hosiery and knit goods; cotton goods; patent medicines and druggists' preparations; fertilizers; bakery products. In 1914 84·6 % of the average number of wage-earners were males over 16 years old, 13·6 % females, and 1·8 % children under 16. In 1909 the respective figures were 85·3 %, 11·3 %, and 3·3 %.

Transportation.—On Jan. 1 1919 the total railway mileage of the state was 4,083 m., or 9·79 m. per 100 sq. m. of territory. The chief railways were: Louisville and Nashville 952 m.; Nashville, Chattanooga and St. Louis 903 m.; Southern railway 891 m.; Tennessee Central 291 m.; Illinois Central 143 miles.

Finance.—The balance in the state Treasury Jan. 1 1918 was $368,818. Receipts for 1918 were $7,954,650 and disbursements $7,481,756, leaving a balance, Dec. 20 1918, of $841,682. On the same date the total bonded debt was $11,481,000. On Dec. 20 1912 the balance in the state Treasury was $317,270 and the bonded debt $15,218,600. The number of all reporting banks, June 30 1920, was 546; aggregate resources $489,162,000; capital stock paid in $35,041,000; individual deposits $312,222,000.

Education.—By an Act of 1909 state normal schools were established in Johnson City, Memphis, Murfreesboro, and (for negroes) at Nashville. In Jan. 1911 Bruce R. Payne (b. 1874) was elected president of the George Peabody College for teachers in Nashville. Later in the year this college was moved from South Nashville to a new site adjoining the campus of Vanderbilt University. Arrangements were made for an interchange of courses of instruction between the two institutions. In 1918 the total school pop. was 790,959. The enrolment in the public schools was 604,633 and the average daily attendance 418,709 (368,888 in 1912). The number of teachers was 11,880, of whom 8,375 were women. In 1919 the compulsory school age was raised from 14 to 16 years.

History.—In 1910 Benjamin W. Hooper (b. 1870) was elected governor, following a serious split in the Democratic party over the prohibition question. He was the only Republican elected to state office, and was the first Republican governor since 1883. He took a strong stand for prohibition. The Democratic Legislature displayed much opposition to the governor, and his inauguration was delayed through lack of a quorum until Jan. 25 1911. The regular Democrats passed a bill depriving the governor of the power of appointing the state board of elections, and raising the number of members from three to seven. The bill was vetoed by the governor, and to prevent its passage over the veto the Republicans and independent Democrats migrated to Alabama, where they remained until acquiescence in the veto was forced. The governor also vetoed a bill giving $500 additional salary to each member of the Legislature, but approved an amended bill reducing the increase to $200. In 1911 the Legislature chose Luke Lea (b.1879) to succeed U.S. Senator James B. Frazier. In 1912 Hooper was renominated for governor and was reëlected over Benton McMillin (b. 1845; governor 1899–1903), the Democratic candidate. Robert Love ("Bob") Taylor (b. 1850), U.S. Senator since 1907, died March 31 1912. He was a representative in Congress 1879–81, governor 1887–91 and 1897–9, and unsuccessful candidate for governor 1910. He was long a picturesque figure in state politics and widely known as a popular lecturer. In the gubernatorial campaign in 1886 his Republican opponent was his own brother Alfred Alexander ("Alf") Taylor (*see* below). They stumped the state together, Bob everywhere winning favour by his stories and folk songs and his "fiddle." As his successor to the Senate the Legislature in 1913 chose John K. Shields (b. 1858), a member of the state Supreme Court since 1902 and Chief Justice since 1910. Another prominent politician, James D. Porter (b. 1828), governor 1875–9, died May 8 1912. In July 1915 the city of Nashville was placed in the hands of a receiver, as the result of the disappearance of the city's cash books covering the period 1908–12, and in 1916 the mayor was removed from office for remissness of duty. In Nov. 1915 the mayor of Memphis, the commissioner of fire and police, and the judge of the municipal court were removed from office for failure to enforce the prohibition law. In the presidential election of 1916 Wilson received 152,955 votes and Hughes 116,257. In 1920 Harding received 219,829 votes and Cox 206,558. For the first time since 1868 the Republican presidential candidate carried the state. A Republican governor also was elected, "Alf" Taylor, brother of the former Democratic governor. Taylor received 229,463 votes as against 182,836 for A. H. Roberts, who had been renominated by the Democrats.

Proposals made by the Legislature to call a constitutional convention were defeated in 1916, 1917 and 1920. In Sept. 1916 a new bridge across the Mississippi at Memphis was opened. An Act prohibiting the manufacture of intoxicating liquor in the state became effective Jan. 1 1910; in Oct. 1913 Gov. Hooper called a special session of the Legislature and secured passage of the so-called nuisance bill, intended to close every saloon in the state, forbidding the sale of intoxicating liquor within four miles of any school; in 1915 provision was made for removal from office of state, county, or city officials who failed to enforce the prohibition law; on Feb. 2 1917 Gov. Rye signed a bill forbidding the importation of liquor into the state. The hours of labour for women were reduced to 58 per week after Jan. 1 1914 and to 57 after Jan. 1 1915. In 1913 for the first time the reporting of accidents was required, wherever persons were employed; provision was made for enforcing the installation of additional fire escapes in factories; and a department of workshop and factory inspection was created. The same year an Act was passed providing "that married women be and are hereby fully emancipated from all disability on account of coverture, and the common law as to the disabilities of married women and its effect on the rights of property of the wife is totally abrogated." On April 1 1913 the Legislature ratified the amendment to the Federal Constitution for popular election of U.S. senators. In 1915 a law was passed providing for mothers' pensions. In 1917 the letting of prison labour to private contractors was prohibited, and an Act was passed forbidding the limiting of the output of coal for increasing the price. The same year a State Budget Commission was created, having as its members the governor, the comptroller, the treasurer, the secretary of state, and the auditor. The wilful setting fire to any woods was made a felony. On Aug. 18 1920 the House by 50 to 46 voted to concur in the Senate resolution (adopted Aug. 13 by five to four), ratifying the proposed amendment to the Federal Constitution, providing for woman suffrage. As the 36th state (out of the 48 in the American Union) to ratify, Tennessee brought the number up to the requisite three-fourths. The contest among the legislators was bitter, and there were attempts to rescind the House's action on constitutional grounds. Governor Roberts, however, on Aug. 24, sent certification of the state's ratification to Secretary of State Colby, who on Aug. 26 proclaimed the Federal amendment for woman suffrage to be in effect.

In the World War Tennessee furnished to the army, navy and marine corps 91,386 men. Contributions to the various war loans were as follows: First Liberty Loan $10,924,800; Second $26,043,650; Third $33,783,250; Fourth $55,867,250; Victory Loan $37,555,450.

Recent governors have been: Malcolm R. Patterson (Dem.), 1907–11; Benjamin W. Hooper (Rep.), 1911–5; Thomas C. Rye (Dem.), 1915–9; A. H. Roberts (Dem.), 1919–21; Alfred A. Taylor (Rep.), 1921– (G. C. S.)

TENNIEL, SIR JOHN (1820–1914), English artist (*see* 26.626), died in London Feb. 25 1914.

TERMONDE (*see* 26.645).—Pop. (1914) 10,138. The town, up to 1906, was still considered one of the five "fortified places" in Belgium, but as the fortifications had not been demolished at the time of the German invasion in 1914 the Belgians decided to defend it. In an early attempt to outflank Antwerp the Germans bombarded and took Termonde, setting fire to it and destroying three-fourths of the town, including the Hôtel de Ville and the spire and vaulting of the 15th Century Gothic church of Notre Dame. The Belgians reoccupied the town on Sept. 10 1914; on Sept. 16 the Germans renewed the bombardment and completed its destruction. Von Beseler's army forced the passage of the Scheldt here on Oct. 7.

Rebuilding was being actively carried on in 1921, together with the reëstablishment of its industries of rope making, bleaching, wire drawing and cotton spinning. The old Butchers' Hall has been transformed into a museum.

TERRY, EDWARD O'CONNOR (1844–1912), English actor (*see* 26.660), died in London April 3 1912.

TERRY, ELLEN ALICIA (1848–), English actress (*see* 26.660), appeared as Mistress Page in *The Merry Wives of Windsor* at His Majesty's theatre, London, in 1911, on the occasion of a special performance to celebrate the coronation of King George V., and made her last regular stage appearance as the Nurse in *Romeo and Juliet*, produced by Miss Doris Keane at the Lyric theatre, London, in 1919. Her sister, MARION TERRY (b. 1856), appeared in H. Vachell's *Fishpingle* at the Haymarket theatre in 1916 and in Tolstoy's *Reparation* at the St. James's theatre in 1919.

TETANUS or LOCKJAW (*see* 26.669).—One of the chief triumphs of preventive medicine during the World War was in the treatment of this disease. The appearance of tetanus in the British army during the early days of the retreat from Mons was so terrifying a phenomenon that immediate steps were taken to cope with it. It had been suggested that the disease might be prevented if a dose of anti-tetanus serum was given as soon as a wound was sustained, for, as is well known, some days elapse before the bacilli, which remain in the wound, are able to secrete sufficient poison to precipitate an attack. The suggestion was carried out and was immediately successful. From that time every wound, no matter how slight, was followed as soon as possible by a dose of anti-tetanic serum. The War Office set up a committee for the study of tetanus (1914–8) under Gen. Sir David Bruce.

Sir David Bruce later presented to the Research Defence Society a paper dealing with the results of his labours. Out of 1,242,000 wounded men who were sent home to England 1,458 cases of tetanus arose, giving a ratio of rather more than 1 per 1,000. How favourably this general figure compares with earlier ones is shown by the fact that in Sept. 1914 the ratio of tetanus cases to wounds was 9 per 1,000. In Oct. 1918 the ratio was 0·5 per 1,000. Thus the incidence of cases of tetanus in Sept. 1914 was 18 times as heavy as in the last month of the war.

A sudden fall in the incidence took place in Nov. 1914 when preventive inoculation, which was introduced about the middle of Oct. 1914, had begun to exercise its beneficial effects. The following figures giving the number of cases of tetanus per 1000 wounded men make this clear:—

	Cases of Tetanus		Cases of Tetanus
Sept. 1914	9	Feb. 1915	1·1
Oct. 1914	7·3	March 1915	0·4
Nov. 1914	2·3	April 1915	2·3
Dec. 1914	1·4	May 1915	0·8
Jan. 1915	0·0	June 1915	0·2

The same experience was met with in the French and German armies. As soon as preventive inoculation with anti-tetanic serum became a universal practice the incidence of tetanus dropped sharply and remained small. Later in the war, June 1917, it was ordered that each wounded man should receive not one inoculation as formerly but four, at intervals of a week. This was on account of the fact that the minimizing effect of the serum passes away rather quickly.

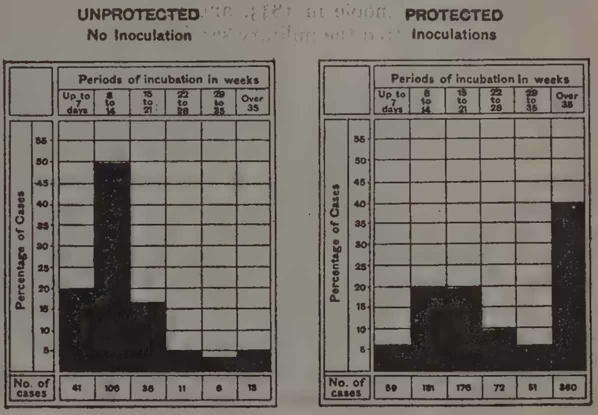

Fig: 1.

The effect is not always to prevent absolutely. But even in those cases in which tetanus does supervene in spite of the inoculations the incubation period is lengthened and the death-rate is lowered. It is well known that, other things being equal, a long incubation period tends to result in a milder attack than a short incubation period, thus any circumstance prolonging the incubation period will also tend to lower the death-rate. The diagram, fig. 1 (after Sir David Bruce), shows clearly how successful were the inoculations in lengthening the incubation period.

In other words only 26·9 % of the inoculated are attacked during the first fortnight, whereas 68·9 % of the uninoculated are attacked. Among the protected 40·0 % have an incubation period of more than 35 days; among the unprotected only 6·5 %. The average incubation among inoculated is 45·5 days, among uninoculated 10·9 days.

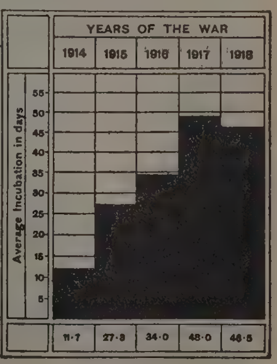

Fig: 2.

Indeed, in each year of the war the incubation period tended to rise, as is shown in the diagram, fig. 2.

Further it was found that the inoculations tended to limit the degree of tetanus, converting what would be generalized cases into local or one-limb cases. The following table illustrates this:—

Tetanus type	Percentages				
	1914	1915	1916	1917	1918
General	98·9	98·6	87·0	76·6	83·5
Local	1·1	1·4	13·0	23·4	16·5

Local tetanus tends to occur in the wounded or injured limb and to be confined to that limb. It is much less severe and far less fatal than the generalized type.

Naturally the death-rate reflected these successes. Among the unprotected and unrecorded the death-rate per cent. was 53·5. Among the protected it was 23·0. The "unrecorded" here undoubtedly include cases which had received a dose. This accounts, in Sir David Bruce's opinion, for the fact that the death-rate is lower than the old pre-serum rate of 85 %.

It is thus evident that the method employed during the war fully justified the hopes which were entertained concerning it, and that an immense amelioration of pain and distress was effected. Indeed, when the terrible character of this disease is recalled it will be seen that preventive inoculation did much to support the *moral* of troops by assuring them of safety, or comparative safety, in the event of exposure to the infection.

See Maj.-Gen. Sir David Bruce, K.C.B., F.R.S., *The Prevention of Tetanus During the Great War by the Use of Anti-tetanic Serum.* (Research Defence Society, Form D2, July 1920.) (R. M. Wi.)

TEWFIK, AHMED, PASHA (1843–), Turkish statesman, was born in Constantinople in 1843, and in 1859 entered the army. In 1870 he quitted the military service and was attached to the translation bureau of the Sublime Porte. He entered the diplomatic service and acted as political agent for the army of the Danube and the Balkans during the Russo-Turkish War (1877–8). He was subsequently attached to the Turkish legation at Athens, where he later became minister. In 1884 he was appointed ambassador to Berlin, but in 1895 was recalled in order to become Minister of Foreign Affairs. After the Young Turk revolution he became grand vizier (1909), but the same year was sent as ambassador to London. In 1912 he was again grand vizier for a brief period. On the close of the World War (Nov. 1918), during which his sympathies were with the Entente, he became grand vizier for the third time, and formed a Government which excluded all members of the Committee of Union and Progress. He resigned in March 1919, but again became head of the Government on the resignation of Damad Ferid Pasha in Oct. 1920.

TEXAS (*see* 26.688).—In 1920 the pop. was 4,663,228, as against 3,896,542 in 1910, an increase of 766,686, or 19·7 %, as against 27·8 % in the preceding decade. The urban pop. (in places of 2,500 or more) was 1,512,689, or 32·4 % of the total as compared with 24·1 % in 1910. The average number of inhabitants per sq. m. increased from 14·8 in 1910 to 17·8 in 1920. The following table shows the growth of the 10 cities in the state having in 1920 a pop. of more than 30,000:—

	1920	1910	Increase per cent.
San Antonio	161,379	96,614	67·0
Dallas	158,976	92,104	72·6
Houston	138,276	78,800	75·4
Fort Worth	106,482	73,312	45·2
El Paso	77,560	39,279	97·4
Galveston	44,255	36,981	19·7
Beaumont	40,422	20,640	95·8
Wichita Falls	40,079	8,200	388·8
Waco	38,500	26,425	45·7
Austin	34,876	29,860	16·8

Agriculture.—The 1910 census gave Texas 417,770 farms, with a total area of 112,435,067 ac., of which 27,360,666 ac. were improved. Owing to the fact that in 1900 the large ranches in the western part of the state were included under farm acreage, there was a decrease in the farm acreage between 1900 and 1910 of 13,361,950 ac., but an increase of 7,784,590 ac. in improved land. By 1910 much of this land had been bought by speculators for sale in small farms and the land was in their hands or in those of purchasers who had not yet begun cultivation, and so was not included under farm acreage. The value of all farm property in 1910 was $2,218,645,164. Advance figures for the 1920 census, subject to correction, gave Texas 435,666 farms. The principal crops for 1920, in the order of acreage (according to estimates of the U.S. Department of Agriculture), were cotton, corn, oats, grain sorghums, wheat, hay, rice, peanuts, sweet potatoes, cowpeas, potatoes, broom corn, barley, sorghum syrup, rye. These crops covered 25,435,000 acres. Their farm value, partly estimated, was $610,787,000. In 1919, at the peak of post-war prices, their value was $1,051,817,000. Texas is a large producer of fruits and vegetables. Ranked according to value of the 22 principal crops produced in the United States, Texas held first place in 1919 and 1920; and first in the value of all crops 1914–20. The average annual yield of corn 1911–9 was 126,600,000 bus.; of wheat 15,300,000 bus.; of cotton 3,600,000 bales. Figures (partly estimates) of the U.S. Department of Agriculture gave Texas Jan. 1 1921 4,500,000 range cattle and 1,184,000 milch cows of the combined value of $213,184,000; horses 1,187,000, valued at $89,000,000; mules just under 800,000, valued at $84,744,000; sheep 3,000,000, $19,335,000; and swine 2,427,000, $28,639,000. In the total value of live stock in 1920 Texas ranked second, between Iowa and Illinois.

Minerals.—The most important mineral products are oil, sulphur, coal and lignite. The first oil in paying quantities was discovered at Corsicana in the central part of the state, in 1894; but keen interest was not aroused until the "Spindle Top" discovery near Beaumont in 1901. Since that time the surface of the state has been covered with leases, and remarkable strikes have been made in a number of places. At the beginning of 1921 production was confined to two general sections—the coast, including mainly Harris and Brazoria counties (Jefferson, Hardin, and Matagorda counties have in the past been good producers); and a region in the northern and north-central part of the state, including chiefly Wichita, Eastland, Comanche, and Stephens counties. The Humble field in Harris county was opened in 1905, Goose Creek in 1911, and Blue Ridge in 1919. The west Columbia field in Brazoria county was also opened in 1919. The Burkburnett field in Wichita county first became important in 1917, Ranger in Eastland county in 1917, and Desdemona and Breckenridge in Comanche and Stephens counties respectively in 1918. Production dropped from 28,000,000 bar. in 1904 to less than 9,000,000 in 1910; rose to 27,644,000 in 1916; 32,413,000 in 1917; 38,750,000 in 1918; 85,312,000 in 1919; and 54,668,000 for the first three-quarters of 1920. Natural gas and natural-gas gasoline were developed as by-products of the oil industry. The value of natural gas marketed in the state rose from $127,000 in 1909 to $5,027,449 in 1918; and natural-gas gasoline in 1918 amounted to 7,326,122 gal., giving Texas fifth rank in that respect. Two sulphur plants in Texas and one in Louisiana were said in 1920 to yield 98 % of all that produced by the United States. One of the Texas plants is at Freeport, near the mouth of the Brazos river, the other is near Matagorda, close to the mouth of the Colorado. The Freeport plant began producing in substantial quantities in 1916, and the next year, under war pressure, delivered 500,000 tons. The Matagorda plant began operation in 1919, producing about 500,000 tons a year. The sulphur lies about 1,000 ft. below the surface and is extracted from wells by "forcing superheated water (and steam) through pipes, dissolving and suspending the sulphur and pumping it back." Bituminous coal production from 1908 to 1918 remained practically stationary, varying from 1,010,000 tons in 1910 to 1,259,000 tons (value $3,140,253) in 1917. The yield in 1919 dropped to 793,000 tons. Lignite is mined principally for state consumption, and the relative backwardness of manufacturing and the competition of other fields keep down the demand. More than 1,000,000 tons were delivered in each of the years 1913–5 and 1917–8. The 1919 yield was 860,000 tons. The value at the mine was slightly under $1 per ton. The original supply was estimated in 1913 at 30,000,000,000 tons, of which about 9,000,000 tons had then been mined. Other minerals of fairly steady yield are silver, worth about $500,000 a year for many years, quicksilver, cement, and clay products. In quicksilver production the Terlingua mine in Brewster county has for more than a decade made Texas second to California only. The highest yield recorded was 10,791 75-lb. flasks in 1917, valued at $1,136,502. Cement production in 1919 was 2,288,000 bar., value $4,176,000; clay products (brick, tile, and pottery) in 1917 were valued at $3,451,806. Salt is produced in fairly steady quantities, and in 1917 yielded 85,181 short tons, with a value of $564,000.

Manufactures.—In 1914 there were 5,084 manufacturing establishments, capitalized at $283,544,000, employing 91,114 persons, and producing an annual value of $361,279,000, of which $108,135,000 was value added by manufacture. The principal industries were those concerned with lumber and timber, cotton-seed products, printing and publishing, oil-refining and allied products, flour and grist milling, and food preparations. The lumber production was 1,350,000,000 ft. for 1918, when Texas ranked sixth in this industry, as it had done in 1910 and 1915.

Commerce.—The noteworthy ports are Sabine, Port Arthur, Orange, and Beaumont in the Sabine district, importing chiefly crude oil, and exporting refined oil and oil products; and Houston, Texas City, Freeport, and Galveston in the Galveston district, which export cotton, grain and sulphur. Houston is a new port, opened in

1915. Its access to the Gulf of Mexico is through the Houston Ship Channel, formed, for the most part, by the widening and deepening of Buffalo bayou. At the beginning of 1921 the controlling depth of the channel was 25 ft. and the width at bottom varied from 110 to 260 feet. The distance from the municipal docks to the Gulf is 54 miles. Unofficial but reasonably dependable figures for 1920 fixed the value of imports through Galveston, including the subsidiary ports of the district, at $30,964,285, and the exports at $627,498,478, making Galveston second to New York as an exporting port, a position which it had held for some years. These figures did not include coastwise traffic. During the year 1,233 vessels cleared for foreign ports, of which 849 were American, 222 British, 29 Norwegian, 26 Italian and 18 Mexican. The bulk of their cargoes was made up of 2,126,717 bales of cotton and 44,726,000 bus. of wheat. Through the coöperation of Galveston county and the Federal Government the Galveston sea-wall was extended and completed in 1920 to a length of 6·3 miles. The total cost of the wall (*see* 11.430) was $4,725,000. The concrete causeway connecting the island with the mainland, 10,642 ft. long, was nearing completion in 1921. The cost was to be $3,750,000, and was to be borne by the county and the railways entering the city. The county and city of Galveston were permitted by state Acts of 1901 and 1903 to apply their state taxes for 17 years to storm defence improvements. In 1917 the privilege was extended for 10 years; and subsequently the same authority was granted to several other maritime counties.

Finance.—The value of all property assessed for state taxation on Aug. 31 1919 was $3,012,819,287. The ratio of assessed value to real value varied from 66⅔% in some cities to 25% in some rural districts. Total receipts of the state treasury for the year were $28,410,724, and total expenditures $27,200,978. On Dec. 29 1920 there were 1,031 state banks, with capital, surplus and undivided profits of $71,768,997. They had individual deposits subject to check of $226,282,045, and time and savings deposits of $35,380,482. On Nov. 15 1920 there were 561 national banks with capital, surplus and undivided profits of $124,633,000; deposits subject to check of $447,898,000; and time and savings deposits of $69,374,000. Of the state banks 176 were members of the Federal Reserve system at the beginning of 1921.

Education.—For 1920 the school pop. (7 to 18 years of age) was 1,271,157; and the number of teachers employed in the public schools was 30,158, of whom 3,515 were negroes. The public schools are maintained by the income from the permanent school fund, by state and local taxes, and by legislative appropriations. The permanent fund consists of lands and interest-bearing notes derived originally from the sale of public lands. In Aug. 1920 it was slightly less than $74,000,000. State taxes for school maintenance are a poll-tax, one-fourth the proceeds of the occupation taxes, and an *ad valorem* tax of 35 cents per $100. The practice of making legislative appropriations to supplement the available school fund began in 1915 with $1,000,000 to aid rural schools. The practice continued, and for the biennium 1919–21 $6,000,000 came from this source for general maintenance. A constitutional amendment adopted in Nov. 1920 removed the limit of 50 cents per $100 which rural districts and unincorporated towns might appropriate for schools. The total available state fund for the year ending Aug. 1921 was $18,564,507, to which should be added nearly $13,000,000 from local taxes. A compulsory attendance law became effective in 1918, requiring, with specified exceptions, the attendance of children between 8 and 14 for at least 100 days each year. The following year a free text-book law went into effect. A law of April 3 1918 requires all public-school work to be conducted in the English language, but does not preclude the teaching of foreign languages.

Administration.—The attorney-general, comptroller, treasurer, and secretary of state head constitutional departments, and all are elective except the last, who is appointed by the governor. The more important statutory departments, in the order of their establishment, are those of the adjutant-general, superintendent of public instruction, state health officer, life insurance and banking commissioner, commissioner of agriculture, Railroad Commission, Live-stock Sanitary Commission, Fire Insurance Commission, the Industrial Accidents Board, the Board of Water Engineers, the Highway Commission, and the Board of Control. All are appointive directly or indirectly by the governor (with approval of the Senate), except the superintendent of public instruction, the commissioner of agriculture, and the Railroad Commission. Their terms vary from two to six years. The Industrial Accidents Board was created in 1913, primarily to administer the Employers' Liability Act. It consists of three members, one of whom must be a wage-earner, one an employer in some industry covered by the Act, and the third a practising attorney. The Board of Water Engineers was created in 1913 to regulate the use of public water for irrigation and all other purposes. The Highway Commission, established in 1917, consists of three members, and is charged with the administration of all highway laws, including that for the registration of motor vehicles. At the close of 1920 there had been completed under its supervision 976 m. of approved highways, costing $5,326,000, of which $1,308,000 was from Federal and $904,000 from state aid. The remainder was paid by the local counties. At the same time contracts were in progress for the construction of 2,039 m. of road at an estimated cost of $23,277,000, of which $8,650,000 was to come from Federal and $1,437,000 from state aid. Federal and state quotas are apportioned in a certain ratio to local expenditure. The Commission reported the registration during 1920 of 427,693 automobiles and trucks and 4,290 other motor vehicles. The state Board of Control, created in 1920, represents an effort to consolidate administration and to coördinate the state budget. It is composed of three members, holding office for six years, one retiring every two years. Its budgets are subject to review and amendment by the Legislature. Departments created during the decade 1910–20, but showing signs of instability, are those of markets and warehouses (including weights and measures) and an Industrial Welfare Commission, created in 1917 and 1919 respectively. The dwindling jurisdiction of the Railroad Commission, suffering from the encroachments of the Interstate Commerce Commission, was somewhat compensated by an Act of March 1919 placing pipe-lines and drilling regulations under its supervision, and another of June 1920 giving it authority over natural-gas production. The Commission reported in Dec. 1918 15,866 m. of railroad in operation, an increase of 1,922 m. since 1910.

History.—After about 1880 prohibition was perhaps the most bitterly contested issue in state politics. A constitutional amendment providing for state-wide prohibition was voted down in 1887 and again in 1911; but was carried in 1919. In the meantime prohibition by local option had made great progress, so that by 1918 more than three-fourths of the area of the state, including the cities of Dallas, Waco and Austin, was dry. The Legislature in March 1918 ratified the Federal amendment, and in April put into effect the "zone" law, prohibiting the sale of liquors within 10 m. of a military, naval, or shipbuilding establishment. In June 1918 statutory state-wide prohibition was established, and doubts of the constitutionality of the Act were ended by the amendment of the next year. The Dean law (July 1919) is one of the most drastic of enforcement Acts. A law of March 26 1918 permitted women to vote in party primaries and nominating conventions; but a constitutional amendment, submitted the next year, to enfranchise women in regular elections, failed. The Legislature nevertheless ratified the Federal Woman Suffrage amendment in July 1919. The effect of the World War is seen in a law of April 2 1918, confining the franchise in primary elections to citizens of the United States; and in another of March 23 1918, amended a year later, providing that assistance should be given at the polls only in the English language and to persons physically unable to write or to those past 60 years of age and unable to read. Aliens could not be debarred from voting in final elections without amendment of the constitution, but preponderance of the Democratic party makes the primary election, in effect, definitive.

The total registration in Texas under the Selective Service Act was 990,522. From the best figures available in July 1921, there were 13,191 voluntary enlistments in the regular army, and 18,573 in the National Guard (transferred to Federal Service in the summer of 1917), and 127,531 inductions (not including officers) under the draft law; while 13,599 men and 6 women served in the regular navy and 4,505 men and 107 women in the naval reserve. The total number in both services, not including all officers, was 177,512. The total losses (officers and men) were 2,722, of whom 1,164 were killed in action, 456 died of wounds, 942 of disease, and 160 from other causes. The wounded numbered 7,331. Figures for the Texan subscription to the First Liberty Loan were not separately available. The eleventh Federal Reserve district, in which the state is included, subscribed $48,948,350. The Texan subscription to the four following loans was $363,273,350. When the Armistice was signed the Emergency Fleet Corp. had wooden ships under construction at Beaumont, Orange and Rockport, and in the Houston Ship Channel. Contracts had been let for 97 hulls and for 18 barges, of which were completed 52 hulls with tonnage of 196,400; and 4 barges aggregating 9,000 tons.

The governors of Texas after 1910 were Oscar Branch Colquitt (Dem.) 1911–5; James E. Ferguson (Dem.) 1915–Sept. 1917; William P. Hobby (Dem.) 1917–21, and Pat M. Neff (Dem.) 1921– . Mr. Ferguson was removed from office by impeachment and was succeeded, *ex officio*, by Lt.-Gov. Hobby, who was subsequently elected for one term, 1919–21.

(E. C. Ba.)

THAYER, ABBOTT HANDERSON (1849–1921), American painter and naturalist (*see* 26.728), died at Dublin, N.H., May 29 1921. During the World War he worked in England on the development of camouflage.

THAYER, WILLIAM ROSCOE (1859–), American writer, was born in Boston, Mass., Jan. 16 1859. He studied at St. Mark's Academy, Concord, N.H., travelled with a private tutor in Europe, and graduated from Harvard in 1881, in the class with Theodore Roosevelt. For several years he was assistant editor of the Philadelphia *Evening Bulletin*, then returned to Harvard, receiving the degree of A.M. in 1886. When the *Harvard Graduates' Magazine* was established in 1892 he was appointed editor, serving until 1915. In 1903, at the International Historical Congress at Rome, he represented both Harvard University and the American Historical Association, and in 1906 was their representative at the Italian Historical Congress in Milan. He was a member of the Harvard Board of Overseers from 1913 to 1919. In 1902 he was made Knight of the Order of the Crown of Italy, and in 1917 Knight of the Order of Saints Maurizio and Lazaro. In 1918 he was elected president of the American Historical Association. He was best known for his works on Italian history, especially *The Dawn of Italian Independence 1814 to 1840*, 2 vols. (1893); *A Short History of Venice* (1905), and *The Life and Times of Cavour*, 2 vols. (1911). His other works include *Italica* (1908); *The Life and Letters of John Hay*, 2 vols. (1915); *Letters of John Holmes* (1917); *Theodore Roosevelt—An Intimate Biography* (1918); *Democracy: Discipline: Peace* (1919, lectures at Brown University); *Volleys From a Non-Combatant* (1919); and *The Art of Biography* (1920, lectures at the university of Virginia).

THEAL, GEORGE McCALL (1837–1919), British historiographer, was born in Canada, where his family had long been settled. When 19 he went to Sierra Leone, removing two years later to Cape Colony, where he became a schoolmaster. He quickly developed an interest in the natives and in the history of the country. In 1877, on behalf of the Government he settled a dispute with the Gaika Kaffirs, and thereafter joined the Cape Civil Service, being attached to the Native Department. Shortly afterwards he was also appointed Keeper of the Archives, and in 1891 was made Colonial Historiographer, which position he held until 1905. Before joining the Civil Service he had published in one volume a *History of South Africa* and the first fruits of his Bantu studies were embodied in *Kaffir Folk Lore* (1882). From the time he obtained access to the Cape archives he devoted himself to research. In 1895 he was commissioned by Cecil Rhodes, then Prime Minister of Cape Colony, to go to Europe, where he stayed several years examining the Portuguese archives at Lisbon, the Dutch archives at The Hague and the British in London. He constantly enlarged and revised his *History* which in its final form was in eleven volumes, the first dealing with ethnography and conditions up to 1505, the others carrying on the story of S. Africa up to 1884. Theal also published official *Records of the Cape Colony, 1793–1827*, in 36 slim volumes, *Records of South East Africa* in nine volumes, and many other works, some in Dutch.

Theal's industry never flagged. He died at Wynberg, Cape Province, on April 17 1919, in the act of correcting the proofs of the last two volumes of his history. The founder of what may be called the Dominions school of historians, he was himself a chronicler rather than an historian. His passion for research brought to light a mass of unknown or forgotten documents of high value, but his narrative is overloaded with details, is essentially domestic, and not always impartial. He lacked the wider vision which sees events in their true perspective. Theal was given the honorary degree of Litt.D. by the Cape University in 1899; he had previously been made an hon. LL.D. of Queen's University, Kingston, Canada.

THERMIT, AND THERMIT WELDING.—Thermit is a mixture of aluminium powder and iron oxide. On ignition the reaction, $8Al+3Fe_3O_4=9Fe+4Al_2O_3$, gives a temperature estimated to be between 2,300° and 2,700°C. The reaction, stated in weights, means that 217 parts of aluminium plus 732 parts magnetite (iron oxide) equals 540 parts steel plus 409 parts slag, or approximately 3 parts of aluminium plus 10 parts of magnetite will produce, on combustion, 7 parts of steel. This steel represents about one-half of the original thermit by weight and one-third by volume.

Thermit was discovered by Dr. Hans Goldschmidt of Essen, Germany, in 1895, while trying to reduce chromium and manganese. Dr. Goldschmidt's principal discovery related to a simple and safe method of ignition, as the action of aluminium when mixed with various oxides, sulphides, and chlorides was well known. Fine aluminium will not burn below the temperature of molten cast iron, and previous experimenters had resorted to heating their mixtures in a crucible. This made the initial temperature so high at the moment of ignition that there was an explosion. Dr. Goldschmidt obtained ignition of a cold mixture by means of a barium-peroxide fuse, which was set off by a storm match. Later magnesium powder or ribbon was used, being set off in the same way. A red-hot iron rod may also be used to set off the magnesium, which in turn ignites the thermit. Dr. Goldschmidt's original American patent No. 615,700 was granted March 16 1897, and related principally to the use of aluminium as a reducing agent for the production of carbon-free metals such as cobalt, chromium, magnesium, tungsten, etc., by what is now known as the aluminothermic process.

Thermit is now used considerably in the foundry for purifying iron and steel in the ladle. For this purpose the thermit is placed in a can on the end of a rod and plunged to the bottom of the molten metal. The intense heat generated tends to liberate many impurities which are carried away in the slag. The principal and better-known use, however, is in welding.

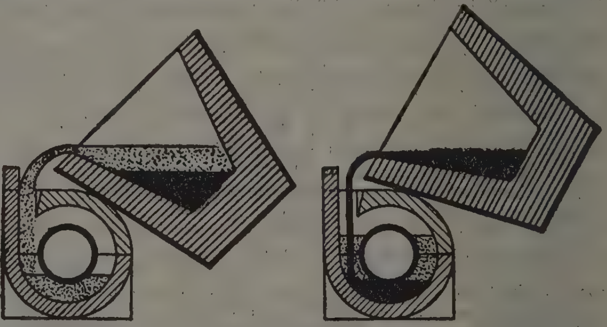

Fig. 1.—Showing the action of Thermit when poured into a pipe welding mould.

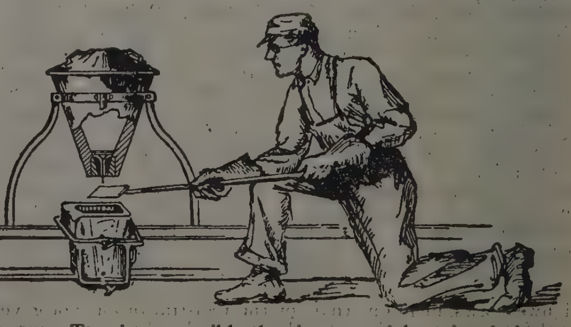

Fig. 2.—Tapping a crucible showing a partial sectional view.

Thermit Welding.—Two methods are employed, known as the plastic and the fusion. The first is used for welding pipe and the latter for solid or large sections. In the plastic method, in which the thermit is used merely for heating purposes, the ends of two pieces of pipe are machined square and clamped in a cast-iron mould with the ends butted together. This mould is in two parts, so arranged that the pipe ends may be forced together when heated. The thermit is placed in an open-top crucible lined with magnesia-tar, and ignited. After the reaction takes place the slag rises to the top of the molten metal, and is first poured into the mould as shown at the left in fig. 1. This slag forms a protective coating on the pipe and on the inside of the mould, and keeps the thermit from melting or burning through. At the right the thermit is shown flowing into the mould and forcing out the bulk of the slag, but leaving a coating as mentioned. When the pipe ends become plastic they are forced together, completing the weld. After cooling the mould is easily knocked off, since the slag coating prevents adhesion. To weld a pipe takes from ¾ to 1½ minutes.

In fusion welding on solid sections, in which the thermit mixture forms a casting holding the parts together, a special V-shaped magnesia-tar-lined crucible, open at the bottom, is used. The hole in the bottom is closed by a headed plug, covered with refractory sand, which may be pushed upward. This crucible is placed over the mould, as shown in fig. 2, the proper amount of thermit put in and ignited. After the reaction, which takes about 35 seconds, the plug in the bottom is pushed up and the molten thermit allowed to run into the mould. In this method great care is taken to keep the slag from contact with the surfaces to be welded, and consequently enough thermit must be used to fill the mould before the slag on top of the melted metal can enter.

FIG. 3.—Sectional view of typical Thermit mould.

A typical mould for heavy sections is shown in fig. 3. In preparing to weld, the surfaces to be joined should be cut or set so as to be ½ in. or more apart. Yellow wax is then built up around the joint in the same shape as the weld is to be. Next the mould box is placed and sand rammed up round the wax, wooden patterns being placed for the pouring gate, riser and preheating gate. The mould is vented, the patterns withdrawn, and a gas or oil flame used to melt out the wax. The heating is continued until the sections to be welded are red-hot. This prevents chilling of the thermit, which is poured in after the preheating gate has been plugged. The steps in making a typical thermit weld on a locomotive frame are graphically shown in fig. 4. Thermit welding is largely used in repairing broken rudder frames, propeller shafts, locomotive frames, steel rolling-mill pinions and other heavy sections, but it cannot be economically used for welding thin sheet metal sections. Welds have been made where from 3,000 to 4,000 lb. of thermit were used.

FIG. 4.—Steps in making a Thermit locomotive frame weld.

For commercial purposes there are now produced three varieties of thermit, known as plain thermit, railroad thermit and cast-iron thermit. The plain thermit is simply a mixture of aluminium and iron oxide, as already given. Railroad thermit is plain thermit with the addition of ⅝ % nickel, 1 % manganese and 15 % mild steel punchings. Cast-iron thermit is plain thermit with the addition of 3 % ferrosilicon and 20 % mild steel punchings. The names of these mixtures indicate their principal uses. (E. VI.)

THOMAS, AUGUSTUS (1859–), American playwright, was born in St. Louis, Mo., Jan. 8 1859. He was educated in the public schools, for several years worked in railway freight offices, and, after serving as special correspondent for various newspapers, became in 1889 editor and proprietor of the Kansas City (Mo.) *Mirror.* As a youth he had been a member of local amateur dramatic companies and had tried his hand at dramatic composition. One of these early pieces, *Editha's Burglar*, based on Mrs. Burnett's story of the same name, was enlarged to a four-act play and presented with great success at the Madison Square theatre in New York in 1889. This led him a little later to devote all his attention to the drama. His play *Alabama* (1891), depicting the old-time South, contributed to the removal of sectional prejudice resulting from the Civil War. His numerous dramas include *In Mizzoura* (1893); *The Hoosier Doctor* (1898, by many considered his best); *Oliver Goldsmith* (1900); *Soldiers of Fortune* (1902); *The Earl of Pawtucket* (1903, highly successful in England); *Mrs. Leffingwell's Boots* (1905); *De Lancey* (1905); *The Embassy Ball* (1905); *The Witching Hour* (1909); *As a Man Thinks* (1912); *Mere Man* (1912); *Indian Summer* (1912).

THOMAS, JAMES HENRY (1878–), English Labour politician, was born at Newport (Mon.), of working-class parents, Oct. 3 1878, and was educated in the board schools. He started at nine years' old as an errand boy, but he soon passed into the service of the Great Western Railway Co., first as engine-cleaner, afterwards becoming fireman and engine-driver. He was elected town councillor of the famous Great Western railway centre, Swindon, and became chairman of the Finance Committee and of the Electricity and Tramways Committee. At an early date he associated himself with the development of the policy of unions among the railway servants. He became president of the A.S.R.S. in 1910, and for many years was secretary of the National Union of Railwaymen, and the most powerful voice in deciding their policy. He was elected to Parliament in the Labour interest for the great Midland railway centre, Derby, in 1910. For some years he took no very prominent part in Parliamentary life, being actively engaged outside in the interests of his railwaymen, who, besides many smaller disputes, came out in a body in the great strike of 1911. Another matter of vast importance in which he was deeply involved, was the organization of the so-called "Triple Alliance" between the unions representing coal-miners, transport workers, and railwaymen. When the war came, he took his stand, with the bulk of the Labour leaders, on the national and patriotic side; but, like many of them, deprecated the introduction of compulsory service, until it should be clear that the necessary men could be got in no other way. In Sept. 1915 he declared in Parliament that trade unionists were absolutely against conscription, that to introduce it might provoke revolution. Nearly every branch of his own railwaymen's organization, he said, had not only passed resolutions against the policy, but had threatened on its introduction to stop work. There were many who questioned at the time the justice of his estimate of the workmen's feelings; and, though he renewed his vehement protest against the first Military Service bill in Jan. 1916, and though the Labour party in conference condemned the measure, there was no difficulty in applying it and no agitation arose for its repeal. Even against the stronger measure of the following April only nine Labour members were found to go into the lobby on the second reading. Throughout the war Mr. Thomas, while securing large advances of wages for the railway servants, used his unique influence with them in composing disputes and preventing any stoppage which should interfere with national interests; and for this considerable service he was made a privy councillor in 1917. It was a bitter blow to him when in Sept. 1918 the rank and file disregarded an agreement which the executive of the National Union of Railwaymen had come to with the Government for an advance of 5s. for adults and 2s.6d. for boys. In spite of this, there was a general strike of railwaymen in S. Wales, and the disturbance spread partially to London and elsewhere; but the courts, on the application of the Board of Trade, prohibited the Union from paying strike pay, and the movement collapsed. In disgust at his advice being disregarded, Mr. Thomas resigned the secretaryship of the Union, but was eventually persuaded, on promises of better discipline, to resume office. He approved of the subsequent decision of the Labour party to sever itself from the Coalition, and to appeal to the electorate in Dec. 1918 for independent support, announcing as his own battle-cry "No more war." He was once more returned at the head of the poll for Derby, and by a huge majority. After the war he became a more prominent figure both in Parliament and in the national life. He made a strong speech in support of the Labour amendment to the Address in 1919, stating that he stood both against Bolshevists and against profiteers. He called upon the Government to deal with the reactionaries in Labour disputes as they would with Bolshevists, and upon the employers to recognize that the working classes could no longer be treated by them as hewers of wood and drawers of water. He welcomed both the bill establishing a Ministry of Health and that establishing a Ministry of Transport; but he warned the House of Commons not to expect cheaper passenger fares and freight charges; the railwaymen would not allow themselves to be sweated for the benefit of the travelling public. But, once again, his real activity was outside. In the disputes in March 1919, between the railwaymen and the Government, he was the chief leader of the men, and at a moment of crisis he flew across to Paris to discuss the question with Mr. Lloyd George, then in attendance at the Peace Conference. The terms which he finally arranged with the Government, involving an approximate addition of over £10,000,000 per annum to the railway expenditure, included a standard week of 48 hours, and a standard wage for that week; for the fixing of the new standard rates of wages negotiations were to be continued. In the last week of Sept. he suddenly announced that a crisis had arisen in these negotiations, and after a futile conference with the Government on Sept. 25, a strike began without further notice on Sept. 26. Neither the community nor the Government was intimidated; and Mr. Thomas used his power for peace, and for a settlement, after ten days, on terms not materially different from what the men might have had at first. His efforts for the men had already, it was calculated, amounted to a permanent annual increase in the railway wage bill of £65,000,000, and an increase of 50%—which in Aug. 1920 became 75%—in passenger fares, and more than 50% in goods rates. In 1920 he and his executive were faced by the difficult problem of the refusal of Irish railwaymen to handle munitions of war; and the only solution he and they could suggest was that the Government should cease to send such munitions and that the Labour party should make an appeal to the Irish people—a solution which ministers, of course, could not accept. His own policy for Ireland was the gift of Dominion Home Rule. During this year he published a book *When Labour Rules*, in which he, speaking, of course, only for himself, depicted the kind of policy which Labour in power would favour—such as the right to work, development of nationalization, better homes, shorter hours, state endowment of motherhood, great extension of university facilities and a national theatre and opera.

THOMPSON, SILVANUS PHILLIPS (1851–1916), English physicist, was born at York June 19 1851, and educated at a school in Yorkshire belonging to the Society of Friends, of which body he was a lifelong member. He went later to the Royal School of Mines, having previously received a B.A. at London University when he was only eighteen. He obtained a B.Sc. from London University in 1875 with high honours and a D.Sc. in 1878, when he became professor of experimental physics in University College, Bristol. There he began his lectures on electrical science which brought him invitations to lecture all over the United Kingdom and made him a power in both the scientific and industrial worlds. In 1881 appeared his *Elementary Lessons in Electricity and Magnetism*, twice reprinted in 1882 and 16 times in the ensuing 12 years. A new edition was called for even as late as 1914. Two other courses of lectures were published in volume form, *Dynamo-Electric Machinery* (1882), and *The Electro-magnet and Electromagnetic Mechanism* (1891). By that time he had removed to London, becoming professor of Physics in the City and Guilds of London Technical College, Finsbury, in 1885 and subsequently its principal. He was elected a fellow of the Royal Society in 1889. In his desire to bring science home to the imperfectly educated he published anonymously *Calculus made Easy* by "F.R.S." (1910), written in colloquial style. His deep interest in religion, which led to his recognition in 1903 as a minister of the Society of Friends, inspired *The Quest of Truth* (1915) and a posthumous work *A Not Impossible Religion* (1918). He also published biographies of Reis, Faraday and Kelvin. He died in London June 12 1916.

See *Silvanus Phillips Thompson, D.Sc., LL.D., F.R.S.*, by his wife and daughter (1920).

THOMSON, SIR JOSEPH JOHN (1856–), British physicist, was born near Manchester Dec. 18 1856 and was educated at Owens College, Manchester, and subsequently at Trinity College, Cambridge, where in 1880 he graduated as second wrangler. In the same year he was elected a fellow of Trinity College, and became second Smith's prizeman. In 1883 he was appointed lecturer in Trinity College, and in the following year Cavendish professor of experimental physics in the university of Cambridge, a position he occupied until his resignation in 1918. He developed a great research laboratory of experimental physics, attracting numerous workers from many countries and colonies; advances were made in the investigation of the conduction of electricity through gases, in the determination of the charge and mass of the electron and in the development of analysis by means of positive rays. He was elected a fellow of the Royal Society in 1884, became president of the Cambridge Philosophical Society in 1894, president of Section A of the British Association in 1896, and president of the Royal Society in 1915. In 1905 he held the professorship of physics in the Royal Institution, London, in addition to his Cambridge professorship. He was knighted in 1908 and awarded the O.M. in 1912. He was the recipient of many British and foreign awards and honours, amongst these being the Royal and Hughes medals of the Royal Society in 1894 and 1902 respectively, the Hodgkins medal of the Smithsonian Institute of Washington in 1902, the Nobel Prize for physics in 1906, enrolment as honorary graduate of many universities, and as honorary fellow of numerous American and continental scientific academies. During the World War he presided over several research committees and he assisted various Government departments in an advisory capacity. In 1918 he was appointed master of Trinity College, Cambridge, and in the following year was elected to a newly established professorship of physics in the Cavendish Laboratory, where he continued to prosecute his researches. In addition to a large number of publications in the *Proceedings of the Royal Society* and the *Philosophical Magazine*, he has published *A Treatise on the Motion of Vortex Rings* (1884); *The Application of Dynamics to Physics and Chemistry* (1886); *Recent Researches in Electricity and Magnetism* (1892); *Elements of the Mathematical Theory of Electricity and Magnetism* (1895, 5th ed. 1921); *The Discharge of Electricity through Gases* (1897); *The Conduction of Electricity through Gases* (1903); and, with Prof. Poynting, a number of text-books upon physics.

THORNE, WILL (1857–), British Labour politician, was born at Birmingham Oct. 8 1857. He started work at the age of seven in a ropeworks, attending the wheel of a rope-spinner for ten hours a day, and on Saturday afternoons and Sunday mornings toiled in a barber's shop. He afterwards became a gas-worker, and in 1889 he helped to found the National Union of Gas Workers and General Labourers, becoming its general secretary. This union (under the title of the National Union of General Workers) had in 1921 a membership of over 600,000. He became a member of the parliamentary committee of the Trades Union Congress in 1894. He was chairman of the Congress in 1912. In 1900 he contested West Ham unsuccessfully in the Labour interest, but in 1906 was elected to Parliament and came to the front as an active and energetic member of his party. At the general election of 1918 he was returned with a majority of 11,505. From 1890 he was a member of the West Ham town council, being elected mayor in 1917. He had been a member of the Social Democratic Federation since 1883.

THORNYCROFT, SIR WILLIAM HAMO (1850–), English sculptor (*see* 26.881), was knighted in 1917. His more recent works include the King Edward memorial at Karachi (1915), and "The Kiss" (1916), now at the Tate Gallery.

THÓRODDSEN, THORVALDR (1855–), Icelandic geographer, was born on the isl. of Flatey, in Breidifjördr, Iceland, June 6 1855, the son of Jón Thóroddsen (*see* 26.881), the poet and novelist. His father's death in 1868 left the family in poor circumstances, but the boy went to school at Reykjavik and in 1875 to the university of Copenhagen, where he studied natural science and geography. In 1876 he was sent to Iceland by the

Danish Government with Prof. Johnstrup to investigate the causes of the eruption which had occurred the previous year at Askja in Dyngjufjöll, and this proved the beginning of a long series of Icelandic explorations. In 1880 he was appointed master at the school of Mödruvellir in northern Iceland, and in 1882, 1883 and 1884 made extensive explorations in the interior. From 1884–6 he travelled in England and on the Continent, and in 1886 was appointed master of the school at Reykjavik. Until 1898 he made a journey of exploration nearly every year, the later expeditions being undertaken from Copenhagen, where he settled in 1895. Reports on his work appeared from time to time in the Danish *Geografisk Tidskrift*, but he also produced various important works, including *Oversigt over de islandske Vulkaners Historie* (1882); *Vulcane im nordöstlichen Island* (1891) and *Landfraedissaga Islands* (1892), a monumental work for which he collected material from the beginning of his career. Thóroddsen received many honours from universities and learned societies, and was awarded the gold medal of the Swedish and the La Roquette medal of the Paris Geographical Society.

THURINGIA (*see* 26.901), a Territory and Free State of the German Reich. Pop. 1,508,025. Area 11,763 sq. kilometres.

On April 30 1920 the union of the Territories Saxe-Weimar-Eisenach, Saxe-Meiningen, Saxe-Altenburg, Saxe-Gotha, Reuss, Schwarzburg-Rudolstadt and Schwarzburg-Sondershausen, in one Territory "Thuringia," was recognized by a law of the German Reich, on the basis of article 18, section 2, of the Constitution of the Reich. The consequence was thereby drawn from the abolition of the dynasties, whose policy of dynastic interests had in former centuries caused the disintegration of central Germany into small states. The removal of these dynasties had been effected in the Thuringian States, as in the Empire in Nov. 1918, by the method of revolution. A noteworthy exception was Schwarzburg-Rudolstadt, where the republic was established by a law enacted conjointly by the sovereign (the Prince of Schwarzburg-Rudolstadt) and the Diet.

The unification of the Thuringian States in one single State was preceded by the union of the two principalities of Reuss into one democratic State of Reuss. On the other hand the personal union of the two States of Coburg and Gotha was dissolved, and each of them went its own way. In all the States of Thuringia elections were instituted after the revolution by the revolutionary Governments for Constituent Assemblies to vote new constitutions. Only in Gotha was the meeting of the new State Assembly delayed. The Council of Workmen and Soldiers in that Territory was subject to Communist influence and endeavoured to establish a Councils (Soviet) Republic. Gotha had to be occupied in Feb. 1919 by detachments of the *Reichswehr* (regular army of the Reich). The workmen replied by a general strike which lasted more than a month. When the Assembly met, the Government of Gotha, which was composed of Independent Socialists, submitted the draft of a constitution which attempted to maintain the system of Councils (Soviets). The work of framing constitutions in all the Thuringian States had meanwhile been anticipated by the movement for forming a unified single State of Thuringia.

Steps in the direction of a union had been taken in some of the States of Thuringia before the revolution, but it was only by the revolution that the path was cleared. All the Thuringian States, with the exception of Saxe-Meiningen and Saxe-Coburg, concluded a "treaty of community" (*Gemeinschaftsvertrag*) in order to prepare for their amalgamation. They formed a kind of federated state with an organ of legislation, the *Volksrat* (Council of the People), and an organ of administration, the *Staatsrat* (State Council). Saxe-Meiningen subsequently joined this Community of States; in Saxe-Coburg a great majority of the citizens decided on Nov. 30 1919 for union with Bavaria, which was ratified by a law of the Reich on April 30 1920. on the basis of article 20 of the Constitution.

The *Volksrat* of Thuringia passed a law on Jan. 28 1920, by which it assumed the right to include within its competence the enactment of a constitution for the State of Thuringia. Nevertheless, there was to be reserved for the first Diet (*Landtag*) of the new State, which was to be elected on the basis of this constitution, the right of making alterations in the constitution within a period of three months by ordinary legislation. On May 12 1920 the provisional constitution voted by the *Volksrat* (Council of the People) was promulgated. On March 11 1921 the newly elected Diet (*Landtag*) ratified this provisional constitution with certain amendments. The birth of the new State dates from May 1 1920, the day on which its establishment was voted by a law of the Reich. While the Thuringian Community of States (*see* above) was organized on the lines of a confederation, what was in contemplation is a single, unified State. For the period of transition, however, the separate Thuringian States continued to exist as communities or territorial regions (*Gebiete*); their former constitutions remained in force as regional regulations (*Gebietssatzungen*). If any disputes should arise between the Territory of Thuringia and the former Thuringian States, the Court of Jurisdiction for State affairs (*Staatsgerichtshof*) was to decide them; for the settlement of financial differences a court of arbitration, half of whose members were to be elected by the Thuringian Diet and half by the popular representative assemblies of the former States concerned, was to be set up.

In accordance with the Constitution of the Reich, Thuringia is a republic with parliamentary government. The Diet, as in the other Territories, consists of a single Chamber elected on a system of proportional representation. It can be dissolved by a popular vote (*Volksentscheid*). The peculiarity of the Thuringian Constitution is that the committees of the Diet may call in experts to supplement their membership. The executive power is in the hands of the Ministry, which is formed on the principle of equal colleagues (*Kollegialprinzip*) and consists partly of members who hold office and partly of members who hold no office and who are designated State Councillors (*Staatsräte*). The members of the Ministry are appointed by the Diet. The president of the Ministry is chosen by the Ministry and is merely its chairman. The Thuringian constitution does not provide for any President of the State. The legislative prerogatives of the Diet are limited, as in the other German Territories, by the right of the people themselves to vote laws; the people can be invited to give their vote (referendum) upon a law which has already been passed and may likewise by their own initiative cause the expression, in a vote, of their will (*Volksbegehren*).

(W. v. B.)

THURSTON, ERNEST TEMPLE (1879–), English novelist, was born at Halesworth, Suffolk, Sept. 23 1879. At the age of 16 he published two volumes of verse. Two years later he published his first novel, *The Apple of Eden* (1897, republished 1905), followed by *Traffic* (1906); *The Evolution of Katherine* (1907); *The Realist* (1907); and two widely differing but very successful novels, *Sally Bishop* (1908) and the *City of Beautiful Nonsense* (1909). His later work includes, on the realistic side, *The Antagonists* (1912) and *Richard Furlong* (1913); and on the sentimental side *The Greatest Wish in the World* (1910); *The Garden of Resurrection* (1911); *Enchantment* (1917) and *The World of Wonderful Reality* (1920). He dramatized his wife's novel, *John Chilcote, M.P.* and one or two of his own, and wrote also, as original plays, *Driven* and *The Cost* (1914), and *The Wandering Jew* (1920).

His wife, KATHERINE CECIL THURSTON (d. 1911), was born at Cork, the daughter of Mr. Paul Madden. She married Mr. Thurston in 1901, but in 1910 her marriage was dissolved on her own petition. She was well known as a writer of novels, notably *The Circle* (1903); *John Chilcote, M.P.* (1904); *The Gambler* (1906) and *The Fly on the Wheel* (1908). The second of these, a study of dual personality, created a considerable stir, both as a novel and as a play. She died at Cork Sept. 6 1911.

TIBET (*see* 26.916).—In Feb. 1910, at the approach of a small Chinese force, which had invaded Tibet under Gen. Chun Ling from Szechuen, the Dalai Lama fled to India and was deposed by imperial decree. In exile at Darjeeling, he appealed for British intervention at Peking, but the British Government declined to dispute the authority of the *de facto* Government in Tibet. At the same time, H.M. Government took occasion to draw the attention of the Government at Peking to the necessity for strict adherence to the terms of the treaty concluded in April 1906, and particularly to the inviolability of the frontiers of Nepal, Bhutan and Sikkim. The last two years of the Manchu dynasty witnessed the restoration of China's effective suzerainty in Tibet from the border marshes to Lhasa, a result chiefly due to the energetic and capable administration directed by Chao Erh-feng, viceroy of Szechuen.

But the province of Szechuen was among the first to be reduced to anarchy by the upheaval of the revolution of 1911, and after the assassination of Chao Erh-feng, the authority of China as suzerain power in Tibet was speedily challenged and overthrown. When the news of the revolution reached Lhasa, the Chinese garrison hastened to throw off its allegiance and following the example of the troops in China, indulged in lawlessness and looting at the expense of the civil population. The latter, led by the ever-restless lamas, took up arms against the invaders and the Chinese garrison found itself cut off from its base and besieged. Desultory fighting continued until the return of the Dalai Lama from India; peace was then (Aug. 1912) locally concluded, under an agreement by which all Chinese troops (with the exception of the Chinese resident's body guard) evacuated the country, departing via India after depositing their arms at Lhasa. By this time China's garrisons had been expelled and her authority overthrown in eastern Tibet by the semi-independent chieftains of that region. The Government of the republic at Peking, desiring to recover the prestige thus lost, authorized the despatch of a punitive expedition, consisting of forces raised by the military governors of Szechuen and Yünnan. The expedition started from Chengtu in July 1912; it had reached and captured Batang in Aug., when, as the result of representations made by Great Britain at Peking (Aug. 19), its advance was stopped and the project subsequently abandoned.

The British Government, in requesting China to abstain from these military operations in Tibet, took the ground that such action constituted a violation of the treaty of 1906. While China's suzerainty was not disputed, the Government could not consent to the forcible assertion of full sovereignty over a State which had established independent treaty relations with Great Britain. The Chinese Government was therefore invited to negotiate a new tripartite agreement defining the status of Tibet. To this communication China replied on Dec. 23; meanwhile the expedition had been countermanded, but desultory fighting continued between Szechuen troops and the Tibetans of the border marshes. The Chinese Government's reply justified its military operations, on the ground that the Tibetan trade regulations of 1906 gave them the right to police the trade marts and protect lines of communication. The republic, it declared, had restored the Dalai Lama to his former position and titles and had no intention of making Tibet a Chinese province, but would scrupulously respect the traditional system of Tibetan Government. Reference was made to the Indian Government's unfriendly act in preventing communication between China and Tibet, via India, and the hope was expressed that this policy might be reconsidered; but the Chinese Government saw no reason for negotiating a new treaty. Before the end of the year, the last of the Chinese forces had been driven out of Tibet, and on Jan. 11 1913 the Dalai Lama proclaimed the independence of the country by concluding a treaty with the Living Buddha (Hutukhtu) of Urga (Outer Mongolia). In April, hostilities were resumed by the military governor of Szechuen; at the same time negotiations with the Dalai Lama were opened by President Yuan Shih-k'ai, who sent a delegate to Chamdo to discuss terms of peace. In May the British Government renewed its proposal for a tripartite conference, which was ultimately accepted. The conference opened at Simla on Oct. 13; Great Britain was represented by Lt.-Col. Sir A. H. M'Mahon, China by Mr. Ivan Chen, and Tibet by her prime minister, Long Chen Shatra.

China's position at this conference was generally negative; while promising not to convert Tibet into a Chinese province, the Peking Government asked that Great Britain should respect China's position as suzerain and undertake not to annex any portion of the country. Great Britain proposed the creation of an Inner and an Outer Tibet, the former to enjoy autonomy, the latter under Chinese control. The Tibetan representative asked for complete independence and frontier rectifications. The result of the subsequent negotiations, which continued till July 1914, was a draft treaty, which the Chinese Government declined to ratify. It provided for Tibetan autonomy and recognized China's position as suzerain power, while limiting the representation of that power to a Resident with a suitable guard at Lhasa. It differentiated between the complete autonomy of Inner and the semi-autonomy of Outer Tibet. China's refusal to ratify this treaty was not due to any definite objection to its specific conditions, but to her unwillingness to accept the geographical definition of the frontiers of Outer Tibet, as proposed at Simla.

After the break-up of the conference, the Chinese Government agreed to the suspension of all hostilities against Tibet pending a renewal of negotiations, and for the next three years a state of armed vigilance was maintained on the Szechuen border. In July 1917, however, a fresh cause of strife occurred in the arrest of two Tibetans by Chinese troops near Chamdo. The Kalong Lama's request for negotiations on the subject was refused, and the armistice was broken by the Chinese general commanding in the marshes, without reference to Peking. In the fighting which ensued, the Tibetans proved victorious; by Feb. 1918 the Chinese garrison at Chamdo was surrounded, and the whole country to the eastward, as far as the right bank of the Yangtse, in the hands of the Tibetans. Chamdo surrendered in April, and the Chinese proposed to negotiate for peace. In July an armistice was arranged, at the instance of Mr. Teichman, the British vice-consul; this was followed by a peace conference at Chamdo, at which it was agreed to suspend hostilities for a year, the Tibetans retiring within the boundary of Derge and the Chinese to Kansue. In Sept. 1919 the Chinese Government at Peking proposed a renewal of the negotiations abandoned at Simla in 1914 and gave evidence of its desire to put an end to hostilities; on the Tibetan side there were also indications of a desire for peace. The situation, however, was (and remained) complicated and difficult by reason of the fact that the authority of the Peking Government was ignored by the usurping provincial satraps of Yünnan and Szechuen, and also because the delimitations of any permanently satisfactory frontier for Outer Tibet presented serious problems, ethnological as well as strategic and political.

See *Blue Book on Anglo-Tibetan Relations* (1910); Sven Hedin, *Trans-Himalaya* (1913); Reginald Farrer, *On the Eaves of the World* (1917); *The China Year Book* (1919). (J. O. P. B.)

TIDES (*see* 26.938).—The present century has seen a marked increase in the interest taken among foreign scientists in the study of the tides, while in Great Britain the subject again received much attention after the close of the World War.

Observation.—The automatic tide gauges which are distributed along the coasts (in Great Britain very irregularly and chiefly according to the needs or caprices of harbour authorities) require much more attention than it has been the custom to pay to them. The errors in both elevation and time of their elevation-time graphs should be determined by independent observation at least once a day, as such errors very easily attain serious dimensions.

But the outstanding scientific need of the present time is for off-shore observations. Not only do the great tidal movements of the ocean remain practically unobserved, but in the middle of the Irish Sea, for example, there is a discrepancy of 40 m. between the co-tidal lines of different authoritative charts.

Off-shore elevations have been recorded by personal soundings (at the Dutch lightships, for example) but a number of attempts have been made to construct a self-registering gauge which, when placed on the bottom of the sea, will give a continuous pressure-time record. From such a record it is of course easy to pass to an elevation-time relation. Up to 1921 the gauge which appeared to have met with most success was that of M. Favé, of the French Marine, and even this had not worked in water of depth greater than 200 metres.

Continuous current observations are required at all depths. A knowledge of currents is of immense importance both commercially and scientifically, and the effect of currents on mines during the World War caused much attention to be paid to them by naval authorities. Tidal currents are oscillatory, but observed currents have, as a rule, a residual drift which is of particular importance in general oceanographical or fishery research.

Surface currents have been measured by floating logs (as for most of the data published by the British Admiralty) but series of observations at frequent intervals, especially of currents below the surface, are usually made by current meters. One of the commonest of these—the Ekman meter—registers the mean speed and direction of the current during the interval of time it is in operation, the former by a small propeller actuating a revolution counting apparatus and the latter by a vane attached to an apparatus dropping shot into sectorial boxes on a compass card. It has thus to be hauled up to the surface for each reading. Continuous recording instruments are much needed and though some have been invented they do not appear to have been much used. Owing chiefly to the trouble of keeping a meter fixed relatively to the bottom, the accurate measurement of currents is a matter of great difficulty. Other data for residual currents or drifts are given by observations of weighted bottles or other forms of floating bodies, or by instruments so contrived as to float near the sea bottom.

General Distribution of Off-shore Tides.—Much attention is now paid to the "amphidromic points," at which there is no rise and fall of the water and out from which the co-tidal lines radiate. Harris' charts of co-tidal lines contain a number of these points and so does the new chart of R. Sterneck (*Sitzb. d. Akad. Wissensch., Wien*, 129, 1920), which is based on all available data.

All recent charts of co-tidal lines for the North Sea agree in placing an amphidromic point in the southern region, and one of the services of the Favé gauge has been to give fresh observational verification of its existence (*Comptes Rendus*, 151, p. 803, 1910).

Dynamical Theory of the Tides.—As regards the tidal dynamics of completely defined bodies of water, the only basins which had yielded to mathematical treatment up to 1914 were those of a flat circular sea, the depth of which was a function only of the distance from the centre, and an ocean covering the whole globe with the depth a function only of the latitude. The details for zonal basins of uniform depth have since been worked out by G. R. Goldsbrough (*Proc. London Math. Soc.*, 14, 1914; 15, 1915).

Two attempts have been made, however, to bring some of the latest results of pure mathematics to bear on the general problem. In 1910 Poincaré published his transformation of the dynamical equations from the differential to the integral form (*Leçons de Mécanique Céleste*, t. 3). The theory of integral equations has grown up almost entirely since 1900; its results are perfectly general and are stated explicitly in terms of direct operations. But in the case of tidal problems the arithmetical labour necessary to carry out these operations is so prodigious as to prove quite prohibitive even for the reproduction of known solutions: nevertheless, the theory is valuable for the establishment of existences.

Utilizing these existence-theorems J. Proudman (*Proc. London Math. Soc.*, 18, 1917) has been able to specify the tidal state of an ocean by means of an infinite number of coördinates of the Lagrangian type, and then to transform the differential equations into an infinite set of linear algebraic equations. This has afforded a real prospect that the number of geometrically simple basins for which the tidal dynamics is completely known, may be increased.

The explanation, on dynamical principles, of the observed features of tides in small seas has been considerably advanced, chiefly by A. Defant and R. Sterneck. See *Denkschr. d. Akad. Wissensch., Wien*, 96 (1919). *Sitzungsberichte*, 123 (1914), 124 (1915), 129 (1902). The method of treatment only applies to elongated bodies of water and applications have been made to the Red Sea, the Persian Gulf, the English Channel, the Irish Sea and the Adriatic Sea. The motion is assumed to consist of a longitudinal oscillation sustained chiefly by the tides outside, with a transverse surface gradient sustained by the longitudinal current through the earth's rotation.

Other parts of the dynamical theory which have undergone development are those relating to slowly rotating seas and oceans, limiting forms of long period tides and the diffraction of tidal waves. See Rayleigh, *Proc. Roy. Soc.* (A) 82 (1909); J. Proudman, *Proc. London Math. Soc.*, 12 (1913), 13 (1913), 14 (1914). In this connexion it may be mentioned that there is an erroneous statement in 26.957 §34, to the effect that the existence in the ocean of continental barriers would have the same effect as that attributed by Laplace to friction. In the actual oceans limiting forms of long period tides are possible which do not take the "equilibrium" values.

Harmonic Analysis.—From 1883 up to the present time the standard harmonic development of the generating potential has been that of G. H. Darwin. Quite recently A. T. Doodson has made a new development, working to a much higher order of approximation than Darwin, and has found that there is a very large number of other constituents which, while certainly being smaller than those of Darwin, are not very much smaller, and in their aggregate may be important. In other words, the convergence of the series of constituents is not so rapid as has been assumed.

A corresponding state of affairs exists with regard to *over tides and compound tides*. For certain British stations A. T. Doodson, being led by dynamical principles, has found it possible to obtain a practically complete representation of the quarter diurnal tides, but it involves many more harmonic constituents than have ever been sought for by the customary methods. This representation is susceptible of very simple algebraic statement and numerical application but cannot be used on the existing predicting machines.

The present state of analysis is not satisfactory. *The harmonic constants* do not represent completely the records analysed: for certain British stations the discrepancy may have a quarter-diurnal range of one foot and a semidiurnal range of one foot.

J. Proudman (*British Assoc. Report*, 1920, p. 323) has given an account of British work on harmonic analysis with a bibliography and lists of analyses made.

Tide Tables cannot be regarded as satisfactory even for such practical purposes as docking large vessels or navigating over shallows, while for a hopeful study of meteorological effects they are almost useless. The main deficiency appears to be one of analysis of records; for others, see A. T. Doodson, *Brit. Assoc. Report*, 1920, p. 321.

When the astronomical tides can be predicted with the same degree of accuracy as the resultant tides can be observed, there appears to be no reason why short date predictions of meteorological tides—obviously of great importance—should not be attempted.

Atmospheric Pressure and Wind.—The effects of meteorological influences on the tides have been much studied, especially by the Scandinavians. As regards the relative importance of atmospheric pressure and wind, a general conclusion appears to be that at a station in the immediate neighbourhood of a wide expanse of deep ocean, the direct pressure effect predominates, whereas at a station in a landlocked and shallow sea, the wind effect predominates. The detailed study of these effects is rendered very difficult by the uncertainties in the predictions of astronomical tides, and most investigations have dealt with mean effects over long intervals of time. There is much literature on the subject: see for example D. la Cour, *Danske Meteorologiske Institut, Meddelelser*, 1 (1913), 4 (1917); R. Witting, *Fennia* 39, 5 (Helsingfors 1918). The 1917 memoir of la Cour is a detailed study of the effects of a storm.

Friction.—If tidal motion were everywhere non-turbulent then the amount of friction in the oceans would be quite insufficient to account for the outstanding discrepancy between theory and observation in the motion of the moon. See R. O. Street, *Proc. Roy. Soc.* (A) 93 (1917). But the motion associated with large tides in shallow seas is undoubtedly turbulent and though this has long been recognized it is only recently that numerical estimates of its amount have been made. See G. I. Taylor, *Phil. Trans.* (A), 220 (1920). H. Jeffreys, *ibid* 221 (1920), concludes that the total amount of friction is just about sufficient to account for the discrepancy mentioned. He takes the chief contributing areas to be Bering Sea, the Yellow Sea, Malacca Strait and the American N.W. Passage.

History and Bibliography.—To the list of outstanding names in the history of the theory of the tides should be added those of G. H. Darwin and H. Lamb. The chief contributions of the former were his elaboration of the methods of harmonic analysis and his far-reaching cosmogonical deductions as to the consequences of tidal friction. The chief contribution of the latter is in connexion with steady motions and the discrimination of free oscillations in the general dynamical theory. Additions to the list of books on tides are R. A. Harris, *Manual of Tides* v. (1907); H. Poincaré, *Leçons de Mécanique Céleste*, t. 3 (1910) and O. Krümmel, *Handbuch der Ozeanographie*, B. 2, C. 3 (1911). (J. P.*)

TIENTSIN, China (*see* 26.963).—After the Chinese revolution of 1911 the political and social importance of Tientsin considerably increased, inasmuch as it became an unofficial place of residence, and often of refuge, for high Chinese officials in times of trouble, and a neutral ground convenient for the conferences of the northern military governors. The number of Chinese residents in the Foreign Concessions steadily increased after 1912 and building operations continued unabated. The World War naturally led to a greatly increased demand in most branches of the port's export trade, so that, in spite of floods, famines and brigandage, business was very prosperous after 1915. Local industrial enterprise was stimulated by the curtailment of imports from Europe and a lack of shipping facilities. In 1919 it received a fresh impetus from the boycott of Japanese goods, with the result that many new factories were established for the manufacture of goods heretofore imported.

The city produces cotton yarn in steadily increasing quantities, seed and groundnut oils, canvas, leather, soap, candles and numerous articles for domestic consumption; its chief exports during the war were furs and skins, wool, bristles, strawbraid, carpets and prepared eggs. The value of the export trade in 1919 was 71 million taels, as against 51 millions in 1918, and 42 millions in 1917. Tientsin's prosperous growth was indicated by the opening of four new Chinese banks in 1919. The coal trade, from the Kailan Mines in Chihli and the Peking Syndicates in Honan, has greatly increased since the adoption of the system of Anglo-Chinese coöperative working.

In Sept. 1917 the Foreign Concessions and the trade of the port suffered severely from floods, which burst the banks of the Grand Canal and inundated all the plain surrounding the city. Before normal conditions could be restored in the British, French and Japanese Concessions, the municipal councils were compelled to surround them with dikes and pump out the water. This flood also produced a shoaling of the river bar at Taku, with results seriously prejudicial to the trade of the port. With a view to preventive and remedial measures, a Joint Commission for the improvement of waterways in Chihli was formed in 1918, upon the recommendation of the Haiho Conservancy Board, under the presidency of Hsiung Hsi-ling, with the assistance of European engineers and experts; in addition to the local work of river conservancy, this Board is charged to report on ways and means for restoring the navigability of the Grand Canal between Tientsin and the Yellow river, which has been for many years impracticable at certain seasons.

The foreign garrisons (American, British, French, German, Japanese and Russian) stationed at and around Tientsin under the terms of the Peace Protocol of 1901, for the protection of railway communication between Peking and the sea, were considerably increased after the outbreak of the revolution in 1911. At the end of 1913 their combined forces at Tientsin amounted to 6,000 men; but in the autumn of 1914 most of those belonging to the belligerent Powers were withdrawn. In March 1917 the Chinese Government took over charge of the German Concession; on Aug. 14 the Austrians were similarly dispossessed. Since then, both Concessions have been administered, in accordance with preëxisting municipal regulations, by the Chinese authorities. (J. O. P. B.)

TILAK, BAL GANGADHAR (1856–1920), Indian nationalist leader and orientalist, was born July 23 1856, at Ratnagiri, where his father, a Chitpavan Brahman, was an educational officer. At the Deccan College, Poona, he graduated in arts with honours in 1876, and took the LL.B. degree in 1879. In the following year he took the lead in providing secondary and higher education in Poona under Indian direction by founding an English school and the famous Fergusson College. Tilak conducted law classes till 1890, by which time he had become the sole proprietor as well as the editor of the two weekly papers, the *Mahratta* (in English) and the *Kesari* ("Lion" in Mahratti) which he and his friends had founded in 1880. These were the chief printed media of his anti-Government propaganda; but he took every advantage of public activities, such as membership of the local municipality and the organizing of Shivaji and Ganpati celebrations, to work upon the prejudices and passions both of the masses and of the educated minority. Identifying himself with Brahmanical orthodoxy he bitterly opposed social reforms. His violent condemnation in 1897 of the plague prevention regulations was followed by the assassination of the local plague commissioner (Mr. Rand) and a young British officer driving with him at the time. Convicted of sedition, he was sentenced to 18 months' rigorous imprisonment, but he was released within a year under pledges of good behaviour. In prison he pursued the Vedic studies which had already given him a place in oriental scholarship. His elaborate paper on "The Orion, or Researches into the Antiquity of the Vedas," read at the International Congress of Orientalists, London 1892 (published at Poona, 1893), was followed in 1903 by his "Arctic Home in the Vedas" —expounding a theory of extremely remote Aryan origins which has failed to secure the acceptance of other scholars. Tilak was twice elected to the Bombay Legislature for triennial terms. Again indicted for sedition in June 1908, he was sentenced by a Parsi judge (Mr. Justice Davar) to six years' transportation, afterwards commuted on account of age and health to simple imprisonment at Mandalay. On release in 1914 he actively promoted the home-rule campaign, and at last succeeded, after the death in 1915 of G. K. Gokhale, in his prolonged struggle to secure for his party control of the Indian National Congress. A libel suit he instituted in London against Sir Valentine Chirol for statements made in *Indian Unrest* (1910) ended in a verdict for the defendant with costs (Feb. 21 1919). On returning to India he refrained from definite association with the non-co-operation cult. His death in Bombay, Aug. 1 1920, was followed by demonstrations of mourning throughout India, showing his remarkable hold on the popular mind.

Tilak's formative part in the cult of Indian unrest is shown in the *Report of the Rowlatt Sedition Committee*, 1918. His speeches are collected with an appreciation by Aurobinda Ghose in *Lokamanaya B. G. Tilak*, Madras, 2nd edition, 1920. (F. H. Br.)

TILLETT, BENJAMIN (1860–), British Labour politician, was born at Bristol, Sept. 11 1860. He started work in a brickyard at eight years and was a "Risley" boy for two years. At 12 years he served for six months on a fishing smack, was afterwards apprenticed to a bootmaker and then joined the Royal Navy. He was invalided out of the navy and made several voyages in merchant ships. He then settled at the London Docks, and organized the Dockers' Union of which he became general secretary in June 1887, taking a prominent part in the dock strike of 1889. He was subsequently one of the pioneer organizers of the General Federation of Trades, National Transport Workers' Federation, National Federation of General Workers, International Transport Federation, and the Labour party. For many years he was an alderman on the L.C.C. After standing for Parliament unsuccessfully four times, he was elected in 1917 as Labour member for N. Salford. In 1910 he published *A Brief History of the Dockers' Union*, commemorating the 1889 dockers' strike, and in 1911 *A History of the London Transport Workers' Strike.*

TIME (*see* 26.983).—The progress of wireless telegraphy has greatly simplified accurate determination of Greenwich time and consequently of longitude.

Determination of Time.—The chief difficulty in determining local time from observations of the altitudes of celestial objects is that of getting a satisfactory horizon. In the case of airships the view of the horizon is much interfered with by cloud, and the dip of the horizon is a more important and uncertain factor than in ordinary navigation at sea. When the airship R34 crossed the Atlantic in 1919 observations were made from a "cloud horizon" the height of which could not be known with accuracy. During the World War several sextants were designed in which the use of a pendulum or level enables the altitude of celestial objects to be determined without reference to the horizon, but they have not come into general use.

For the determination of Greenwich time at sea astronomical methods have been practically abandoned, and extreme accuracy in chronometers is no longer necessary. Signals are sent out daily at specific instants of Greenwich mean time from such stations as the Eiffel Tower, Lyons, Nauen, Annapolis, Darien, Honolulu and Cape Town, and it should be possible to pick up one or more of these signals at any point on the earth's surface. The time shown by a chronometer can, therefore, be checked by wireless at least once a day, and since the astronomical observations made by a navigator for ascertaining local time are accurate only to 1′ of arc, corresponding to 4 sec. of time, a chronometer which can be relied on to within 4 sec. a day is sufficient. This is far within the limit of modern chronometers.

A new method of determining positions on the earth's surface, independently of time altogether, has recently become possible, although it is still far short of attaining the desired degree of accuracy. The direction of a wireless transmitting station can now be determined by the receiving station to within about 3°, and if the directions of two transmitting stations are known the position of the receiver can be found. Accuracy is of course greatest where the two transmitting stations subtend a wide angle, and the best results are obtained when the wireless waves can be sent out from the point, the position of which is to be determined and the directions found by two land stations. The method promises to be of great service in aerial navigation, and for ships near the coast in foggy weather. In the beginning of 1921 nine wireless direction stations in the British Isles, sixteen in France, four in Germany and one in Italy were available for navigational purposes.

The position of buoys in the North Sea has been determined by the time required by sound to reach special receiving apparatus at fixed points on the coast. This method was introduced soon after the Armistice in Nov. 1918, but its application is limited to distances of 100 or at most 200 miles.

Accurate Determinations of Time and Longitude.—The precision of time observations has been greatly increased by the use of the self-registering micrometer in observing transits. With this micrometer the personality of different observers is reduced to $0^s.01$ to $0^s.02$, so that the exchange of observers for longitude determinations is only necessary in work of the very highest accuracy. The sending and receiving of rhythmic wireless time signals has reached such a degree of accuracy that the clocks at distant stations can be compared to $0^s.01$ or less. It should therefore be a simple matter to make accurate longitude determinations. The value of the new methods was fully established in the determination of the difference of longitude between Paris and Washington in 1913–4, when the result obtained was $5^h 17^m 36^s.653 \pm {}^s.003$.

Standard Time.—The use of a system of zones of standard time has been considerably extended.

Greenwich time is now (1921) adopted in the British Isles, Spain, Portugal, Belgium, France and the Faroe Islands. Mid-European time (1 h. fast on Greenwich) is used in Germany, Denmark, Italy, Switzerland, Norway, Sweden, Austria and the western parts of the Balkan peninsula; and E. European time (2 h. fast on Greenwich) in the eastern parts of the Balkan peninsula, including Greece. Time in Iceland is 1 h. slow on Greenwich. Russia still adheres to Pulkovo (Pulkowa) time, 2 h. 1 min. fast on Greenwich. Divisions of less than an hour are used in several British colonies. Standard time in the E. African Protectorate is 2 h. 30 min., in India 5 h. 30 min., in Indo-China 6 h. 30 min., in S. Australia 9 h. 30 min., in New Zealand 11 h. 30 min. fast; in British Guiana 3 h. 45 min., the Sandwich Is. 10 h. 30 min., Samoa 11 h. 30 min. slow. In all other countries adopting standard time the most suitable whole hour is employed. The standard zones in Brazil are from 2 to 5 h. slow on Greenwich. Uruguay, the Argentine Republic and Siam adopted standard time in 1920.

In the United States in 1918 to the four zones already established (1883) was added a fifth for Alaska alone. Standard time for this zone is based on 150° W. longitude. Standard time in the four other zones is based, as from the beginning, on the 75th, 90th, 105th, and 120th meridians. The marking of the limits of the various zones lies with the Interstate Commerce Commission, and they may be changed at its discretion. The first four zones differ from each other 1 h. in standard time; the fifth differs from the fourth by 2 hours. The first zone is 5 h. slow on Greenwich.

Until recently no definite time system was employed at sea, each ship adopting the local time corresponding to its position at a certain instant, usually noon. In 1919 a system of hour zones similar to that used on land, previously adopted in the French and Italian navies, came into official use in the British navy, a change which will greatly facilitate the interpretation of entries in ships' logs. The "zone description" of each zone is denoted by a positive or negative number equal to the number of hours slow or fast on Greenwich.

The central zone or Zone O lies between long. 7½° E. and long. 7½° W.: the zones to E. of this are numbered −1, −2 . . . −12, and those to W. +1, +2. . . +12. Zone 12 is divided centrally by the 180th meridian (the date line) and the + or − prefixes are used in its two halves. Near land the boundaries between the zones are modified so as to agree with the time used ashore.

Civil and Astronomical Times.—The civil day reckoned from mean midnight, instead of the astronomical day reckoned from mean noon, is to be adopted in the *Nautical Almanac* in 1925, and a similar change has been decided on for the *Connaissance de Temps* and the *American Ephemeris.* The same course will probably be followed by astronomers, but some confusion may arise if the old expression "Greenwich Mean Time" is employed in a new sense.

TINAYRE, [MARGUERITE SUZANNE] MARCELLE (1872–), French novelist, was born at Tulle, Corrèze, in 1872. She was educated at Bordeaux and Paris, and in 1889 married the painter Julien Tinayre. Her earliest novel was *Avant l' Amour* (1897); but the one by which she is best known is *La Maison du Péché* (1902). Her later works include *La Rebelle* (1905); *La Consolatrice* (1907); *Madeleine au Miroir* (1912); *L'Ombre de l'Amour* (1910); *La Douceur de Vivre* (1911); and *Le Départ; Août, 1914* (1915). She also published in 1910 a book of travels, *Notes d'une Voyageuse en Turquie.*

TIRE (*see* 26.1006).—The modern motor vehicle (*see* MOTOR VEHICLES) would not be possible without some cushioning or shock-absorbing medium at the periphery of its wheels. India rubber, properly fashioned and fabricated with metals and fabrics into tires, plays an essential part in providing this necessary cushion. Structurally, tires are divided into two main classes: solid rubber and pneumatic. The cushioning properties of solid tires are due to the elasticity of the rubber and the design of the tread, while in the pneumatic type compressed air is the cushioning medium; the rubber tire in this case serving as a flexible, yielding container for the compressed air. In both classes the various types are made in a progression of sizes, varying in outside diameter to give the proper road clearance, and in width to accommodate properly the weight the tires have to support.

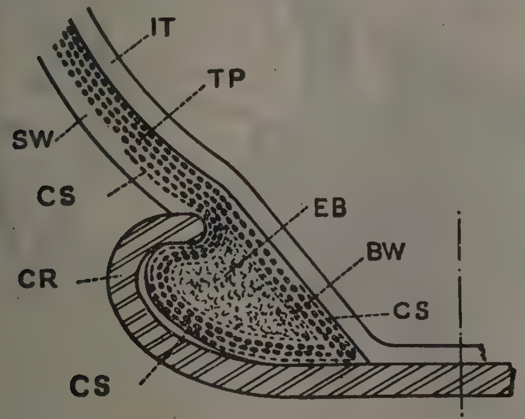

FIG. 1.

History from 1910 to 1921.—This period opened with the motor vehicle industry served by clincher or beaded edge pneumatic tires (fig. 1) of square woven fabric not larger than 5½ in. in section, suitable for use on passenger cars only, and giving 3,000 to 4,000 m. service. The trend of tire development had only recently settled on this clincher type as the most logical of the many inventions, and the shortcomings of the product were varied and numerous. Americans, following British design, were especially unfortunate in having a great deal of premature failure due to "rim cutting." This clincher type was also difficult to apply to the rims in the larger sizes, and troublesome security bolts were necessary to keep the tire from creeping around the rim. Progress in tire development has been influenced by three considerations: first, the method of attachment to the rim; second, increase in the durability of the tire; and third, the development of new types of tires for new fields of usefulness. The principle of the Dunlop-Welch wired-on bicycle tire had been tried experimentally in motor vehicle tires by using a bulky inextensible wire bead fastened to the wheel rim with "straight-side" bolted-on flanges. This straight-side tire idea first became practical for motor vehicle use in 1907 when an American manufacturer offered to the American public in perfected form his "detachable" straight-side rim and tire. Its progress was slow because of competitive hindrances, but by 1910 the detachable rim had become so much appreciated that the clincher tire manufacturers were obliged to furnish some sort of a detachable tire. The result was the "quick-detachable" (Q.D. clincher), a tire fitting a detachable clincher rim and having its beads shaped like the regular soft bead clincher but with an inextensible wire bead core like the straight-side tire. During this period of development the Q.D. clincher served admirably as a transition type.

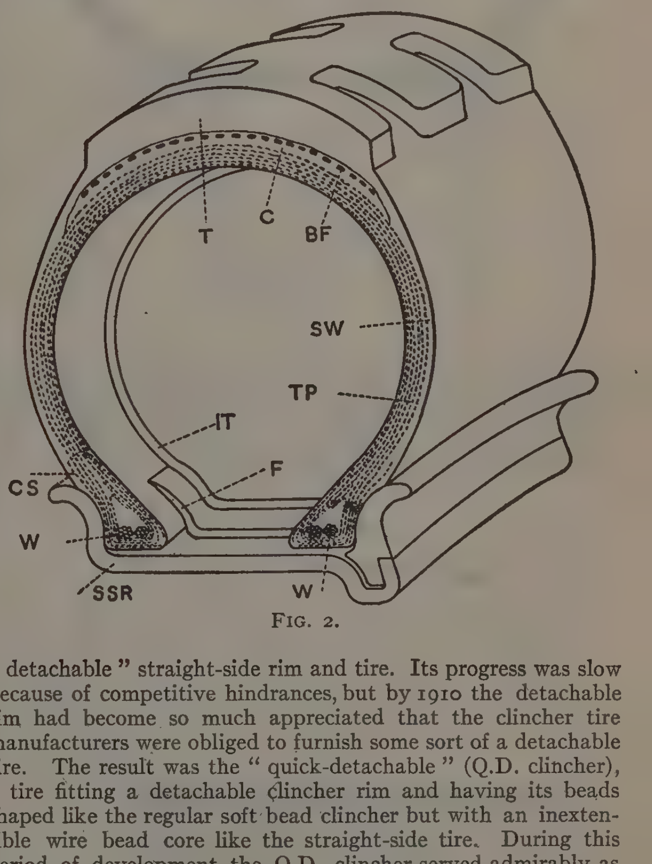

FIG. 2.

The merits of the straight-side (fig. 2), however, gradually made it more popular than the Q.D. clincher, with the result that the last Q.D. clincher rims were made in 1916. In the meantime the European demand continued to be for the clincher type exclusively, while except in the Ford sizes, they were discontinued in American production. American army vehicles and motor vehicles exported on straight-side tires have recently opened a market for straight-side in other countries. The year 1921 found the situation as follows: bicycles were fitted with single tube tires in America and wired-on tires in Europe.

Motorcycles were fitted with clincher tires both in America and Europe, and aeroplanes with either clinchers (fig. 3) or wired-on according to the demand. Passenger cars were fitted with European Standard clincher tires for European productions. American small cars took $3\frac{1}{2}$-in. American Standard clincher tires, while cars using larger than $3\frac{1}{2}$-in. took American Standard straight-side tires. All American "motor trucks" using pneumatics operated on straight-side tires, and for solid tire equipment took pressed-on, channel base tires (fig. 4).

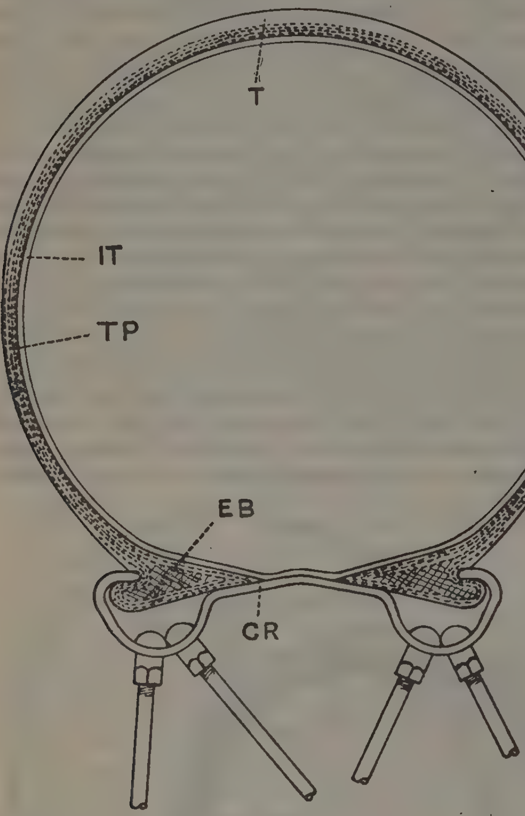

FIG. 3.

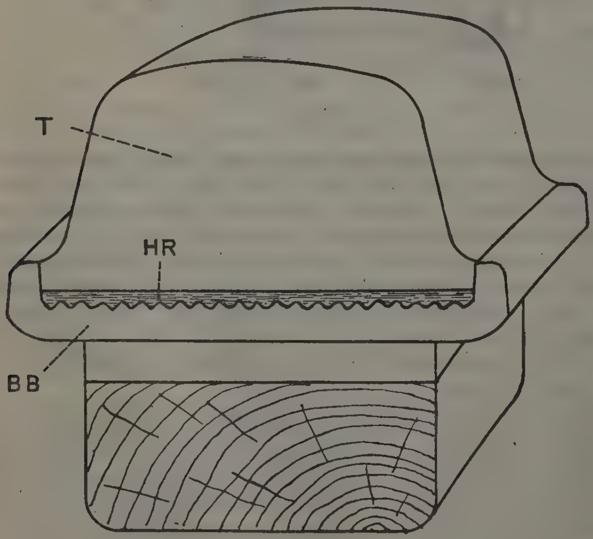

FIG. 4.

European "lorries" were fitted with the typical English band tire (fig. 5). Progress in details of design, materials, and methods of manufacture was very gradual, the general idea being always to build a "balanced" tire, that is, one in which all parts were equally durable. There are practically no formulae or theories on tire design (except the rubber compound formulae) of value to the tire manufacturer; whatever good qualities any particular make of tire embodies are the result of persistent and constant experimentation, combined with the policy of the individual company controlling the standard of quality which it desires to offer to the public. The square woven tires of 1920 averaged 5,000 to 6,000 m. of service. There was one outstanding development during the period 1910–20, namely, the "cord construction." The cord idea was old, having been used in bicycle tires in the 'nineties, but the "square woven tire duck" appeared to be more practical for motor vehicle tires.

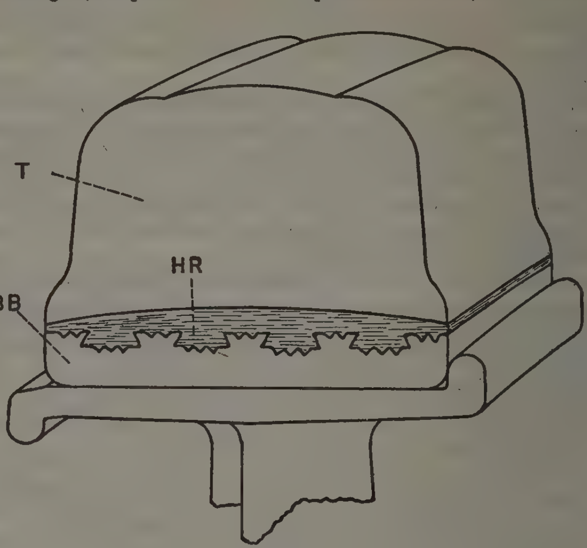

FIG. 5.

About 1912 electric automobiles in America created a demand for "power saver" tires to which the tire makers responded by offering special casings of cord fabric structure for which exceptional resiliency and lack of internal friction were claimed. Not at all durable at first, as they were gradually perfected the leaders of the industry became convinced that this was to be the quality tire of the future (fig. 6).

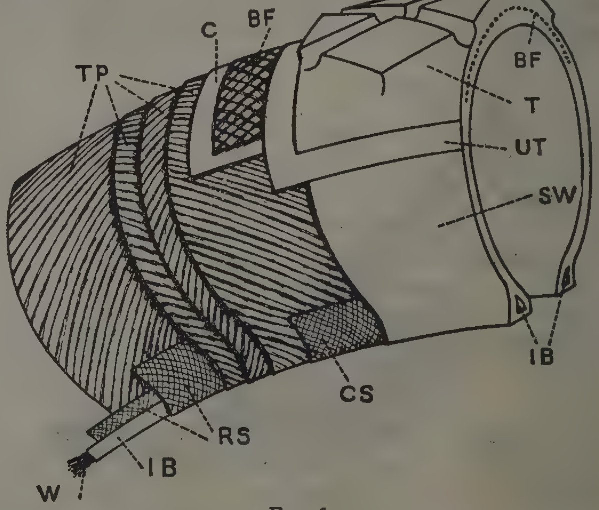

FIG. 6.

Ply separation and fabric breaks in cord tires are effectively prevented because the cords, being completely insulated from each other, provide a flexibility of the "carcass" without chafing, that greatly reduces injury from under-inflation and overloading. Development in the two-ply "cable" cord construction and the "multi-ply" construction paralleled each other. In 1920 the merits of the multi-ply construction had prevailed to such an extent that the "cable" cord was no longer made. After the World War European tire manufacturers began to duplicate American multi-ply cord construction in their millimeter beaded edge sizes. The cord tires of 1920 averaged 7,000 to 8,000 m. of service. Durability was also materially improved by increasing the cross-section size of the tires. In 1920 practically all American straight-side cord tires were made 10% over the nominal size. Also the tire manufactures gradually succeeded by persistent educational work, in getting car manufacturers to fit tires adequate for the loads to be carried. During this decade a new use was developed for pneumatic tires, namely their application to motor trucks up to $3\frac{1}{2}$ tons capacity. The movement made very little progress from 1910 to 1915. "Dual" (or twin), square-woven fabric tires in passenger car sizes were first tried. Then square-woven fabric tires of 8-in. and 9-in. sections were employed with results encouraging enough to justify putting a limited number on the market. By 1916 automobile cord tire construction had been mastered sufficiently for trial in the truck sizes. Success with 6-in., 7-in. and 8-in. sections immediately demonstrated the superiority of the cord construction and was followed by regular demand from the public. The 9-in. and 10-in. sections were used to some extent but their future was in 1921 uncertain. The typical solid tire of 1910 was the British "pressed-on" band tire then in use in Europe and soon to be duplicated in America. These tires were fitted to the wheels by simply forcing or pressing on with a special press, but in the absence of conveniently located tire presses, some American manufacturers adapted the metal base idea to a "bolted-on" design (called "Demountable"), having bevels on the inside edges of the steel band so arranged that hoop-shaped "wedges" could be fitted to mount the tire, the whole assembly being bolted in place with "side flanges." Early metal base tires in America failed prematurely from fracture of the exposed hard rubber at the edge of the base band due to rough streets. To remedy this the band was made in "channel" form and the hard rubber protected by the side of the channel. In 1913 as an experiment, a "channel base" tire made to press directly on the S.A.E. (Society of Automotive Engineers) standard wheel without traction plate or staples, previously considered necessary, was tried. The experiment was successful, and this new type was so much simpler and less expensive that it rapidly superseded all other types in America. In 1915 wide single solid tires were introduced in America (8 in., 10 in., 12 in. and 14 in. wide) on the rear of heavy trucks in place of dual or twin tires. In 1920 wide singles and duals were almost equal in popularity.

The growth of pneumatic tire production in the United States is shown by the following figures, those for 1913, 1914, 1915, 1918 and 1919 being estimates:—

1913	6,588,000	1917	25,845,656
1914	8,983,000	1918	21,000,000
1915	12,840,000	1919	35,000,000
1916	18,564,957	1920	32,400,000

Structure, Materials and Manufacturing.—Solid tire structure is clearly shown in figs. 4 and 5. The tire maker's problem is to attach the tread rubber, which must be of highest quality, to the wheel. This necessitates a steel foundation band, a thin layer of hard rubber specially compounded to adhere to the steel, to which the tread rubber will also adhere. No practical way of making the tread rubber adhere to the steel is known. The component parts of the straight-side pneumatic tire are indicated in figs. 2 and 6. The bead portion has imbedded in it a circular inextensible wire core, usually of many strands in the form of braid, cables, or coils (to give a certain amount of flexibility). This wire anchors the tire to the rim, prevents it from blowing off, and gives rigidity enough so as to prevent the tire from creeping on the rim when inflated. The body or "carcass" of the pneumatic tire consists of bias "plies" of cotton fabric impregnated with adhesive rubber "friction," insulated from each other by a thin "skim coat" of the rubber, and having the edges of the plies folded or "tied in" alternately over and round the wire bead core. (*See* fig. 7 showing detail of a typical bead "tie-in.")

Since the function of the carcass is to serve as a strong yet flexible container for the inner tube with its charge of compressed air, the specifications covering the fabric call for great strength, uniformity of weight, freedom from grit, and particular grades of long staple cotton (Arizona, Sea Island, Egyptian, Sacalarides, Pealer, etc.). The two general classifications are: first, "square-woven" fabric, weighing $17\frac{1}{4}$ oz. per sq. yd., woven from warp and filling, twisted of 11 strands of No. 23^s yarn and having a tensile strength of 425 lb. per in. of width (both warp and filling) for the best fabric. The number of plies used are $3\frac{1}{2}$-in. 4-ply, 4-in. 5-ply, $4\frac{1}{2}$-in. 6-ply, 5-in. 7-ply. Second, "Cord" ply-fabric, which is primarily a warp composed of parallel cords of combed Arizona or Sea I. cotton resembling fish line and weighs 14 oz. per sq. yard. The parallel cords would get snarled up in the tire building processes, so for handling purposes it is necessary to weave a single light filling thread into the cord, $2\frac{1}{2}$ picks per inch. Each cord, $(((23^s)5)3)$ cabled yarn, has a tensile strength of 20 lb. In cord tires the cords of each ply must cross those adjacent, consequently the direction of the bias is reversed in the successive plies, which number as follows: $3\frac{1}{2}$-in. 4 plies, 4-in. 6 plies, $4\frac{1}{2}$-in. 6 or 8 plies, 5-in. 8 plies, 6-in. 8 or 10 plies, 7-in. 10 plies, 8-in. 12 plies, 9-in. 14 plies, and 10-in. 16 plies. As mentioned above, the tire plies are "tied in" round the wire bead core. To make a bead proof against rim cutting, etc., the most improved designs include narrow reinforcing strips of frictioned fabric (*see* figs. 1 and 7). The outermost of these is named the "chafing" strip. The outside of the carcass is entirely covered with rubber; the sides with a "sidewall" layer, $\frac{1}{16}$-in. thick, and at the tread portion with "cushion stock," "breaker fabric," "undertread," and "tread." The tread is the thick, tough, firm, wear-resisting face of the tire which is in contact with the road surface. The forces and stresses of vehicle operation are so severe in their tendency to tear the tread from the carcass that tire makers have found it impracticable to attach the tread directly to the carcass, and have had to resort to the interposition of the soft elastic adhesive "cushion" and open mesh "breaker fabric" to taper off the severity of the shearing stresses that would loosen the tread. Another very important function of the cushion and breaker is to prevent fabric rupture of the carcass by softening and spreading the intensity of impact of rough roads. The design and quality of the tread rubber must be worked out to wear at least as long as any other part of a balanced tire. The simplest smooth tread is a thin crescent in cross section; and in the case of non-skid designs they are generally crescent cross section with geometrical depressions or protuberances. The physical properties most desired are toughness, to resist cutting and chipping, and attrition resistance to provide against abrasion from road surface friction.

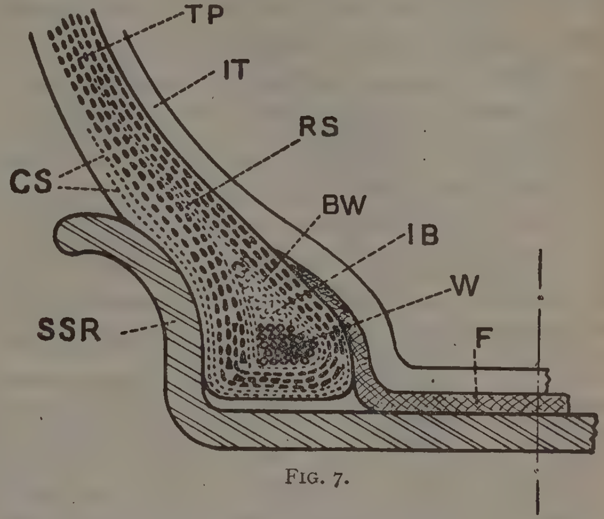

FIG. 7.

There are no particular differences of design for the inner tubes; nearly all makes resemble each other very closely. Highest quality rubber with little or no compounding except sulphur is used for grey tubes. The best red tubes are compounded with antimony sulphide. To be satisfactory the tube must hold air; not crack nor check in storage; not stretch out of shape; not stick to the casing; not split nor tear easily; not be affected by heating; and must be repaired easily. "Flaps," made of inexpensive rubberized fabric, are used in straight-side tires to prevent the tube from being pinched or nipped under the edge of the bead, and to keep water and rim rust away from the tube.

Only general ideas of manufacturing can be mentioned. First, there is "stock preparation"; the rubber and "compounds" are mixed, the fabrics "frictioned" and "skimcoated" with rubber, gauged to a very exact thickness, the frictioned fabrics cut to proper widths on a machine called the "bias cutter," the cushion, undertread, and sidewall stocks are sheeted out and cut to width on the calender, the tread rubber is prepared either on the calender or the "tubing" machine, and the bead wires are padded with rubber and frictioned fabric and cold pressed into shape. (*See* RUBBER for stock preparation.) "Building" the tire is the next step. A "core" in shape and size like the inside of a finished tire used as a building form, is mounted on a stand which permits the core to revolve. The tire plies are drawn taut around the core and rolled down smooth one after another, and at the proper time the bead is put in position. After the last ply is in place the tie-in at the bead is made; the building is finished by adding the sidewall, cushion, breaker strip and tread. During the decade 1910–20 tire building changed from all hand work to a combination of hand and machine building. In addition to saving labour, the machines turn out more perfect work. The final step is the vulcanizing or "curing." Fundamentally this is simply the processes of subjecting the "uncured" tire to a definite degree of heat for a definite length of time while the tire is confined under pressure in a strong iron "mould" (with an iron "curing core" or inflated "air bag" inside the tire). The heat effects chemical changes in the rubber compounds just as in cooking. Quality in a tire is very dependent on the curing. Not only must there be an optimum cure but the mould pressure must not disturb the fabric lest "buckles" or "mould pinches" be formed. This last is so important that many manufacturers resort to the more expensive double cure process—the carcass is semi-cured to "set" the rubbers and fabrics with much less danger of fabric displacement, after which the tread is cemented in place and the cure finished.

Tire Troubles.—For the purpose of general analysis in pneumatic tire service, five major tire troubles are recognized. They are: (1) unsatisfactory tread wear; (2) separation either (*a*) between plies of fabric or (*b*) of tread from carcass; (3) fabric ruptures; (4) bead troubles; and (5) tube troubles. In each case it is possible to classify pretty completely the origins of the mischief. Of course, many instances of premature tire failure are due to defects of design, materials or manufacture; on the other hand, by far the more frequent cause of tire trouble is abuse in the hands of the user as outlined below:—

Unsatisfactory Tread Wear	caused by	Abrasion Wheels out of alignment Too much power Improper use of brakes Skidding Abrasive road surfaces Under-inflation Sharp stones cutting tread Deterioration from oil
Separation (*a*) between plies of fabric (*b*) of tread from carcass	caused by	Excessive flexing Riding under-inflated Riding car tracks Overloading Riding flat Abuse of rough roads Cuts Heating from speeding Water-soaked fabric
Fabric Ruptures	caused by	Overload Over-inflation Under-inflation Stone bruises Premature ply separation Cuts Exposed fabric water-soaked Speeding on rough roads
Bead Troubles	caused by	Bent rims Under-inflation
Tube Troubles	caused by	Riding flat Leaky valves Puncture Heating from speeding Pinching under bead Tears from rough handling Neglect of spare tube

Solid tire troubles are confined to premature wear in the form of cutting, chipping, and breaking large chunks out of the tread; disintegration in the heart of the tire due to the accumulation of the heat of internal friction on long trips (rubber is such a poor conductor that heat is not adequately dissipated by windage); and separation of the whole mass of the tread rubber from the steel base-band. This last is a defect in materials or manufacture except in cases where external abuse fractures the hard rubber. In order to cushion a specific load properly a tire must not have too high air pressure; on the other hand, under-inflation results in excessive flexing which in turn brings on premature ply separation and fabric breaks. Experience has demonstrated that a pneumatic tire should not flex more than 11% (for large tires) to 15% (for small tires) of the section diameter of the tire. Recommendations designed to advise vehicle manufacturers and users as to the proper conditions under which the tires should be used are given in their "carrying capacity" schedules, as indicated in the following table.

Carrying Capacities and Inflation Pressures of Pneumatic Tires
S.A.E. Standard.

(J. E. HA.)

TIROL (*see* 26.1010), an Austrian Territory, divided by the Treaty of Peace of St. Germain into two separate parts—*Northern Tirol* and the district of *Lienz*. Northern Tirol is bounded on the E. by Salzburg, on the N. by Bavaria, on the W. by Vorarlberg and Switzerland and on the S. by Italy (German Southern Tirol). It lies mostly in the valley of the Inn, the northern part in the Kalk-Alpen and the southern in the schists and the central zone of the eastern Alps. The southern frontier almost coincides with the watershed between the Inn and the Adige. In the N., Tirol extends into the basins of the Lech and the Isar. The "*Föhnstrasse*" of the Brenner renders the cultivation of maize possible in some parts of the Inn valley. The new Territory has an area of about 4,787 sq. m. and its pop. was in 1910, 304,713, in 1920, 306,156 (64 per sq. mile). The area of the Lienz district is about 763 sq. m.; pop. in 1910 about 29,000.

The population is almost entirely German and Roman Catholic (1910, 98·9%). The proportion of males to females in 1910 was as 1,000 to 981 but in 1920, 1,000 to 1,053.

For administrative purposes Northern Tirol is divided into seven districts and the autonomous city of Innsbruck, the capital (pop. in 1920 55,659). Lienz is a district of itself. Other important places besides Innsbruck are Hölting bei Innsbruck (pop. 9,503), Schwaz (pop. 7,385), Hall (pop. 6,984), Kufstein (pop. 6,662), Lienz (pop. 5,756), Wörgl (pop. 4,030), Landeck (pop. 3,919).

Agriculture and Forestry.—In 1910, 23·7% of the present Tirol was unproductive. Of the productive areas (1910), 5·9% was arable, 0·2% gardens, 7·4% meadows, 41·5% pasturage (almost entirely high summer grazing lands) and 44·9% forest.

Cattle-raising and farming on the high lands are well-developed industries, although less care is bestowed on them than in Switzerland. But in 1918 there were only 159,398 head of cattle (of which 91,219 were cows) and 24,421 swine. The Tirolean breeds of cattle are highly esteemed. Forestry also holds an important place among the industries of this Territory.

Minerals.—The salt mines yielded 15,000 tons in 1915 (9% of the whole Austrian output) at Hall bei Innsbruck. The production of lignite, 40,000 tons in 1915 (scarcely 2% of the Austrian output), is chiefly from Häring in the Unter-Innthal. Copper, lead, zinc, antimony and sulphur and asphalt are also mined.

Manufactures.—Industry is still little developed although the use of the abundant water power is rapidly increasing; there are electrical stations at Innsbruck and elsewhere. Mention should be made of the wood, iron, textile, earthenware and glass industries. Innsbruck is as yet hardly an industrial city but has commercial importance and is visited by great numbers of tourists.

Communications.—Mountain railways from Innsbruck to the Stubai-Thal and to Mittenwald, the junction for Munich, have led to a great development of tourist traffic and are of marked importance for trade and industry.

TIRPITZ, ALFRED VON (1849–   ), German admiral and politician, was born at Küstrin March 19 1849. He entered the Prussian navy in 1865, and by 1890 had risen to be chief-of-staff of the Baltic station in the Imperial navy. In 1892 he was in charge of the work of the chief-of-staff in the higher command of the navy. He was promoted to be rear-admiral in 1895, and in 1896 and 1897 he was in command of the cruiser division in east Asiatic waters. In 1899 he reached the rank of vice-admiral and in 1903 that of admiral. For the long period of 19 years, from 1897 to 1916, he was Secretary of State for the Imperial navy, and in this capacity advocated the navy bills of 1898, 1900, 1907 and 1912 for increasing the German fleet and successfully carried them through the Reichstag. In 1911 he received the rank of grand-admiral, and he retired in 1916.

The best account of Adml. von Tirpitz's naval achievements and political activities is contained in the book which he published in 1919 under the title of *Erinnerungen*. In that book he shows how gigantic was the task of creating the new German navy with which Great Britain had to reckon at the outbreak of the World War. Not only had a whole array of subsidiary industries to be established and supplies of raw materials secured; thousands of skilled workmen and hundreds of directing personalities of strong character and exceptional ability had to be found and trained. It has been customary to attribute the creation of the German navy to the Kaiser William II., and it is true that in large part the initiative for successive increases, and the demagogic appeals by which they were supported, originated with the Emperor. On the other hand, it was Tirpitz who not only conducted the practical advocacy of these schemes in the Reichstag, but also organized the service of propaganda in the German press and on the platform, putting popular pressure on the parliamentary representatives of the nation and constraining them to agree to the enormous expenditure which these schemes entailed. William II. was often a hindrance as well as a help, and Tirpitz gives instances in which the work of the construction departments and even that of the Secretary of State were interrupted or hampered by wild-cat Imperial projects for the construction of architecturally impossible vessels or of mechanically impossible machinery. One of these projects, on which an elaborate report had actually to be submitted to the Emperor, was a device for which it was claimed that it had solved the problem of perpetual motion. In the conduct of the naval war the official rôle of Tirpitz was confined to reporting and advising at general headquarters, the actual conduct and initiative in operations being in the hands of the higher command of the navy at Wilhelmshaven, subject to the Emperor's approval or veto. Tirpitz advances two contentions; first, that he would have sent the navy into decisive action at an earlier stage of the war; secondly, that he would have made an earlier and more ruthless use of the German U-boats; but his opponents traverse both these claims, and in particular assert that as Secretary of State he had neglected the construction of submarines, so that Germany entered the war with a comparatively small supply of these vessels.

In the political sphere Tirpitz was a bitter opponent of Bethmann Hollweg, whom he charged with indecision, half-heartedness and nebulous conceptions of the necessities of German policy. His own experiences in the Reichstag, and the close contact with the political parties which his advocacy of successive naval bills had involved, made him a master of political intrigue. During the years which immediately preceded the war, as well as during the first 18 months of the conflict, he was himself a candidate for the office of Imperial Chancellor, in the sense that many of the reactionary Conservatives and of those who advocated a ruthless conception of policy in peace and war regarded him as their political hope. Lord Haldane, in his book *Before the War* (1920), records his impression of Tirpitz when he visited Berlin in Feb. 1912 in order to make tentative proposals for an agreement regarding the limitation of new construction. Bethmann Hollweg, Lord Haldane thought, was willing to entertain the British suggestions; it was Tirpitz who behind the scenes offered a most strenuous opposition to any restrictions. Tirpitz himself maintains that his naval aspirations were directed not towards a war with Great Britain, but to the creation of a state of naval equilibrium or of German superiority, which would have enabled Germany to insist upon the unreserved coöperation of British policy in her world aims. It was probably true that Germany's policy was directed rather towards being so strong at sea as to make England unwilling to fight her unless absolutely necessary, than towards actually challenging British naval supremacy. But this policy was, in any case, bound to make England peculiarly sensitive to provocation by Germany,—a point which was ignored by the champions of a great German navy. Tirpitz's book, in so far as his statements may be trusted, throws much light upon the circumstances in which German policy was directed or drifted in July 1914 into paths which inevitably led to war. He enlarges in particular upon what he considers the folly of the declaration of war upon Russia (*see* BETHMANN HOLLWEG). He is naturally influenced to some extent in what he says by his poor opinion of Bethmann Hollweg's capacities and by his own thorough knowledge of the Emperor's fickle and impetuous character.

His resignation in 1916, and the stages of his relations with the Emperor and the Higher Naval Command which led to it, are described in his *Erinnerungen* with almost tragic vividness. Tirpitz remained a leading figure in the political agitation against the Chancellor's policy and was selected as president of the "Vaterlandspartei," a political association started in Sept. 1917 under reactionary auspices to combat all attempts at peace by compromise, and to advocate the prosecution of the U-boat warfare with extreme ruthlessness. This association offered a vigorous opposition to the movement, which succeeded only when it was too late, for obtaining alterations in the constitution limiting the power of the Emperor and laying the foundations of real parliamentary government in the Empire and in Prussia.

After the revolution Tirpitz was one of those against whom German popular animosity was chiefly directed as being the inspirer of the naval and world policy which led to the war, and also the most powerful influence in prolonging it. He was one of those who found it inadvisable to remain in Germany, and he departed to find a refuge in Switzerland. After the republican Government seemed fairly established, and the reign of law and order was being restored, he returned; but, possibly on account of his advanced age, did not appear during 1921 to be taking any further part in political intrigue or agitation. (G. S.)

TISZA, STEPHEN, COUNT (1861–1918), Hungarian statesman (*see* 26.1017). During the Coalition Ministry (1906) Tisza retired into private life on his estate of Geszt. It was only in the House of Magnates that he expressed his views against the extension of the franchise. When Count Khuen-Hedervary took office in 1910, Tisza was his most earnest and effective opponent in the country. His return to the political arena took place during a period of obstruction. In 1912 he became president of the House of Deputies, and on July 10 1913 again returned to power as prime minister. When the World War broke out a truce was arranged between Tisza and the Opposition, but it did not last long, and in 1917 he was compelled to resign. Though hitherto he had been the most zealous adherent of Dualism and the partnership with Austria, he declared for the scheme of personal union after the manifesto of King Charles on Oct. 17 1918, the Pragmatic Sanction to hold good on the question of national defence, but with a separate Hungarian army and separate diplomatic representation abroad. When he saw no prospect of winning the war he pleaded for a peace in common with Germany on the basis of President Wilson's Fourteen Points. On Oct. 31 he was assassinated in his villa by men in military uniform, said to have been worn as a disguise.

Tisza had a power over Austria and Hungary such as had hardly ever been exercised before by an adviser of the Crown. He was distinguished by his determination and inflexible convictions, and was opposed to any policy involving weak concessions. In the newspapers *Magyar Figyelö* (Hungarian Observer) and *Ignazmondó* (Truth), he published articles on many subjects; in addition he published the historical study *Von Sadowa bis Sedan* (in Hungarian and German).

See the biography by Karl Szaz (Hungarian); and David Angyal, *In Memory of Stephen Tisza* (Hungarian). (E. v. W.)

"TITANIC" DISASTER, 1912.—No single event in 1912 could compare, in the intensity of its universal appeal to human emotion, with the awful disaster to the British steamship "Titanic." At 2:20 A.M. on April 15, that great White Star liner, the largest afloat, on her maiden voyage, went to the bottom of the Atlantic in lat. 41° 46′ N., long. 50° 14′ W., about 2¾ h. after striking at full speed on an iceberg, with a loss of 1,513 souls out of 2,224 on board.[1] It had been supposed that such a vessel was unsinkable, and the tragedy raised numerous questions as to methods of ship construction, and additional provision of life-saving equipment. The "Titanic" had nominally boat accommodation for double the number saved, and the 20 boats launched were meant to hold 1,178 persons instead of the 652 they actually contained when they left the ship; moreover, the disaster occurred under exceptional conditions for getting people safely off, in the way of smooth water and fine weather. The most salutary lessons seemed to lie in the following directions: first, improved design and construction so as to provide a really unsinkable ship; secondly, greater precautions in navigation and look-out—for the "Titanic" was going at 18 knots (according to Lord Mersey an "excessive speed"), though it was known that icebergs were exceptionally numerous on the course; thirdly, better and more regular organization on shipboard—by boat drill (there had been none on the "Titanic") and otherwise, for the emergency of having to abandon ship; and fourthly, a compulsory service of wireless on all liners, working day and night—for it was one of the most lamentable incidents in the whole terrible story that the "Titanic's" wireless call for help, picked up all over the ocean and nobly responded to by the "Carpathia" (Capt. Rostron), 70 m. off, fell on deaf ears on the "Californian" only 8 or 10 m. away.[2] The full record of the disaster is contained in the reports of the inquiries held at once in America by a committee of Congress under Senator Smith, and later in London by a special commission presided over by Lord Mersey (report issued July 30). Painful and difficult though it was to distribute blame in such a case, there could be little doubt that the loss of life—817 passengers out of 1,316, and 696 out of a crew of 908—was much greater than ought to have been possible. Capt. E. J. Smith (b. 1853), a highly experienced seaman, who had been for 38 years in the service of the White Star Co. and who now went down with his ship, seems to have been averse from taking steps at first which might cause a panic on board; otherwise there should have been time, if adequate means of organization and of commanding discipline had existed, not only to get more people into the boats but to improvise rafts. In naval circles the opinion was strongly held that this should have been done, since the injuries received by the ship made it certain that she would sink in a given time. If so, there was a weakness in the higher command, or the means provided for exercising it in the organization of the crew on the "Titanic," for which no merely material equipment could compensate. A natural expectation of security had been engendered, alike among the owners, officers and passengers of these magnificently appointed liners, which, until a crisis actually came, had made it almost unthinkable that it could come in that way; but the fact remains that responsibility for the lives of passengers rests with those who control the ship. In this case, it was not the inadequacy of the physical means of escape that accounted for the large proportion of the lost who remained on board; it was the inadequate organization for purposes of using them, and inadequate information as to the necessity. Apart from that, both Great Britain and America could mingle sorrow and pride over many fine incidents of the tragedy, with its long death roll of prominent people from both sides of the Atlantic. When it came to the sending away of the boats, the order was "women and children first." The figures of the 711 saved by the "Carpathia" (including about 60 who were picked up in the boats after the ship went down) speak for themselves:—Women: first class, 140 out of 144; second class, 80 out of 93; third class, 76 out of 165; crew, 20 out of 23. Children: first class, 6 out of 6; second class, 24 out of 24; third class, 27 out of 79. Men: first class, 57 out of 175; second class, 14 out of 168; third class, 75 out of 462; crew 192 out of 885. Altogether the percentage of women saved was 74·35, of children 52·29, of men 20·27. The comparatively small proportion of third-class passengers saved was shown to be purely accidental and not due to any preference being deliberately given to others; they were handicapped, however, by their quarters being remote from the boat deck, and by so many of them being unable to speak or understand English.

TITTONI, TOMMASO (1855–), Italian statesman, was born in Rome 1855. His father, Vincenzo, a tenant farmer on a large scale at La Manziana, had taken part in the defence of the Roman Republic under Garibaldi in 1849, was exiled by Pius IX., and reëntered Rome in 1870 through the breach of Porta Pia. Tommaso Tittoni was educated first at Naples, and subsequently at Oxford and Liége. He began his parliamentary career as deputy for Civitavecchia in 1886, sitting on the Right, but he resigned his seat in 1897, having been appointed prefect of Perugia; three years later he went to Naples in a similar capacity, and in 1902 he was raised to the Senate. When Giolitti became premier for the second time in 1903, Tittoni became his Foreign Minister. He aimed at improving relations with Austria, and also tried to bring about a reconciliation with France; it was in fact under his auspices that President Loubet visited Rome. On the resignation of Giolitti in March 1905 Tittoni became interim premier for a few days and remained in the Fortis Cabinet as Foreign Minister. His proposal to reduce the duty on Spanish wines in connexion with an Italo-Spanish commercial treaty aroused a storm of indignation among the agricultural classes and caused the fall of the Cabinet on Dec. 24 1905; and although Fortis composed a new administration, Tittoni did not enter it. A few months later he was appointed ambassador in London (March 1906), but in May, on the fall of the Sonnino Cabinet and the return of Giolitti to power, he was again summoned to the *Consulta*. He continued the policy of improving relations with Austria, which did not contribute to his popularity; after the annexation of Bosnia and the Herzegovina his imprudently worded speech at Carate created the illusion that Italy was to be compensated, perhaps by the cession of the Trentino, and the disappointment when nothing of the kind materialized greatly weakened his prestige. He remained in office until the fall of Giolitti in Dec. 1909. In April of the following year he was appointed ambassador in Paris. When the World War broke out, in spite of his Triplicist policy he openly expressed himself in favour of Italian neutrality, and on Italy's entry into the war he was careful not to compromise himself with Giolitti's attitude. But he was not at his ease in the French capital and in Nov. 1916 he resigned from the Paris embassy. On the fall of the Orlando Cabinet in June 1919, the new Premier Nitti chose Tittoni as Foreign Minister and first delegate at the Peace Conference, but the severe strain of the work told on his health and he was forced to resign in November. He was chosen president of the Senate in Dec., and soon after was appointed Italian delegate on the Council and Assembly of the League of Nations, but ill-health again forced him to relinquish both appointments. In 1910 he had published a volume of speeches, which was translated into English, and in 1919 he brought out a work on political conflicts and constitutional reform.

TOBACCO (*see* 26.1035).—In 1913 the quantity of tobacco retained for home consumption in the United Kingdom was: unmanufactured 94,079,343 lb., and manufactured 1,896,668 lb. The year 1914 showed the beginning of the abnormal business in the factories. In that year, apart from tobacco sent to H.M. forces through the bonded factories, the quantity retained for home consumption was: unmanufactured 99,415,786 lb., and manufactured 1,585,411 pounds. In 1915 the amount of unmanufactured tobacco retained for home consumption rose to 106,516,337 lb.; the following year it was 101,719,199 lb.; and then from 1917, when the total was 104,501,452 lb., the amount went to 106,566,549 lb. in 1918 and to no less than 142,826,314 lb. in 1919. With imported manufactured tobacco, including cigars, cigarettes and snuff, the total consumed in 1919 was 145,344,604 lb. In 1914 the amount of unmanufactured tobacco which went through the factories and was consumed represented a consumption per head of population of 2·16 lb.; in 1919 it was 3·09 lb. per head.

---

[1] The exact figures remained doubtful, but those given are from Lord Mersey's report.

[2] Apart from the "Californian's" wireless operator having gone to bed, however, Lord Mersey was satisfied that if her captain had realized the situation properly she could have saved "many, if not all, of the lives that were lost"; for evidence showed that distress rockets sent up on the "Titanic" were actually seen from the "Californian," though no action was taken in response to them. The incredibility of such a disaster appears, in that case, to have paralysed the capacity for interference.

The imports of tobacco into the United Kingdom by no means follow in the same ratio as the figures of consumption. When the World War broke out, thanks to the tradition of the trade and the prudent foresight of manufacturers, there were large stocks in the country. In view of the heavy requirements, fresh importations of raw tobacco were secured as before, but when the submarine activity added to the already urgent call upon shipping, imports dropped off very considerably and tonnage was only allowed sparingly for tobacco freights. The import of unmanufactured tobacco in 1913 was 162,365,925 lb.; in 1914 it was 158,692,857 lb.; 1915 202,650,863 lb.; 1916 164,265,861 lb.; 1917 46,543,060 lb.; 1918 171,639,313 lb. and in 1919 348,906,624 lb. It will be seen that the curve of imports drops in 1916 and is much lower still in 1917, and that so soon as shipping became available the depleted stocks of manufacturers were promptly renewed. Manufacturers had been purchasing but shipment had been held up. In addition to the manufactured tobacco imported in 1919, the following manufactured products were also brought into the country in that year: cigars, 1,670,735 lb.; cigarettes, 4,460,535 lb.; other tobacco, including snuff, 1,755,447 lb.

Before examining the Control Board's activities and retail prices in England it is interesting to note how the Treasury got on in the matter of revenue and under the influence of taxation which was several times heavily increased. The net receipts of British Government revenue in each year ended March 31 were as follows: 1913–4 £18,263,479; 1914–5 £19,272,007; 1915–6 £25,743,149; 1916–7 £27,342,339; 1917–8 £33,285,107; 1918–9 £46,231,430; 1919–20 £60,857,917. This crescendo of revenue gains was the result of two principles working together: the war impetus given to the use of tobacco, including the fact that ladies were in many cases smoking as well as men, and secondly the increased tax. The rate of unstripped tobacco leaf containing 10% or more of moisture, which was 3s. 8d. per lb. in 1914, was raised to 5s. 6d. per lb. from Sept. 22 1915, and this rate lasted till May 1917, other duties such as that on manufactured tobacco being correspondingly increased. On May 3 1917 the duty was increased from 5s. 6d. per lb. to 7s. 4d. but out of deference to the working-classes this increase of 1s. 10d. was reduced on July 15 to an increase of 11d. only, which brought the tax down to 6s. 5d. per lb., at which it remained from July 16 1917 to April 22 1918. The yield kept on the up-grade, notwithstanding the duty, and on April 23 1918 the duty was raised to 8s. 2d. per lb. at which it remained, the 1921 budget having left the main tax unaffected.

There were, however, some specialties in English taxation of distinct note apart from the ordinary tobacco duties. These special features consisted in the application of preferential treatment to empire-grown tobacco and in a surtax on imported cigars. On and after Sept. 1919 the ordinary duties were reduced by one-sixth in the case of tobacco consigned from, and grown, produced or manufactured in, the British Empire. On and after April 1920 an additional duty of 50% *ad valorem* was imposed on imported cigars, reduced by one-third in the case of cigars entitled to preferential rate of duty. This surtax was abolished as from May 10 1921.

War Supplies.—In examining the actual consumption of tobacco one has not merely to consider the imports and revenue figures. There was the large quantity of duty-free cigarettes, cigars and tobacco supplied to H.M. forces, whether in the form of rations or sent out duty free from manufacturers' premises, on orders obtained through tobacconists and from other sources. The dimensions of this most essential portion of the tobacco consumption can be gauged by several indications beyond the broad fact that every soldier or sailor who desired to smoke was well supplied. For instance the British Government chemist in his report for 1916 announced that the samples of tobacco exported on drawback numbered 32,004 or appreciably more than double the highest number examined in any previous year since the introduction of the drawback regulations in 1863. The number of laboratory certificates issued in connexion with samples was 81,889, an increase of no less than 48,179 over the corresponding number for the previous year. This was due to the dispatch of tobacco for the Expeditionary Force. The most direct indication however is afforded by the customs and excise report. This document for 1917–8 records the fact that, apart from ships' stores, the following were in that year the weights of cigarettes, etc., sent to the British Expeditionary forces and on which drawback was granted: tobacco, 123,256 lb.; cigarettes, 7,080,449 lb.; cut, roll, cake or other manufactured tobacco, 5,877,968 lb.; snuff, 525 lb. These figures include the large quantities of cigarettes supplied through tobacconists sending customers' orders to the manufacturers for sending out duty-free tobacco, and also orders sent from firms and other organizations who specialized in soldiers' parcels. They do not include the considerable number of parcels of cigarettes bought from a tobacconist's duty-paid stock and forwarded in a composite parcel by the soldier's friends. At a Navy and Army Canteen surplus stock sale in Aug. 1920 over 80 million cigarettes and 100 tons of tobacco were disposed of, 60 million of the cigarettes and the tobacco being sold for export only. The cigars for disposal were for the most part replaced into trade channels.

The British Tobacco Control.—The control of food in the United Kingdom, for war purposes, was followed by that of tobacco. The form of control was defined in two orders issued under the Defence of the Realm Regulations. One was called the Tobacco Restriction Order (No. 1) 1917, dated May 24 1917, and made by the Board of Trade under Regulations 2F and 2JJ, and the other the Tobacco Restriction Order (No. 2) 1917, dated July 11 1917. These two orders between them put the grip of the Board of Trade firmly upon every shred of tobacco which entered the country or was in stock, and controlled its movements, sale and price. The powers given were so full that an immoderate use of them could have paralysed the industry. The fact was that the control was a complete success, alike from the military or munition point of view, from the public point of view, and, greatest feat of all, from the trade point of view. The control lasted from its inception by the Restriction Orders named down to Jan. 11 1919 when the Board of Trade revoked the Orders, stating that "the effect of this revocation is that from the date named all powers exercised by the tobacco control board in regard to the control, importation and distribution and prices of tobacco will be abolished." During the period of control the board had systematized powers in regard to production, manufacture, treatment, use, consumption, transport, storage, distribution, supply, sale or purchase of or dealing in tobacco; they had power to place stocks at the disposal of the Board of Trade; any person delivering tobacco had to keep a record of the quantities delivered; tobacco sold by manufacturers, importers and wholesale dealers was ordered to be as nearly as possible of the same description and was to be sold in similar quantities and under like conditions and to the same customers as in the year 1916. In view of the shortage of shipping and the consequent necessity of economizing the available supplies of tobacco in Britain, an order was made bringing under control the stocks of manufactured and unmanufactured tobacco (of the latter a census was taken) and prohibiting the owners of stocks from dealing with them otherwise than as authorized by the Board of Trade. The order also provided for the regulation of the prices at which tobacco might be sold as from June 1 1917. No restrictions were imposed on the supply of tobacco to H.M. forces overseas. The Control Board at first consisted of the following: Mr. Lancelot Hugh Smith (chairman), Major F. Towle (quartermaster-general's department), and Mr. Gerald Bevan. They were assisted by an advisory committee, representative of all sections of the tobacco trade. The work of the Control Board was arduous; they were called upon to make numerous decisions and the way in which they exercised their powers helped the trade to keep going, guaranteed fair prices to the public and gave general satisfaction. A retail price schedule was issued, and one of these had to be exhibited prominently by every dealer in tobacco. Non-compliance rendered the tobacconist liable to a fine.

The Control Board's issue of Restriction Orders was to conserve supplies, but as time went on, owing to the large requirements of H.M. forces and the continued heavy demand at home, it became evident that the supply to the army might be jeopardized and a rationing system rendered necessary unless additional importations were allowed. The diminution of stocks in the bonded warehouses rendered some step advisable. The Control Board, therefore, though originally formed to restrict, now appeared in a new rôle, that of encouraging supplies, and in Jan. 1918 it was reported that the board were asking that tobacco should, with food and ammunition, be given priority of importation. From March 12 1917 there had been a restriction of clearances. The daily amount of tobacco allowed to be delivered out of warehouse or ship's side was restricted to the daily average quantity for the year ended Dec. 31 1916. But now that more tobacco was needed the question of further imports became urgent. Eventually an arrangement was made by which the British-American Tobacco Co., who had chartered the steamers of the Garland line, should bring in a supply for what became known in control circles and in the trade as "necessitous manufacturers." The result was that all were able to carry on.

Germany and France.—The difficulties of war-time conditions were thus successfully grappled with by the British Control Board. France, under its State *Régie*, did not do so well. It was reported in Dec. 1917 that under the stress of prolonged war the tobacco *régie* had practically broken down. It became well-nigh impossible to buy either tobacco or cigarettes in France. It was stated that owing to the intensification of consumption, due in part to women smoking, the monopoly administration had been taken unawares. Whatever the explanation, the State control did not produce the good results which control of an industry founded on private enterprise brought about in Great Britain. Still France was not so badly off as Germany and Austria. In Oct. 1917 permission was given by the German Government for the manufacture of tobacco-like substances without the employment of tobacco. These substitutes were allowed to be introduced into the trade and were made subject to the tobacco tax.

A schedule of permissible substances was drawn up. What the substances were was made evident to the trade in England by the photographic reproduction in the English trade paper *Tobacco* of advertisements from the *Süddeutsche Tabakzeitung.* One of these advertisements read: "Beech, Chestnut, Lime, Maple, Plane, and Vine leaves in withered and quite dry condition, sound and cleanly sorted in sacks for instant delivery, against banker's security will be purchased. Samples asked for." Another advertiser offered for sale "Cherry leaves, tobacco brown, can be promptly delivered." Meanwhile the proportion of German-grown tobacco in cigars had increased until they were hardly fit to smoke. Large consignments of tobacco acquired by the manufacturers of Bremen, Hamburg, and Dresden from the Balkans were destined for the army, the civil population having to rely upon the substitutes. A similar shortage was experienced in Austria. In both countries drastic control regulations were enforced.

United States.—In accordance with an Act of Congress, approved April 30 1912, the Bureau of the Census collects and publishes (quarterly since 1916) statistics of leaf tobacco held throughout the country. The statistics deal with all manufacturers who during the preceding calendar year produced more than 50,000 lb. of tobacco, 250,000 cigars, or 1,000,000 cigarettes; and dealers who had on an average more than 50,000 lb. of leaf tobacco in stock; included also is the imported leaf tobacco held in bonded warehouses and bonded manufacturing warehouses. No account is taken of smaller establishments or of amounts held by growers.

On Oct. 1 1912 (first official report) there were on hand 1,047,404,560 lb.; on April 1 1921 1,818,781,268 pounds. In every case the April report was the largest, as by that time the gathered crop has been sold. The largest production is "Bright yellow," from Georgia, North Carolina, South Carolina, and Virginia (571,148,382 lb. held April 1 1921); "Burley," from Indiana, Kentucky and Ohio (399,001,690 lb.); and "Dark fired," from Kentucky and Tennessee (178,847,170). Of "Cigar" types the "Pennsylvania" usually ranks first (93,918,626 lb. held April 1 1921); other important types are "New England," "Ohio," and "Wisconsin." A census of the tobacco crop was taken every 10 years after 1839 and of acreage after 1879. The peak of production was reached in 1920 with 1,508,064,000 lb., estimated; the largest producing states were Kentucky (467,500,000 lb., 550,000 ac.), North Carolina (384,120,000 lb., 582,000 ac.), and Virginia (177,390,000 lb., 240,000 ac.). Since 1869 Kentucky has been the leading state. For 1920 the estimated average yield per acre for the United States was 796 lb., as against 894 in 1911, the record year; the variation of production among the states is remarkable, ranging from 600 lb. per ac. in Georgia to 1,510 in Pennsylvania. Of the two recognized classes of tobacco—"Cigar" and "Chewing, Smoking, Snuff and Export"—the former constitutes only one-sixth of the production.

The peak of average prices was reached in 1919. That year the farmers sold 1,440,979,349 lb., ranging from 17 cents in Pennsylvania to 65 cents in Louisiana. The averages for these states in 1911 were 9½ and 31 cents respectively; in 1920 20 and 40 cents. In the latter year Alabama led with 55 cents.

Although the United States surpasses all other countries in tobacco production, there are large imports of leaf for cigars and cigarettes. In 1920 imports were 82,231,396 lb., of which 18,856,091 lb. came from Asiatic Turkey, chiefly for cigarettes. Cuba furnished 23,616,999 lb., Porto Rico 14,728,645 lb., and the Philippine Is. 1,842,613; the Netherlands 7,720,255 lb. and the Dutch East Indies 2,102,664 pounds. Imported cigars and cheroots come chiefly from the Philippines (over 5,000,000 in 1920). Over five-sixths of tobacco imports enter through the district of New York.

Exports of domestic tobacco and tobacco products from the United States amounted in 1920 to $288,693,799 as against $306,861,519 in 1919. Of cigarettes there were exported 15,833,870,000, valued at $35,977,374; of these over 8,500,000,000 went to China, over 2,000,000,000 to Italy, and over 1,000,000,000 each to British India and the Straits Settlements. Most of the tobacco exports pass through the district of New York.

On Jan. 1 1920 there were in the United States 13,591 tobacco factories, of which 11,483 produced cigars, 1,871 tobacco and snuff, and 237 cigarettes; of bonded manufacturing warehouses there were 13 producing cigars, 2 cigarettes and tobacco, and one tobacco. New York has the greatest number of establishments. The tax on tobacco is an important source of Government revenue. The amount collected rose from $3,097,620 in 1863 to $88,063,948 in 1916. Revenue in 1917 was $103,201,592; in 1918 $155,757,278; in 1919 $204,982,560; in 1920 $294,267,609.

The war period in America has been reviewed in a report of the U.S. War Industries Board. Herein it is stated that men in service used on an average from 60% to 70% more tobacco than they did in civil life. The civil population, due probably to increased prosperity, the cutting down of alcoholic beverages and the sentiment developed by the various campaigns for supplying "smokes" to soldiers, used 15 to 20% more tobacco. No important control beyond some conservation in methods of packing was found necessary, though a price-fixing plan was under consideration when the war was closed. The demand from Europe, it was pointed out, as well as from the U.S. manufacturers, continued to increase, and when producers saw in the autumn of 1917 that they could successfully increase the price of their manufactured articles, even in face of the increased revenue taxes, very high prices for leaf were assured. It was not until the middle of 1917 that the price of finished products began to rise. The advance was steady and rapid, reaching, 200% of normal on many products by Sept. 1918. The tax on tobacco was increased in Oct. 1917 and Feb. 1919, but these increases formed a relatively small part of the increase in prices.

Leaf Prices.—The unprecedented consumption of tobacco products both in America and Europe reacted on the growers, who planted large crops which they sold under favourable conditions. Prices of the raw material steadily mounted owing to the competition. A really accurate estimate of the effects of war conditions on the price of raw tobacco would detail the various grades and growths and show the alteration as it affected each. The bright cigarette tobaccos of Virginia and the Carolinas were among those which commanded very greatly increased prices, but perhaps the best way of dealing with the question is to take the average prices from 1913 to 1919. The statistical abstract for the United Kingdom gives these average prices in pence per lb. for unmanufactured tobacco as follows: 1913 9·92; 1914 9·75; 1915 8·92; 1916 9·44; 1917 15·47; 1918 21·93; 1919 26·29. Thus it is seen that manufacturers were paying more and more for leaf tobacco, but prices later became more moderate. The cost of eastern leaf from Macedonia and other oriental countries was somewhat high in 1921, but was likely to get lower with increased production.

Waves of Fashion.—Long before 1914 the cigarette had already grown so in public favour that it was rapidly supplanting the pipe and cigar. The war intensified the process. Up to 1914 the most esteemed cigarettes were of the finest Turkish or of bright Virginia tobacco. If anything, the Turkish cigarette was the more used by the fastidious smoker. War conditions caused the cigarette of Turkish or Macedonian tobacco gradually to diminish and the British forces did their arduous work for the most part (and especially after the stocks of the better class Turkish cigarettes had become scarce) on cigarettes of American tobacco. Cigars were of course in request in officers' messes and among certain people at home. Pipes were used by comparatively few. After the Armistice both the cigarette and the cigar, but mostly the latter, seemed to be yielding ground to the pipe. Great Britain has for many years been the home of smoking mixtures in which various kinds of tobacco are blended to make a satisfactory pipe mixture. These mixtures are much appreciated too in America, to which country there is a fair export trade. The British-made briar pipe also sells well in the United States. An influence towards making pipe smoking once more the fashion was the imposition in 1920 by the British chancellor of the exchequer of the *ad valorem* surtax of 50% on imported cigars. This made imported cigars too dear and gave the impression to the public that all cigars were dear. When Mr. Austen Chamberlain subsequently stated, on April 25 1921, in the House of Commons, that "the surtax has lowered the revenue instead of raising it and has entirely failed to justify itself. Let others learn by the mistake I committed," he might have added that the surtax had temporarily killed the cigar trade.

British Empire Tobacco.—A new prospect was opened in the economic history of tobacco by the institution of the principle of preferential fiscal treatment of tobacco grown, produced, or manufactured in the British Empire. A reduction in the tax of one-sixth is acting as a stimulus to the young tobacco-growing industry of British Africa from Cape Colony to Rhodesia, of Canada and of some other portions of the empire. Growers in the United Kingdom and Ireland have also been encouraged by an allowance. This preferential taxation will probably be found of greater significance to the tobacco manufacturing industry and to the smoker than is even the attainment of the laudable object of helping the tobacco farmers of the empire. A quasi-monopoly such as that possessed by the United States and the Balkans does not economically suit the direct buyer (the manufacturer) or the eventual buyer, the smoker. A widening and multiplication of the sources of supply must have a steadying effect on prices. The lesson of the war was that, quite justifiably under the new conditions, very heavy prices had to be paid for all tobacco, whether from America, Nyasaland or elsewhere. For many years the Imperial Tobacco Co. have been large buyers of African tobacco. Their headquarters in Africa are at Blantyre, where they have encouraged the grower. Tobacco grown in Ireland and also in England has been put on the market with some success. In the British system of taxation a rebate of one-third of the excise duty was allowed on tobacco grown in Ireland for experimental purposes prior to 1909, and on tobacco grown in Great Britain up to 1913 inclusive. From those dates arrangements have been made under which certain grants sanctioned by the Treasury are applied in encouragement of the industry. In 1918 the following quantities were grown: England and Wales, 31,844 lb.; Ireland, 77,978 lb.; total, 109,822 lb.; net receipt of duty, £34,482. In 1919: England and Wales, 78,825 lb.; Ireland, 77,837 lb.; total, 156,662 lb.; net receipt of duty, £60,785. (E. S. C.)

TOGOLAND (*see* 26.1046).—This German protectorate in W. Africa was conquered by Anglo-French forces in 1914, and German sovereignty was renounced by the Peace Treaty.

For some years preceding 1914 efforts had been made to reconcile the natives to German rule. This process began in the schools, where the children were taught to sing the German national anthem and to wave German flags; the teaching of English formerly common in the mission schools was abandoned. But the emigration of natives to the Gold Coast, which had resulted from the harsh methods of Herr W. Horn (governor 1902–5) and other officials was still marked in 1913, while on the east there was a similar attraction to Dahomey. Herr Horn had been dismissed for misconduct; his successor, Count J. von Zech, was more conciliatory to the natives and gave much attention to the development of railways and trade. In 1912 Germany made a departure in its colonial appointments by sending out as governor a member of one of the reigning families, Duke Adolf Friedrich of Mecklenburg, who was known as leader of an expedition which had crossed Africa. The duke was on leave when the World War broke out. He had, however, seen the linking up of Togoland to Germany by submarine cable (Jan. 1913), the extension of agriculture and an expansion of exports.

Maj. von Döring, the acting governor, had the advantage in the critical days of July 1914 of direct communication with Berlin by a wireless station at Kamina, which had just been erected. He made preparations to invade Dahomey, on the assumption that Great Britain would not enter the war. When this supposition was proved to be wrong Maj. von Döring received instructions from Berlin to propose that Togoland and the adjacent French and British colonies should remain neutral. The offer was made to the local authorities concerned but was rejected, in the case of the British by order of the Colonial secretary in London. The chief concern of Berlin in regard to Togoland was to preserve the use of the Kamina wireless station, through which they could communicate with all the other German colonies in Africa, and when the neutrality offer failed, orders were issued for the defence of Kamina. Von Döring made no attempt to defend the coast region: Senegalese Tirailleurs from Dahomey under Capt. A. Castaing occupied Little Popo (Anecho) on Aug. 6 and Togo on Aug. 8. Meanwhile an officer, Capt. E. B. Barker, had been sent under a flag of truce by the acting governor of the Gold Coast to Lome on Aug. 6 to demand the surrender of Togoland to the British. Twenty-four hours' delay was given; on Capt. Barker's return on the 7th he found that the German troops and Maj. von Döring had retired and that the official left behind had instructions to surrender the colony as far as a line drawn 120 km. N. of Lome. The next day co-operation between the French and British forces was arranged and the chief command given to Capt. F. C. Bryant, senior officer on the spot on the Gold Coast.[1]

Capt. (tempt. Lt.-Col.) Bryant reached Lome, by sea, with two companies of the Gold Coast Regt., on Aug. 12—a total strength of 57 Europeans and 535 natives with 2,000 carriers. He marched N. along the railway towards Kamina, being joined by Capt. Castaing's French contingent (three Europeans and 155 natives) on Aug. 18. The enemy had blown up the railway bridge over the Chra river and strongly entrenched a position in dense bush N. of the stream. This position was attacked on Aug. 22, but was not carried. The German force consisted of 60 Europeans and 400 native soldiers, and they had three machine-guns which were used to good purpose. The German losses were slight, the Allies' casualties were 73 (including 23 killed) or 17% of the force engaged. During the night the Germans evacuated their position and fell back on Kamina. Maj. von Döring had probably learned that a separate French column from Dahomey was within two days' march of Kamina and that a second British column was also approaching that place from the west. While Col. Bryant was preparing to attack Kamina, the Germans, on the night of Aug. 24–5, blew up the wireless station and on Aug. 26 after vain efforts to obtain terms, von Döring surrendered unconditionally. There were found to be 206 Europeans in Kamina. In the previous fighting five Germans had been killed and 32 taken prisoner. Thus southern Togoland was in the hands of the Allies; in the northern part Yendi surrendered to a British force of one officer and eight men on Aug. 18, while a French column of 630 rifles under Capt. Bouchez, coming from Upper Senegal, covered 310 m. in 20 days in the height of the rainy season and occupied Sansanne Mango and the rest of Togoland with little opposition. Many of the German native troops deserted to the French. Some 200,000 rounds of soft-nosed bullets issued by the German authorities were captured. The conquest of Togoland—a region the size of Ireland—was notable not only for its rapidity and neatness of execution, but for the fact that the operations were conducted entirely by the local authorities and by the troops on the spot when the war began—in this respect the little campaign was unique. After the conquest the country was divided for administrative purposes into British and French zones, the British occupying the western part, including Lome. The natives settled down rapidly under their new masters.

By decision of the Supreme Council May 7 1919, the mandate to administer Togoland was given to Great Britain and France. An agreement of July 10 1919 divided the country into areas to be administered by Britain and France respectively. This agreement, which left the port and district of Lome to Britain, caused some dissatisfaction in French colonial circles and was amended by a convention of Sept. 30 1920 when in exchange for an enlarged area in the interior Lome and the whole of the seaboard—but 32 m.—went to France. The formal transfer of Lome to France followed in Oct. 1920. In the N. the area acquired by Britain included Yendi and adjoining districts, thus bringing the whole of the Dagomba country under British control. Of the total area of the German colony 13,500 sq. m. came under the British mandate and 20,200 sq. m. under the French mandate. Of the pop., estimated (1920) at 1,250,000, some 850,000 lived in the French area. Europeans, mostly British and French officials and traders, numbered about 500. There was also an energetic colony of Syrian traders.

The railways fell within the French area. They consisted (1921) of a line from Lome N.E. to Atakpame, completed in 1911 and 102 m. long; from Lome along the coast to Anecho (27 m.) and from Lome N.W. to Palime (74 m.). They are all of metre gauge. The principal articles of commerce are products of the oil and coconut palms, cotton, maize, cocoa, live stock, rubber, sisal and other fibres. Of these the most important are palm oil and kernels. There is a considerable transit trade between the Gold Coast and Lome and between Anecho and Dahomey. In 1910 exports were valued at £360,000, and imports at £570,000. In 1913, the last full year of German rule, exports were valued at £455,000 and imports at £530,000. Cotton yarns, textiles, hardware and building material were the chief imports. In 1913 Germany took 60% of the exports and supplied 42% of the imports. After the Allied occupation trade for several years was mainly with neighbouring countries and the United Kingdom. In 1918 the value of exports from Lome reached £434,000, and the value of imports £385,000. In 1919 the figures were: exports £880,000, imports £680,000. After 1914 the cultivation of maize, cotton, sisal and cocoa increased—the cocoa exported in 1919 was worth £140,000, the cotton £120,000.

Togoland was the only German protectorate in Africa which had become self-supporting, revenue rising from £132,000 in 1909 to £169,000 in 1913. The Germans levied a poll tax of 6 marks on the natives; on the Allied occupation direct taxation was abolished. Under the British and French the respective portions of Togoland continued to be self-supporting. The British portion was attached to the Gold Coast Colony, the French portion to Dahomey. Local autonomy was preserved. In Aug. 1920 the French established in their area an administrative council, on which non-officials, including one native, had seats, with a consultative voice in drawing up the budget.

See *Togoland* (1920) a British Foreign Office handbook, with bibliography, and for the 1914 campaign the British White Paper *Correspondence relating to the military operations in Togoland* (Cd. 7872, 1915). See also A. F. Calvert *Togoland* (1918). (F. R. C.)

TOKUGAWA, YOSHINOBU [KEIKI], PRINCE (1837–1913), Japanese statesman, was the last Shogun of the Tokugawa Government (*see* 26.1047), succeeding the 14th Shogun, Iemochi, in 1866. At that time already a man of matured intellect and high capacities, although his succession had been obtained by the conservatives, he soon displayed an advocacy of liberal progress. He showed great diplomatic tact in the solution of the feuds between the Satsuma and Chosu, and also in opposing the anti-foreign agitation supported by the latter. Realizing after a year's time that the proper government of the country was impossible if continued on the lines of feudalism, which was a bar to all progress and a source of continual internal strife, the Shogun handed in his resignation to the Emperor on Oct. 14 1867. This act of sacrifice was the prelude to the dawn of the enlightened Meiji era at the beginning of 1868. The anti-foreign agitation ceased, the Emperor received and treated as honoured guests the representatives of foreign Powers, and Japan was thrown open to the world. Tokugawa, having renounced his shogunate rights, retired to a strictly private life from which he never emerged. He even renounced the succession to his title for his direct heir in favour of a collateral branch of the family. The Emperor Meiji accepted that renunciation, but he gave him another title of prince to be bequeathed to his own son.

---

[1] It may be noted that the Colonial Office attempted to direct the movement of troops on the Gold Coast from London. Capt. Bryant, however, "did not see fit" to modify his plan of operations.

TORONTO (*see* 27.52), the chief city of Ontario, Canada, is the second city in size in the Dominion. In 1911 its pop. was 376,538; in 1921 the estimated pop. was nearly 600,000. Canada's greatest manufacturing district centres about Toronto. The city contained in 1921 about 1,400 factories employing 85,000 hands and producing goods annually to the value of $300,000,000. The bank clearings in 1920 amounted to $5,410,214,802, Montreal being the only Canadian city that surpassed Toronto in this respect. Fourteen of the chartered banks of Canada had their headquarters in Toronto in 1921.

Buildings erected since 1911 include St. Paul's Anglican Church, a fine edifice in the early English Gothic style, seating 3,000 persons; the Timothy Eaton Memorial Church, the greatest architectural ornament of Canadian Methodism, erected by the Eaton family at a cost of nearly $1,000,000; a 20-storey office building by the Royal Bank of Canada; a similar building by the Canadian Pacific railway, and several buildings for the university of Toronto. For several years preceding 1921 a large new Union station was under construction, and in that year was close to completion.

The Toronto hydro-electric system is one of the largest municipal supply undertakings on the continent of America. The management of the distributing system of the city was vested in 1911 in a board of three commissioners. The history of the enterprise has been one of phenomenal growth. Over 171,000,000 k.w. hours were sold during 1917 with a connected load of over 169,000 H.P.

The total assessed property in the city in 1919 was $642,816,090, an increase of 900% since 1885. A project was under way in 1921 for the building of a 63 m. boulevard driveway by the municipality. The main boulevard which would be 33 m. long and from 100 to 500 ft. wide would completely encircle the city. Toronto took over its own street railways from a private company in 1921, and has since operated them for the benefit of the municipality. The Toronto Exhibition, the largest annual exhibition held on the continent of North America, drew 1,201,000 visitors in 1919. The construction of the Welland Ship Canal, which was in hand in 1921, was expected to make the port of Toronto accessible to the larger vessels plying on the Upper Lakes. A scheme for the development of the harbour, which had been begun previous to 1917, was well under way in 1921. The project included the reclaiming of Ashbridge's Bay, known now as the Harbour Terminal Industrial District, the improving of the waterfront, the deepening of the harbour, and the construction of permanent breakwaters and concrete piers.

Toronto University has benefited greatly by large gifts from Sir John and Lady Eaton, Sir Edmund Osler and Sir Joseph Flavelle. In connexion with it a School of Engineering Research was founded in 1917 and a Faculty of Music was inaugurated the same year. A department of Social Service was founded, and in war time the university established courses for the training of masseuses that drew students from all over Canada. Hart House, a magnificent building in the Gothic style, was built by the university during the war and housed a number of war activities. It contains quarters for both the students' and Faculty unions, a dining hall, a gymnasium, a theatre and extensive offices for undergraduates' use. Dormitory residences were secured for students in the departments of Political Science and Medicine, and new residences were opened for woman students. An Electrical Engineering building, to cost $350,000, was under construction in 1921, and a University Press was also being built. The attendance at Toronto University in 1921 was well over 5,000, the highest university attendance in the British Empire.

TORPEDO (*see* 27.53).—In the World War of 1914–8 the torpedo played a most important part, especially as employed by the German submarines during the "ruthless" submarine campaign, which reached its height in April 1917, when enormous losses were caused by it to British and Allied merchantmen and fishing vessels. The total losses of British merchant ships due to submarines during the period Aug. 1914 to Nov. 1918 amounted to over six and a half million tons, and a very large proportion of this can be ascribed to torpedoes. In addition, British naval losses by torpedo over the same period included:—6 battleships, 5 cruisers, 3 light cruisers, 10 leaders, T.B.D's and T.B's, 4 submarines and 36 miscellaneous craft. Among these were H.M.S. "Goliath," a battleship of 12,950 tons, sunk by a Turkish T.B.D. in May 1915 in the Dardanelles. That the torpedo menace largely influenced Adml. Jellicoe's tactics at the Battle of Jutland is plain from his own book (*The Grand Fleet, 1914–1916*). At Jutland the Germans on their side sustained considerable loss or damage from torpedoes; the battleship "Pommern" and the light cruisers "Frauenlob," "Wiesbaden" and "Rostock" were sunk in this way, and 10 other ships were hit, three of which subsequently sank from other causes. The Germans fired between 60 and 70 torpedoes during the action and obtained two hits, one on the "Marlborough" and one on the "Shark"; the latter ship was sunk.

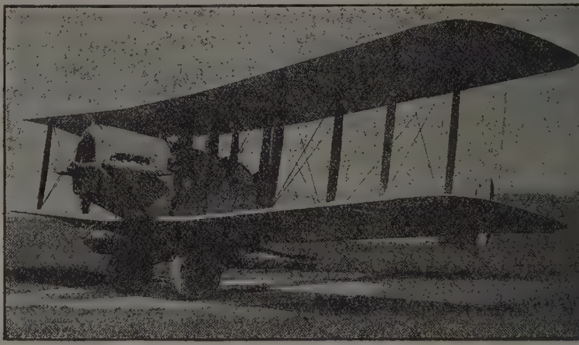

FIG. 1.—Aeroplane carrying torpedo.

Apart from their use of the torpedo by larger ships, torpedo-boats and destroyers, the World War saw them also made the weapon of the coastal motor boat (C.M.B.), the development of which in 1916 had been made possible by the installation of the internal combustion engine. The first operation on record carried out by British C.M.B's armed with torpedoes was an attack on German T.B.D's off Ostend, several destroyers being sunk. These C.M.B's operated from Dunkirk. Subsequently C.M.B's were extensively used off the Belgian coast, and played a most important part in the blocking operations at Zeebrugge. They were also largely used in the Baltic (notably at Kronstadt) and Caspian Seas, and also at Murmansk.

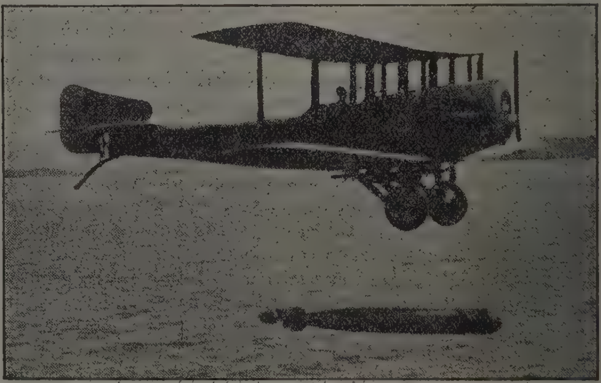

FIG. 2.—Discharge of torpedo from aeroplane.

A more novel use was the discharge of torpedoes from aeroplanes (*see* figs. 1 and 2). It is claimed that this was first accomplished in 1911 by an Italian, one Capt. Guidoni, who released a 350-lb. torpedo from an 80-H.P. Farman machine. In the same year the matter was taken up by various British naval experts who realized the possibilities of this form of attack from the air. Notable amongst these was Comm. (later Adml.) Murray Sueter. Adml. Fiske of the U.S. navy was also writing on the subject as early as 1912. By the end of 1913, the first British flight was carried out with a Sopwith seaplane carrying a 14-in. torpedo off Calshot, Southampton, and special machines were subsequently ordered by the British Admiralty. During 1914 experiments were proceeded with using "Short" seaplanes, and a specially light torpedo was designed for aircraft purposes. When the World War broke out, it was realized that means would have to be provided to carry the torpedo planes into proximity to their objectives, and H.M.S. "Engadine" and "Riviera" were fitted out for North Sea operations. Later, in May 1915, H.M.S. "Ben-my-Chree" was sent out to the Dardanelles as an aircraft carrier. She carried two torpedo seaplanes, in addition to reconnaissance aircraft. In 1916–7 the first torpedo planes were produced capable of flying off a ship's deck. About this time British naval authorities became convinced of the value of torpedo aircraft, and a large number were ordered. Delivery commenced in 1918 concurrently with special training of torpedo plane pilots, and in Oct. H.M.S. "Argus" embarked the first completed squadron of torpedo planes. In the first instance, experimental work was concentrated at Felixstowe in 1916, and in 1917 a torpedo seaplane school was established at Scapa Flow, which latter station was closed down after the Armistice. A torpedo seaplane school was also opened at Gosport, and experimental work and training is now carried out from here, pilots being embarked from time to time on board the aircraft carriers attached to the fleet.

In Aug. 1915 an attack was made on a 5,000-ton merchant ship by a short torpedo seaplane from H.M.S. "Ben-my-Chree" in the Dardanelles. A hit was obtained amidships, and spray and flying fragments observed. A few days later three Turkish ships at anchor were attacked, one being hit and subsequently gutted by fire, though the hull was salved. In the early part of 1917, the Germans, who had a squadron of torpedo planes at Zeebrugge, made several attacks on British merchant ships in the Downs. Three were sunk and one enemy aircraft shot down.

Construction.—In the British service the 18-in. and 21-in. torpedoes are the only sizes now made; the former are supplied for use in submarines, C.M.B.'s and aircraft, and the latter in capital ships, light cruisers and destroyers.

Constructed of steel plating, except for the air chamber, and of circular cross section, the profile of the torpedo is cigar-shaped, with a blunt-shaped head, a parallel portion and a fine run aft to the tail. Commencing from the forward end, the torpedo is divided into six compartments:—the head, the air vessel, the balance chamber, the engine room, the buoyancy chamber, the tail. These may be described as follows. (1) *The Head.*—There are two types, the War-head containing the explosive and the Collision-head used for practice. The former carries a charge of T.N.T. which is detonated on contact by a device known as the pistol, through the medium of a detonator of fulminate of mercury and a suitable priming charge. The pistol itself consists of a metal body which is screwed into the War-head and carries a striker which has externally projecting arms. On one of these arms, coming into contact with any object, the striker is forced in against the resistance of a shearing pin (which is provided for safety), and the detonator is struck. This in turn detonates the "primer" and the main charge. In the case of the "net cutter," used when attacking ships protected by nets, the action is similar, but the cutter is provided in addition with sheering devices for cutting through the meshes and opening up a hole sufficiently large to enable the torpedo to pass through. Nets are not now carried by modern capital ships of any nation, but the net cutter might be of use against net-defended bases. The Collision-head, used for practice, is a steel shell partially filled with cork to insure buoyancy in case of impact with a target ship. It is brought up to approximately War-head weight by filling it with water before practice running, and is so constructed that, on hitting, the fore part collapses, thereby lessening the blow on the plating of the ship and the shock on the torpedo itself. To facilitate recovery, an indicating light is fitted in a pocket in the Collision-head, consisting of phosphide of calcium in a tin container. On coming in contact with water this chemical has the property of spontaneously bursting into flame, which shows on the surface, thereby indicating the position of the torpedo. (2) *The Air Vessel.*—This consists of a special nickel-steel forging containing the compressed air which provides the motive power of the torpedo. It is closed at either end by special dome-shaped pieces, screwed and sweated into place. To the sides of the vessel are secured the lugs or brackets which take the weight of the torpedo in the case of above-water discharges and the stresses on the torpedo on discharge from submerged tubes. (3) *The Balance Chamber* is rivetted and sweated on to the after end of the air vessel, and forms a watertight compartment which contains the depth-keeping mechanism, the heater apparatus and the supply of fuel (either alcohol or petroleum in some form) in a special flask. In this compartment is also situated the charging valve and the stop valve in the main air pipe, which enables pressure to be isolated when it is necessary to remove the after part of the torpedo for examination of engines, etc. The depth-keeping mechanism, Mr. Whitehead's secret, consists of a pendulum weight and a hydrostatically operated valve, linked together by rods in such a manner that the weight corrects departures from the horizontal trim of the torpedo, whilst the valve keeps the torpedo at its set depth. Their joint action operates the horizontal rudders of the torpedo through the medium of a small air engine termed the servomotor. (4) *The Engine Room* is the next compartment abaft the balance chamber. It is not watertight, and together with the "buoyancy chamber," to which it is rivetted and sweated, forms what is known as the "afterbody." This portion of the torpedo is secured to the "air vessel—balance chamber" portion by a number of screwed bolts, which allows of the torpedo being easily "parted" for examination of the mechanism in the engine room. This mechanism consists of: (*a*) the engines, which are of the single-acting four-cylinder Brotherhood type; (*b*) the steering engine or servomotor; (*c*) the starting valve and counter gear; (*d*) the reducing valve, which maintains a constant reduced working pressure at the engines, irrespective of the air-vessel pressure, thus insuring an approximately constant speed throughout the set range; (*e*) oil bottles for lubricating various working parts. The starting valve is operated by an air-lever which projects through the shell of the torpedo and is thrown aft by a downward projecting bolt in the torpedo tube on discharge. In addition to opening the starting valves, the air-lever in its backward movement presses against a rod which releases the gyroscope. The counter gear, which is mounted on the starting valve casing is a piece of mechanism driven off the engines for stopping the torpedo at a pre-determined range. Off the counter is also driven the ignition gear, whose function is to fire the cordite igniters in the "heater" arrangement at a pre-determined moment, and start the combustion of the air and fuel. In the earlier torpedoes, the counter also operated the "sinking gear." This gear can be set to "float" for practice or "sink" for action and when set for the latter adjustment a small valve is lifted at the end of the run and water is admitted into the buoyancy chamber, thus sinking the torpedo, which might otherwise remain a dangerous floating mine. (5) *The Buoyancy Chamber* provides a large proportion of buoyancy of the torpedo, and consists of a thin sheet-steel shell, strengthened up by internal angle rings, to enable it to withstand external pressure, due either to immersion at great depths or to impulse pressures on discharge. To the foremost bulkhead of this compartment are secured the engines. Two watertight tubes run through it, one centrally carrying the propeller shaft, and the other to one side carrying the rod connecting the servomotor or steering engine, and the horizontal rudders. The sinking valve is on this bulkhead. The remaining fittings in this compartment consist of the gyroscope which is fixed to suitable brackets secured to the shell, and the gyroscope rudder rod, which passes through a watertight gland in the after bulkhead. A watertight removable door is also fitted at the bottom of the chamber to obtain access to the gyroscope. This piece of apparatus consists of a comparatively heavy bronze wheel, delicately mounted in ball bearings in an inner horizontal gymbal. This in turn is mounted in an outer vertical gymbal capable of rotational movement within the framework of the instrument. The wheel is initially spun at a high rate of revolution about its axis in the inner gymbal, due to the release of a strong spiral spring in torsion. This release takes place when the air-lever is thrown aft on discharge, after which the whole system of wheel and gymbals is freed from external constraint. The design is such that all axes of rotation of wheel and gymbals meet in a common point at the centre of gravity of the wheel. Consequently, in theory, if the instrument is in adjustment there are no external forces acting on the wheel or system except friction and windage, and, following the well-known dynamical laws of rotating bodies, the spinning axis tends to maintain its direction in space no matter how the apparatus is moved bodily. Practically, of course, slight errors do creep in, due to minute manufacturing differences, etc., but if the gyroscope is in good condition, the effect of these is barely noticeable until the initial wheel speed has dropped considerably. It will therefore be seen that the axis of the spinning wheel provides a datum line, the direction of which is the direction of the gyro wheel on release, *i.e.* in the longitudinal axis of the tube and torpedo. Subsequent deviations of the torpedo from the correct line in a horizontal plane, cause relative movement of the spinning axis, and fore and aft line of the torpedo. These relative movements are communicated to a delicate rotary valve through the medium of a small pin mounted on the outer gymbal. This rotary valve controls the air supply to a small steering engine which operates rudders on the vertical fins, so bringing the torpedo back to its original direction. (6) *The Tail* is a non-watertight conical steel shell carrying the horizontal and vertical fins and rudders. The fins are fixed to the tail and the rudders are carried in suitable brackets on their after edges. This portion of the torpedo also contains the gearing which enables the two four-bladed propellers to be driven in opposite directions off the same engine. The provision of two propellers is necessary in order that the torpedo shall remain upright during the run, and these are so shaped that the turning effect of one is balanced by that of the other.

The Director.—The name of "director" is given to the sight by means of which the firing officer is enabled to fire the torpedo at the correct moment. This he does by pressing a key which completes the circuit of the electrical portion of the firing gear at the tube. There are a number of types of sight extant, each of which has been designed to suit special conditions, chiefly as regards environment, *e.g.* the director on an above-water tube in a torpedo-boat destroyer, the director in the conning tower of a capital ship, etc. The same underlying principle obtains in every case. Suppose, a torpedo be discharged (*see* fig. 3) from A so as to hit a ship steaming in the direction BC at C. B is the position of the enemy ship at the moment of firing. Completing the triangle on a convenient scale, clearly

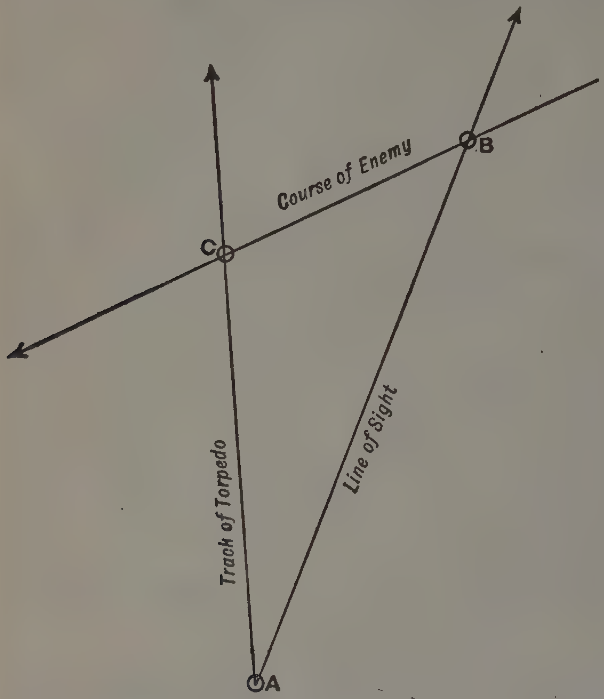

Fig. 3.—Diagram illustrating the principle of the Director Sight (A) on own ship at moment of firing, (B) target ship at moment of firing, (C) position of target when torpedo hits.

AC is to BC as "speed of torpedo" is to "speed of sailing"; and AB is the line of sight, its length and direction representing the velocity and direction of the torpedo relative to the target. Alternatively AC is to BC as the "running range of torpedo to hit" is to the "distance the target moves during time of flight of torpedo," and the length of AB is a measure of the firing range. In addition, if AC is taken to represent the maximum running range of the torpedo, the length AB is a measure of the maximum "possible shot" range under a given set of conditions as regards enemy speed and course. If the range-finder range when the sights come on is greater than that represented by the length AB, the torpedo will not reach its objective. It is obvious that a set of three bars, arranged so as to be capable of sliding and pivoting over each other, provide a torpedo sight which can be graduated so that the possible shot range can be read off direct after the sight is adjusted and torpedo fire withheld if necessary. Earlier types actually took this form, a foresight being fitted at the B end of the bar AB and a backsight at A.

It will be seen that the chances of obtaining hits with torpedoes are almost entirely dependent on the correct estimation of the enemy's course and speed, and the officer handling the instrument has to be a highly skilled specialist in these duties. It will also be seen that the *effect* of errors in estimation will vary in direct proportion to the number of ships comprising the target, and to the running range to obtain a hit, and are inversely proportional to the speed of the torpedo, for any particular speed of enemy. It is therefore clear that attacks on single ships under way are not likely to be successful unless carried out at short range, and that to insure success against an enemy fleet at long range, it is necessary to fire a large number of torpedoes. A large proportion of these will be wasted, but a torpedo-infested zone will result, which the enemy will find difficult to avoid, unless he is prepared to make large alterations of course, and these will undoubtedly affect the efficiency of his gunfire very seriously. The most obvious way of producing these torpedo-infested zones is to employ large numbers of torpedo-boat destroyers against the enemy, but this must not be considered to be an argument for the abolition of torpedo tubes in big ships, the mere fact that torpedoes are carried by opposing capital ships having a considerable bearing on the tactics employed and the ranges at which the action is fought. (W. M. M. R.)

TOSTI, SIR FRANCESCO PAOLO (1846–1916), composer and teacher of singing, was born at Ortona, Abruzzi, April 9 1846. He began his musical studies at Naples at the age of 14. In 1876 he paid his first visit to England; five years later he was appointed teacher of singing to the Royal family and settled in England. He published many songs, which from the first had a wide success, the most famous being "Goodbye," "Ask Me No More," and "For Ever." He was knighted in 1908. He died at Rome Dec. 2 1916.

TOURNEUX, JEAN MAURICE (1849–1916), French man of letters (*see* 27.107), died in Paris Jan. 13 1916.

TOWNSEND, MEREDITH WHITE (1831–1911), English journalist, was born at Bures, Suffolk, April 1 1831, and educated at Ipswich grammar school. In 1848 he went out to India, and four years later became editor of the *Friend of India*, acting also for some years as *Times* correspondent. In 1860 he returned to England and purchased the weekly *Spectator* (*see* 19.562). With R. H. Hutton he was joint-editor until 1898, and he was largely instrumental in making it an established success, writing most of the political articles and the opening paragraphs every week. His two chief publications were *The Great Governing Families of England* (1865), written in conjunction with Langton Sanford, and *Asia and Europe* (1901). He died at Little Bookham, Surrey, Oct. 21 1911.

TOWNSHEND, SIR CHARLES VERE FERRERS (1861–), British general, was born Feb. 21 1861, and joined the Royal Marines in 1881. He served at Suakin in 1884, and in the Nile expedition of the following year. He joined the Indian army in 1892 and was present in the Hunza-Nagar operations of that year. He greatly distinguished himself by his gallant defence of the Chitral fort during its prolonged siege in 1895, for which he was rewarded with the C.B. and a brevet majority. Then, in 1897–8, he served with the Egyptian army in the reconquest of the Sudan and won the D.S.O., shortly after which he was transferred to British Infantry. He served for some months in the field during the S. African War, was promoted colonel in 1904, was for some time on the staff in India, afterwards commanded a district in S. Africa, and was promoted major-general in 1911. He was then for some months in charge of a Territorial division at home, after which he went to India to command a brigade.

In April 1915 he was sent to Mesopotamia to take over command of the 6th (Indian) Division in that theatre of war. Aided by some other troops his division worked its way up the Tigris, driving the Turks out of more than one fortified position, and on Sept. 28 Townshend signally defeated the enemy near Kut-el-Amara and occupied the town, while detachments pursued the enemy halfway to Baghdad; shortly afterwards he was instructed to advance and occupy that city. On the move being made, he encountered the enemy in superior numbers at Ctesiphon, and after severe fighting was obliged to effect a retreat of 120 m. to Kut, and there he and his force were speedily hemmed in. A skilful and resolute defence was made, lasting 143 days till the end of April 1916 but then, supplies being exhausted and all efforts at relief having failed, he was obliged to capitulate. He was rewarded with the K.C.B. for his services. He remained a prisoner of war near Constantinople until Oct. 1918, when he acted as intermediary between the Porte and the Allies in adjusting the Armistice. He retired from the army in 1920, and entered Parliament as member for the Wrekin division of Shropshire.

TOY, CRAWFORD HOWELL (1836–1919), American Hebrew scholar (*see* 27.114), died in Cambridge, Mass., May 12 1919. In 1913 he published *Introduction to the History of Religions*.

TRACTORS.—The petrol tractor for agricultural and kindred purposes is a development of the steam traction engine, widely used for operating grain threshers and to a small extent for ploughing. Steam ploughs were used toward the end of the 19th century on the large ranches of the north-western section of the United States, in Canada and in Egypt. Their usefulness was limited, however, owing to their great weight, which resulted in the packing of the soil and in rather inefficient operation. When the weight of the petrol engine was greatly reduced by motor-car engineers, about 1900, the idea of substituting that type for the heavy steam plant naturally suggested itself.

The first petrol tractors seem to have been those built by the Huber Mfg. Co., of Marion, O., in 1898. These were not successful and only 30 were completed. In 1901 the Hart-Parr Mfg. Co., of Charles City, Ia., engaged in the manufacture of petrol tractors, and, although this company met with many difficulties, it was successful and, after 19 years of continuous manufacture, produced in 1920 5,000 tractors. There are two general types of agricultural tractor, the wheeled and the crawler, or caterpillar, types. The crawler type, in which the weight is spread over a large supporting surface on the ground, can pass over marshy land where the wheeled tractor would be mired, and when used for pulling barrows, seeders and other implements over ploughed ground, does not pack the soil as a wheeled tractor would. Early technical development was chiefly toward large tractors, designed to operate from 6 to 12 plough bottoms, because the only farmers who then took an interest in tractors were the owners of large ranches in western America. The largest producers of petrol tractors in the United States between 1905 and 1913 were manufacturers whose main line was general agricultural machinery and steam traction engines, such as the International Harvester Co., the J. I. Case T. M. Co., and Emerson-Brantingham Co. The large petrol tractors of that period were crude in design and very heavy; their frames were built up of heavy rolled channels, and they had driving wheels of enormous diameter. Their great weight naturally rendered them inefficient, for a large proportion of the engine power was consumed in moving the tractor itself. The oil-pull tractor shown in fig. 1 is characteristic of tractors of that period.

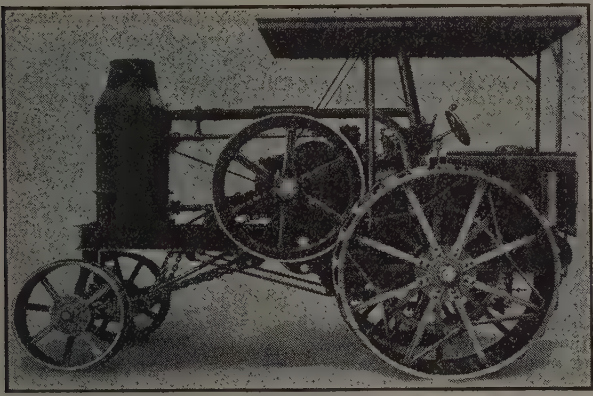

FIG. 1.

Agricultural Tractors.—Tractors are usually rated in terms of the number of 14-in. plough bottoms which they will pull. In 1920, of 100 models on the American market capable of pulling two or more bottoms, 20 were two-plough tractors; 42 three-plough; 17 four-plough and the rest were capable of pulling five or more ploughs. Table 1 shows the production of tractors in the United States each year from 1909 to 1920.

Table 1. Tractor Production in the United States.

1909	2,270	1915	21,900
1910	4,500	1916	29,670
1911	7,400	1917	62,742
1912	11,400	1918	132,697
1913	7,450	1919	136,162
1914	10,400	1920	203,300

According to a statement issued by the Ministry of Transport, there were 10,161 agricultural tractors in the United Kingdom in 1921. Of the tractors produced in the United States 14,854 were exported in 1917, 36,351 in 1918, 19,693 in 1919, and 29,143 (valued at $30,850,000) in 1920. It will be seen from the above table that a slump in tractor production occurred in 1913. It was in 1912 that the business in the large tractors of 6-to 12-plough capacities reached its zenith, and thereafter it declined rapidly. The first popular small tractor, the Bull, was brought out the following year, and in 1914, no fewer than 3,000 tractors of this make were sold. Although smaller, it was still of the same crude design as the larger machines, with exposed gears, plain bearings and similar features. About 1916 a number of engineers with motor-car experience entered the tractor field, and as a result of their efforts tractor design was greatly improved. Before 1920 many farm tractors were designed to use paraffin as fuel, because paraffin was considerably cheaper than petrol, and the conditions of engine operation on a tractor (constant speed and steady, heavy load) made it comparatively easy to burn paraffin with a moderate degree of success. Petrol, however, proved much more satisfactory in the average engine, and when in 1919 the price of paraffin advanced sharply, tractor users generally turned to petrol. The consumption of petrol in gallons per acre is less, there is less difficulty in cold weather and the oil in the crank case does not lose its lubricating value so quickly. For the sake of economical manufacture many of the earlier small tractors were made with only three wheels, but the buying public did not approve of this feature of construction, and the typical 1920 wheeled tractor had four wheels, two in front steering and two in the rear for driving. The Twin City 12–20 H.P. tractor shown in fig. 2 is a good example of the lighter tractors based on motor-car practice. The following is a composite description of a 1920 model three-plough tractor, the features mentioned being those found on the greatest number of models of this capacity; there was a four-cylinder, four-stroke vertical engine at the front, of about $4\frac{3}{4}$-in. bore by 6-in. stroke, adapted to burn either petrol or paraffin. Ignition was by a high-tension magneto with impulse starter. (The latter device consisted of a spring attachment for magnetos specially developed for use on tractors, which made it unnecessary to "spin" the heavy engines in order to generate a spark in the magneto.) The carburetor was fitted with an air cleaner, which prevented gritty dust from getting into the engine and rapidly wearing out the cylinder barrels. These air cleaners usually acted on the centrifugal principle, but in the lava-ash districts on the Pacific coast it was necessary to employ air washers, owing to the lightness of the dust. Behind the engine there was a friction clutch, and then came the change-speed gear, which gave two forward speeds and one reverse. The higher forward speed was for regular use in ploughing and the lower for emergencies, for ploughing up steep inclines, in heavy soil, etc. Then there was a further reduction by gears to the rear axle. The engine speed was limited by a governor to about 800 revolutions per minute, and as the ploughing speed was about $2\frac{3}{4}$ m.p.h., with 48-in. driving wheels, a reduction of roughly 40 to 1 had to be provided between engine crankshaft and rear axle or rear wheels. In the early tractors the final drive was through exposed bull gears directly on the driving wheels, but the typical 1920 tractor had all its gearing enclosed and protected from dust and mud, which is an important feature in a machine operating in the fields during the wet season as well as when the soil is dry and dusty. The wheelbase of the tractor was 96 in. and its weight about 5,000 pounds. The wheels were built up of rolled rims and flat spokes riveted to the hubs and rims. The driving wheels were provided with angle-iron lugs to increase the traction, and the front wheels with central skid rings to make the steering more positive. The front axle was swivelled to the frame at the middle, to permit the wheels to accommodate themselves to uneven ground. In addition to the pivot joint a spring could be used between the axle and the frame at the front to relieve shocks. These 1920 tractors were provided with a belt pulley for operating threshing

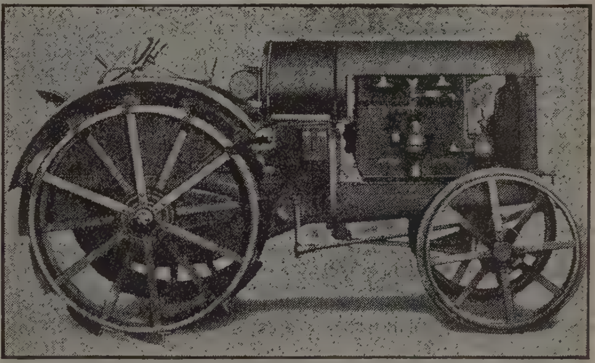

FIG. 2.

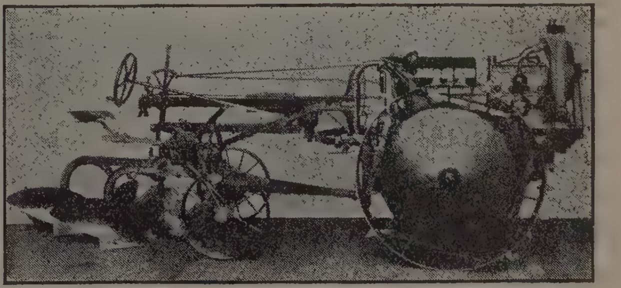

FIG. 3.

machines, wood saws, silo fillers, etc. It was customary to apply a double horse-power rating; for instance, a three-plough tractor was often rated as a 12–25 H.P. machine. This signified that the tractor could develop 25 H.P. on the belt and 12 H.P. on the drawbar, the difference of 13 H.P. being required for moving the tractor itself over the field. In 1917 the Society of Automotive Engineers standardized tractor belt speed at 2,600 ft. p.m. and the drawbar height at 17 inches. Another class of wheeled tractor, having only two wheels, is exemplified by the Moline Universal illustrated in fig. 3. This is intended for cultivating as well as for ploughing and similar work, and has the necessary clearance to pass over plants 2 ft. or more high. Another feature is that, by means of an extension to the control apparatus, it can be operated from the implement drawn, thus dispensing with the need for an extra man in operating a self-binder, for instance. The crawling tractor had one or two continuous-chain tracks on which it ran and which it carried with it. That portion of the chain track in contact with the ground had transverse projecting bars or depressions which caused it to grip the ground firmly, while the upper side of the lower portion of the chain formed a smooth track on which rolled idler wheels carried on the frame of the tractor. The power from the engine was transmitted through a suitable reduction gear to a pair of toothed wheels which engaged with teeth or rollers on the inner side of the track and, when power was applied by letting in the clutch, the tractor rolled ahead on the track and the track at the same time rolled forward. The power was applied to the two chain wheels through a differential gear, and in order to steer a tractor of this kind, one track was held stationary by means of a brake on the shaft of its chain wheel, while all the power was applied to the other chain wheel. The Cletrack tractor shown in fig. 4 was one of the smallest tractors of this type. Much of the development work in connexion with crawler tractors was done in California, where the Holt, the Best and the Yuba, all tractors made in large sizes, originated. The Holt, which is called a Caterpillar, became the prototype for the "tanks" which played such an important part in the World War. In 1920 many of these large crawler tractors were used for other than agricultural purposes—for example, in oil-fields, in lumbering and in road-building; and the city of New York that year purchased a large number for use in clearing the streets of snow. The lumbering or logging work done was mainly in swampy districts where previously it had been impossible to work with horses except in winter when the ground was frozen, whereas the crawler tractor made logging in such districts possible the year round. The weight on the track of a crawler tractor of the 1920 type was as low as 5 lb. per sq. in., and such a tractor could go into boggy places where no wheeled vehicle could follow.

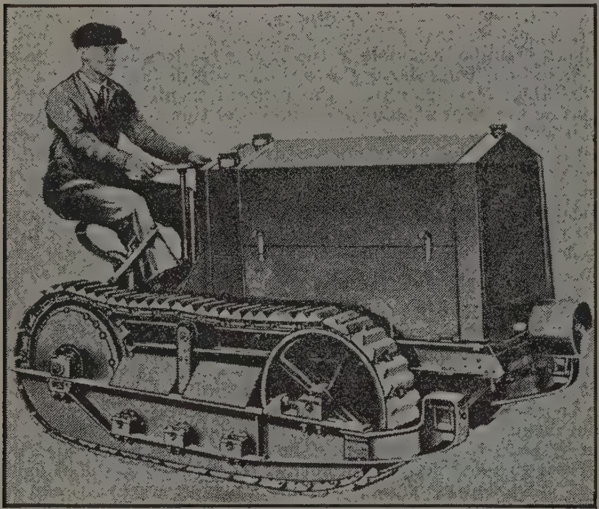

FIG. 4.

In 1919 the Legislature of the state of Nebraska passed a law providing that thereafter no tractor should be sold in that state until the manufacturer had first submitted a sample tractor for trial to the Agricultural Engineering Department of the university of Nebraska and the tractor had satisfactorily met the test required. The manufacturer must also satisfy the state authorities that he is maintaining an adequate supply of repair parts within the state. This legislation was the result of complaints of farmers that manufacturers were overrating their tractors. The result was that, during a period when 66 tractors were tested, the makers of 8 were compelled to increase their rated engine speed, 13 lowered their horse-power rating, 14 changed some part and 4 withdrew.

Cost of Tractor Ploughing.—The three chief items of cost in tractor ploughing are fuel, depreciation and labour. At the tractor trials held at Lincoln, England, in the autumn of 1919, the fuel consumption per ac. averaged almost exactly 4 imp. gal. for ploughing in heavy clay soil, and 3 gal. for ploughing on cliff lands. In the corn belt of the United States, where the soil is comparatively light, it has been customary to reckon on a fuel consumption (either petrol or paraffin) of 2·5 U.S. gal. (2 imp. gal.) per acre. On the other hand, in a bulletin of the U.S. Department of Agriculture on "The Gas Tractor in Eastern Farming," a fuel consumption of 3½ U.S. gal. per ac. is made the basis of cost calculations of the eastern section, and in the tractor trials held at Harrisburg, Pa., in 1919 the average fuel consumption of all tractors using paraffin worked out at 3·28 U.S. gal. (2·62 imp. gal.) per acre. The fuel consumption in tractor ploughing varies both with the character and condition of the soil and with the depth of ploughing. The average depth of ploughing at Lincoln was 5¾ inches. The resistance of the soil (drawbar pull) averaged 11·5 lb. per sq. in. for the heavy clay soil and 9 lb. per sq. in. for the cliff land. In the corn belt of the United States the soil resistance generally varies between 5·5 and 7 lb. per sq. in., and this explains the low fuel consumption in ploughing there. The estimate here given of the cost of ploughing one acre is based on the results of an inquiry by the U.S. Department of Agriculture among 400 tractor farmers in the Dakotas concerning their experiences in 1917 and 1918. Only one change is made from the estimate of the department, namely, the assumption of a tractor life of seven instead of nine years, which latter figure is admittedly too high. The answers to the questionnaire yielded the averages shown in Table 2.

Table 2. Average Cost and Performance of Tractor Ploughing in the Dakotas.

	Two-plough Tractors	Three-plough Tractors	Four-plough Tractors
First cost . . .	$1,050	$1,460	$2,000
Full working days per year.	45	52	64
Acres ploughed per 10-hr. day	6·3	8·5	10·9

Other factors on which the estimate is based are the following: Cost of petrol, $.276 per U.S. gal.; paraffin, $.152 per gal.; lubricating oil, $.50 per gal.; grease $.10 per lb.; repairs, 4% of first cost per year; depreciation on a 7-year basis; man labour at $4.00 per day; interest at 6% on the average investment (one-half of total investment). Such items as housing, insurance and taxes are neglected.

Table 3. Cost of Tractor Ploughing in the Dakotas 1917–8.
(Dollars per acre)

Size of Tractor	Total Cost of Ploughing		Fuel		Oil
	Petrol Tractor	Paraffin Tractor	Petrol	Paraffin	
Two-plough . . .	2·21	1·915	0·69	0·395	0·075
Three-plough . .	1·975	1·68	0·69	0·395	0·075
Four-plough . . .	1·757	1·462	0·69	0·395	0·075
Other Items					
	Grease	Repairs	Depreciation	Man Labour	Interest
Two-plough . . .	0·02	0·15	0·53	0·635	0·11
Three-plough . .	0·02	0·13	0·49	0·47	0·10
Four-plough . . .	0·02	0·11	0·409	0·368	0·085

With the data here indicated it is possible to make a close estimate of the cost of tractor ploughing under different conditions, as all the basic costs are given. The average soil resistance in the Dakotas may be assumed to be 8 lb. per sq. inch. In heavier soils the area ploughed per day will be less in substantially the inverse ratio of the soil resistance (provided the latter is not excessive). This is borne out by estimates of the ploughing capacities of the tractors which competed in the Lincoln trials of 1919, made by the judges of the event. Averaging the estimates for heavy clay soil (soil resistance 11·5 lb. per sq. in.), and reckoning on the basis of a 10-hr. instead of an 8-hr. day, the following results are obtained: Two-plough tractor, 4½ ac., three-plough tractor, 5⅝ ac., four-plough tractor, 6⅔ acres.

To the American and Canadian farmer the advantage of the tractor is not so much that it reduces the cost of ploughing as compared with horses, as that it enables one man to work a much greater acreage. Approximately one-third of several hundred tractor farmers in Illinois circularized by the U.S. Department of Agriculture had increased their acreage by purchasing tractors. Another great advantage is that the tractor permits work to be done quickly when the weather is favourable. For instance, a southern Illinois farmer estimates that in his neighbourhood the yield of Indian corn is reduced by 1 bus. per acre for every day that planting is delayed after May 8. In 1920 the spring was so wet that he was able to work in the field only the first day and the last day of April, not a day in between; but when the weather turned he was able, owing to his tractors, to get his crop in quickly.

Power farming has proved particularly advantageous in the wheat belt of Kansas. For the best yield the land must be ploughed in Aug., when the temperature is often above 100° F. in the shade and very little work can be accomplished with horses. The tractor works as efficiently at this temperature as in winter. Moreover, the tractor can be used also for threshing, and the old practice of contract threshing has been largely superseded by the plan of four or five farmers owning a small threshing machine coöperatively and helping each other thresh their grain, each using his own tractor as the motive power. A three-plough tractor is generally recommended for a 20x36 in. grain separator. Sometimes it is necessary to get a crop into the ground very quickly, and, with a double shift of operators, tractors can then be operated continuously day and night.

Interest in farm tractors increased greatly in Europe during and following the World War. In 1919 and 1920 tractor trials were held at Lincoln, England, the first under the auspices of the Society of Motor Manufacturers and Traders and the second under that of the Royal Agricultural Society. The French Government in 1920 paid a bonus of 25 % on the purchase price of tractors of domestic manufacture and 10 % on tractors of foreign manufacture. During the war the British, French and Italian Governments contracted for large numbers of farm tractors in the United States. In 1919 there was an international tractor demonstration and test at Säbyholm, Denmark, in which Danish, Swedish, German, British and American tractors were entered. Several demonstrations were also held in France in the years immediately following the World War; French engineers paid particular attention to tractors for use in vineyards, which must be very narrow. Those for use in orchards, on which a number of American manufacturers specialize, must be very low. A somewhat distinct type is the garden tractor for the cultivation of row crops and general work in market gardening. The Beeman, the first model of this type, was put on the market in 1915, and in 1919 about half a dozen other tractors of this type were brought out. For rubber-tired road tractors, see MOTOR VEHICLES; for artillery tractors, see ARTILLERY.

TRACY, BENJAMIN FRANKLIN (1830–1915), American soldier (*see* 27.127), died in New York City Aug. 6 1915.

TRADE BOARDS.—An important factor in the regulation of wages in England is now represented by the functioning of the trade boards. The Trade Boards Act of 1909 was passed, as a result of considerable agitation on behalf of workers who were employed under "sweated" conditions, with a view to providing machinery by which their wages might be raised to a more satisfactory level.

This Act applied at once to four trades, namely: (1) readymade and wholesale bespoke tailoring and any other branch of tailoring in which the board of trade considered the system of manufacture was generally similar to that prevailing in the wholesale trade; (2) the making of boxes or parts thereof made wholly or partially of cardboard, chip, or similar material; (3) machine-made lace and net finishing and the mending or darning operations of lace curtains and lace finishing; (4) hammered and dollied or tommied chain-making. Provision was further made that the Act should be applied to other trades by Provisional Order if the board of trade was satisfied that the rate of wages prevailing in any branch of those trades was exceptionally low as compared with that in other employments. These Provisional Orders required confirmation by Parliament.

In addition to the trades originally specified four trades were subsequently added under the Provisional Order procedure, making a total of eight. The small number of trades to which the Act of 1909 was applied was due partly to the fact that the procedure by Provisional Order was necessarily a slow and cumbrous process, and partly to the severe limits imposed by the provision that a board could only be established where wages were exceptionally low.

In 1918 an amending Act largely extended the scope of the previous Act. During the World War the whole basis of the payment of wages to women had been altered by the Orders made by the Minister of Munitions under Section 6 of the Munitions Act of 1916; and, for a number of women largely in excess of a million, the provisional rate at the conclusion of the war was in the neighbourhood of 7d. to 8d. per hour. It was recognized that if upon the return of peace the protection offered by the Munitions Acts was suddenly withdrawn a reduction of wages of a very disturbing character might ensue, and that it was desirable that the large number of persons, both men and women, in the unorganized trades, should have a similar measure of protection to that which had been already offered by the Trade Boards Act to those whom it covered.

The new Act made two amendments of a far-reaching character:—

(*a*) The minister was empowered to apply it to any specified trade "if he is of opinion that no adequate machinery exists for the effective regulation of wages throughout the trade, and that accordingly, having regard to the rates of wages prevailing in the trade, or any part of the trade, it is expedient that the Act should apply to that trade."

(*b*) In place of the procedure for application of the Acts by Provisional Order, provision was made for the making of a special Administrative Order, the latter a shorter process than the former, although revision of the minister's proposals by Parliament is still provided for.

Further amendments made by the new Act extended the powers of trade boards with regard to the classes of rates of wages which they could fix, and gave them also the right of requiring Government departments to consider any proposal concerning the conditions in their trade which they might care to make.

The effect of the new Act was to make the Acts applicable to a much larger area of industry and to render legislation no longer a means of protection for sweated trades only. This extension of the scope of the Trade Boards Acts, apart from its desirability, having regard to the special conditions likely to prevail during the reconstruction period, was recommended also by the Committee on the Relations between Employers and Employed, presided over by Mr. J. H. Whitley, M.P. This Committee subsequently recommended that, while joint industrial councils should be established for trades which were sufficiently organized to control their own wage matters, it was equally desirable that trade boards should be established for trades which had not yet reached that degree of organization on both sides which would make possible the complete observance of agreements arrived at between organizations. It was made clear that there was no conflict between the two forms of joint organization, and that each was adapted to and intended for a different degree of organization in the trades concerned. In practice the principle indicated by the Whitley Committee was the guiding principle in the establishment of joint industrial councils and trade boards.

A rapid extension of existing trade boards followed, with the result that, at the end of 1920, 49 additional trade boards for England, Scotland, Wales and Ireland had been set up in the following trades, covering about 3½ million persons:—

Great Britain.

Boot and shoe repairing.
Brush and broom.
Button making.
Coffin furniture and cerement making.
Corset.
Cotton waste.
Flax and hemp spinning and weaving.
Fur.
General waste.
Hair, bass and fibre.
Jute spinning and weaving.
Laundry.
Linen and cotton handkerchief, etc.
Made-up textiles.
Paper bag.
Perambulator and invalid carriage.
Pin, hook and eye and snap fastener.
[1] Retail bespoke tailoring.
Readymade and wholesale bespoke tailoring.
Rope, twine and net.
Stamped or pressed metal wares.
Tobacco.
Toy.
Wholesale mantle and costume.

England and Wales.

Aerated waters.
Dressmaking and women's light clothing.
Grocery and provisions.
Hat, cap and millinery.
Milk distributive.

Scotland.

Aerated waters.
Dressmaking and women's light clothing.
Hat, cap and millinery.
Milk distributive.
Grocery and provisions.

Ireland.

Aerated waters.
Boot and shoe repairing.
Brush and broom.
Dressmaking and women's light clothing.
Flax and hemp spinning and weaving.
General waste.
Hat, cap and millinery.
Laundry.
Linen and cotton handkerchief, etc.
Milk distributive.
[1] Retail bespoke tailoring.
Readymade and wholesale bespoke tailoring.
Rope, twine and net.
Tobacco.
Wholesale mantle and costume.

---

[1] Previously the Readymade Tailoring Trade Board (1909). In 1919 two new boards were constituted.

The Trade Boards Acts provide for the appointment of joint bodies, consisting of an equal number of employers' and workers' representatives, together with a minority, usually three or five, independent members known as appointed members. In trades in which women are employed one of the appointed members is a woman. The members of trade boards are all appointed by the Minister of Labour (originally the president of the Board of Trade), who, in the appointment of the employers' and workers' representatives, is bound to consult the organizations on each side respectively. The appointed members are impartial persons of standing nominated by the minister. The procedure of the boards is regulated by statutory regulations made by the Minister of Labour. Such regulations usually make provisions for a method of voting, and the regular reconstitution of the board; in all cases it is provided that no new appointment shall be made to the board by the minister until the board has had an opportunity of being heard. The boards are provided with secretarial assistance by the Ministry of Labour. They have power to form district committees for such areas as they may consider to be necessary, the members of which, like the members of the boards themselves, are appointed by the Ministry of Labour.

The boards are compelled, unless the Minister of Labour relieves them of the duty, to fix a general minimum time-rate for the workers engaged in the trades concerned. A trade board must also in certain cases fix special minimum piece-rates on the application of an employer. A board has power also, if it so desires, to fix general minimum piece-rates, guaranteed minimum time-rates, overtime-rates, rates for special classes of workers, rates for special areas, rates for special processes, rates for any class of work in any special process or in any special area and piece-work basis time-rates. Rates may be fixed so as to come into operation successively on the expiration of specified periods, or to be valid during a specified period. For the purposes of fixing overtime-rates a trade board may declare what are the normal number of hours in the trade during which ordinary rates of wages are payable, but they have no power to limit the number of hours worked.

In fixing a minimum rate so as to apply to any class of workers in a trade, a board may attach to the fixing of the minimum rate a condition that workers who are members of a class must be holders of a certificate from the trade board, or, if the persons are learners, such conditions as the trade board considers necessary for the instruction of these persons in the trade.

Decisions of trade boards come into obligatory operation by confirming order of the Minister of Labour, and the determinations of trade boards have no force until so confirmed. A board's proposals must be published for two months, during which time employers or workers may lodge objections. On the expiration of the two months the board may proceed to fix the rates. If, in the light of objections, they wish to make substantial alterations, they must issue new proposals. The rates when fixed are sent to the Minister of Labour, who must forthwith take them into consideration and, except in special circumstances, either make an order within a month making the rates obligatory or refer them to the board for reconsideration. By this procedure all those engaged in the trade are fully informed as to the proposals, and are given full opportunity of making observations on them, and, further, Parliament, through the Minister of Labour, can be assured that conditions harmful to the general interests of the community are not made binding by statutory rates. If district committees have been established, a trade board, before proposing rates, is compelled to give the district committee concerned an opportunity of being heard on the subject.

The Minister of Labour may at any time direct a trade board to reconsider rates of wages which may be in operation, although he has no power himself to fix rates of wages.

When rates of wages have been made operative they are enforced by inspectors appointed by the Ministry of Labour, and penalties for offences, such as non-payment of rates of wages, failure to post such rates, or keep records, are punishable by fine or imprisonment.

A trade board has power to exempt employers from the payment of minimum rates of wages in respect of workers who, through age or infirmity, are rendered incapable of earning the minimum time-rate, provided that the cases cannot suitably be met in the opinion of the board by employing the worker on piece-work.

Apart from the fixing of minimum rates of wages, the certification of learners and statutory and wage-fixing duties, the trade boards also act as joint consultative bodies for their trades, and have been so recognized by the Government for the purpose of advising them as to the training of disabled men, the training of apprentices, the settlement of disputes and other important matters.

In Sept. 1921 a Committee of Inquiry into the working of the Trade Boards (which was being severely criticized in various quarters) was appointed by the Ministry of Labour, under the chairmanship of Viscount Cave. (H. Wf.)

TRADE UNIONS (*see* 27.140*).—The history of Trade Unionism in the United Kingdom and in the United States, during 1911–21, is dealt with in detail, in separate sections, below; and in the various articles under country headings information regarding foreign countries will be found. The industrial unrest of the years immediately preceding the World War was not by any means confined to Great Britain, and in the chief industrial countries notable developments took place in the growth of trade unionism. Trade unions in such countries as France, Germany, Belgium and Austria, where the movement was of comparatively early growth, received large accessions of membership, and trade unions arose in other countries where any form of labour association had been hitherto unknown. Even before the war, however, there were certain notable exceptions. In Russia and Japan, for example, every form of trade union was illegal, and persons participating in trade union organizations did so at the risk of death or imprisonment. Trade unions, therefore, in those countries, either were secret associations working underground, or masqueraded under the guise of friendly societies or other bodies of a similar character. The war had many diverse effects on the various trade union movements. In the Central European countries the privations of the last two years of the war were reflected in a great falling-off in trade union membership. In Germany this was more than compensated for by the reliance of the Republican governments which followed the Armistice upon the help of the trade unions. This brought to the trade unions a great number of new members, with the result that in 1920 the German trade union movement was actually the largest in the world. In Hungary, on the other hand, the "White" government of the regent Horthy, which succeeded the short-lived Soviet republic of 1919, put down Trade Unionism with the utmost severity, some 70% of the leaders being executed. In the new States created by the Treaty of Versailles, trade unionism was in 1921 generally weak, owing to the existence of strong nationalist movements which absorbed the energies of the population; but in some, such as Czechoslovakia, having a large industrial element, there was a trade union movement of some size. In Russia, on the other hand, the trade unions were an integral part of the Soviet Government, and hence the inducement to the average workman to become a trade unionist was greater than in any other country.
